And my mother was standing in the back whispering loudly, 'Why he don't send me check, already two weeks late. So mad he lie to me, losing me money.' And then I said in perfect English, 'Yes, I'm getting rather concerned. You had agreed to send the check two weeks ago, but it hasn't arrived.' Then she began to talk more loudly. 'What he want, I come to New York tell him front of his boss, you cheating me?' And I was trying to calm her down, make her be quiet, while telling the stockbroker, 'I can't tolerate any more excuses. If I don't receive the check immediately, I am going to have to speak to your manager when I'm in New York next week.' And sure enough, the following week there we were in front of this astonished stockbroker, and I was sitting there red-faced and quiet, and my mother, the real Mrs. Tan, was shouting at his boss in her impeccable broken English.

What is at issue here is not just the grammatical incorrectness of the mother's English, but above all, her way of speaking – her loudness, her shouting, her emotional intensity, her "directness" (as Tan describes it), her inability to use understatement such as "I'm getting rather concerned."

Amy Tan's attitude to, and interpretation of, her mother's difficulties is in itself instructive, as it reflects aspects of the confusion and theoretical insecurity that have until recently plagued the field of intercultural pragmatics, and to some extent still do. On the one hand, the vignettes offered in Amy Tan's book clearly show differences between Chinese communicative norms and expectations and the Anglo-American ones, and throw light on cultural misunderstandings related to those differences. On the other hand, Tan, like many linguists of her generation, is clearly frightened of stereotyping, and she prefers to deny the reality, or at least describability, of cultural differences such as those between Chinese and American culture, professing instead her faith in human universals. And yet her own experience, conveyed with great talent in her books, clearly reflects the reality of those differences, and the urgent need for them to be described and widely understood – especially in countries where people of different cultural backgrounds have to live together. Thus, at times Tan's observations and intuitions as a writer come into conflict with the ideologies that can perhaps be traced to her linguistic education in the 1970s.

In the 1970s, the pragmatic scene was largely dominated by the search for the universals of politeness and for the universal maxims of conversation. The widely accepted paradigms were those of Brown and Levinson's (1978) theory of politeness, which affirmed "pan-cultural interpretability of politeness phenomena" (Brown and Levinson, 1978: 288), and Grice's theory of conversation, which posited a number of universal conversational principles.

In 1978, Brown and Levinson set out "to describe and account for what is in the light of current theory a most remarkable phenomenon. This is the extraordinary parallelism in the linguistic minutiae of the utterances with which people choose to express themselves in quite unrelated languages and cultures" (Brown and Levinson, 1978: 60). A quarter of a century later, it is increasingly widely accepted that this "extraordinary parallelism" was largely an illusion due to that "light of current theory." What is seen as more remarkable today is the extent of cross-linguistic and cross-cultural differences in ways of speaking. Brown and Levinson (1978: 61) described it as their goal "to rebut the once-fashionable doctrine of cultural relativity in the field of interaction" and "to show that superficial diversities can emerge from underlying universal principles and are satisfactorily accounted for only in relation to them." Their major conclusion was that "interactional systematics are based largely on universal principles" (Brown and Levinson, 1978: 288). Today, it is increasingly accepted that those diversities in ways of speaking and interacting are not superficial at all and that they can be largely accounted for in terms of different cultural attitudes and values; and the "cultural relativity in the field of interaction" is increasingly seen as a reality and an important subject for investigation.

In 1983 this author presented, at a meeting of the Sydney Linguistic Circle, a paper entitled 'Different cultures, different languages, different speech acts: English vs. Polish' (Wierzbicka, 1985), which argued that the supposedly universal maxims and principles of politeness were in fact rooted in Anglo culture and which in time became the nucleus of her book *Cross-cultural Pragmatics* (Wierzbicka, 1991/2003). The paper argued, in particular, that the "freedom from imposition," which Brown and Levinson (1978: 66) saw as one of the most important guiding principles of human interaction, was in fact an Anglo cultural value, and that the avoidance of "flat imperative sentences," which Searle among many others attributed to the "ordinary conversational requirements of politeness," did not reflect "universal principles of politeness" but rather, expressed special concerns of modern Anglo culture. At the same time, some

other linguists, too, were raising their voices against the 'universals of politeness' approach to pragmatics and were arguing in defense of culture as a key factor determining ways of speaking, trying to link the language-specific ways of speaking with different cultural values. The scholars who in the inhospitable post-Gricean climate of the 1980s (or so) were opposing a facile universalism and pioneering intercultural (as against pancultural) pragmatics, included, among others, Ho-min Sohn, the author of "Intercultural communication and cognitive values" (1983); Tamar Katriel, the author of *Talking straight: Dugri speech in Israeli Sabra culture* (1986); Yoshiko Matsumoto, the author of 'Reexamination of the universality of face: politeness phenomena in Japanese' (1988); James Matisoff, the author of *Blessings, curses, hopes, and fears: psycho-ostensive expressions in Yiddish* (1979); Thomas Kochman, the author of *Black and white styles in conflict* (1981); and Sachiko Ide, the author of a study on the Japanese value of *wakimae* or 'discernment' (1989). In the 1990s, the broadly-based intercultural pragmatics grew further, bearing rich fruit in the works of authors such as Donal Carbaugh, the author of *Talking American* (1988); Cliff Goddard, the author of papers such as 'Cultural values and 'cultural scripts' of Malay' and 'Communicative style and cultural values – Cultural scripts of Malay' (1997, 2000); Jean Harkins, the author of *Bridging two worlds: Aboriginal English and cross-cultural understanding* (1994); Felix Ameka, the author of studies on Ghanaian conversational routines and the editor of a special issue of the *Journal of Pragmatics* on interjections (1992); Michael Clyne, the author of *Intercultural communication at work: Cultural values in discourse* (1994), and many others. Last but not least, an important role was played by two open-minded and cross-culturally alive journals: Jacob Mey's *Journal of Pragmatics* and Marcelo Dascal's *Pragmatics and Cognition*.

Outside linguistics, there were anthropologists who did not give in to the superficial and anti-cultural universalism of the time and who continued to focus on the language particulars and to probe the links between ways of speaking, ways of thinking, ways of feeling and ways of living. To mention just a few names and works, particularly important from a linguistic point of view: Catherine Lutz, the author of the classic book *Unnatural emotions: Everyday sentiments on a Micronesian atoll and their challenge to Western theory* (1988); Richard Shweder, the founder of cultural psychology and the author of *Thinking through cultures – Expeditions in cultural psychology* (1991); Dorothy Holland and Naomi Quinn, the editors of *Cultural models in language and thought* (1987); Roy D'Andrade and Claudia

Strauss, the authors of *Human motives and cultural models* (1992), and Claudia Strauss and Naomi Quinn (1997), the authors of *A cognitive theory of cultural meaning*. Here, too, two journals played an important role: *Ethos* and *Culture and Psychology*.

There were also some philosophers who started to question the universalist pragmatic theories of Grice, Griceans, and neo-Griceans from a philosophical as well as cross-linguistic point of view. In particular, Wayne Davis (1998) argued in a book-length critique that “the Gricean theory has been barren” and that “the illusion of understanding provided by the Gricean theory has only served to stifle inquiry” (Davis, 1998: 3). “The Gricean explanation of common implicatures” is, Davis argued, “undermined by the existence of nonuniversal implicature conventions” (Davis, 1998: 183). For example, Grice and his followers had claimed that the correct interpretation of a tautology like *War is war* could be calculated from some universal maxims of conversation. Davis pointed out that this claim is refuted by the observation that such tautologies receive different interpretations in different cultures, and he concluded: “The moral is clear. Generalized tautology implicatures (...) are not explained by Gricean Maxims” (Davis, 1998: 46). In a similar context, Davis (1998: 168) quoted and endorsed the present author’s own observation that “from the outset, studies in speech acts have suffered from an astonishing ethnocentrism” (Wierzbicka, 1985: 145).

Many of the criticisms I present have been known for some time. But the import and seriousness of the defects individually and collectively have not been widely appreciated, and the problems have had little impact on the general acceptance of Gricean theory. The best known critics of the Gricean theory have either expressed confidence that solutions would be found within the Gricean framework (...) or presented alternative theories with similar defects (Sperber and Wilson, 1986). (...) Only one author (Wierzbicka, 1987) has argued that the conception is fundamentally flawed. (Davis, 1998: 3)

From the historical, as well as theoretical, point of view, it is important to note that a powerful impulse for the rise of intercultural pragmatics in the last decade came from the growing field of studies focussed on cross-cultural (or intercultural) communication. When in her 1986 book *That’s not what I meant!* Deborah Tannen stated that “the future of the earth depends on cross-cultural communication,” she was expressing a perception which was growing, especially outside academic circles, but also increasingly within. At a time when every year millions of people crossed the borders, not only between countries but also between languages, and when more and more people of many different

cultural backgrounds had to live together in modern multiethnic and multicultural societies, it was becoming increasingly evident to many scholars that research into differences between cultural norms associated with different languages was essential for peaceful co-existence, mutual tolerance, necessary understanding in the workplace and in other walks of life in the increasingly global and yet in many places increasingly diversified world. It was more and more frequently noted that the once popular assumption that the principles of politeness were essentially the same everywhere and could be described in terms of universal maxims such as those listed in Leech’s *Principles of Pragmatics* (1983) flew in the face of reality as experienced by millions of ordinary people – refugees, immigrants, the children of immigrants, caught between their parents and the society at large, cross-cultural families and their children, and also by monolingual stay-at-homes who suddenly found themselves living in societies that were ethnically, culturally and linguistically diverse.

The tremendous practical importance of identifying, and describing, the culture-specific norms of politeness and, more generally, norms of interpersonal interaction has been increasingly recognized in the field of language teaching. In this field, too, the realization grew steadily over the last decade or so that ‘Grice’s Razor,’ which extolled the economical virtues of concentrating on the supposed universality of the underlying principles and which cut off unnecessary culture-specific explanations, spelled out a disaster for the students’ communicative competence and their ability to survive socially in the milieu of their other language. As Kramsch (1993: 8–9) put it in her book *Context and culture in language teaching*, “If (...) language is seen as social practice, culture becomes the very core of language teaching. Cultural awareness must then be viewed both as enabling language proficiency and as being the outcome of reflection on language proficiency. (...) Once we recognize that language use is indissociable from the creation and transmission of culture, we have to deal with a variety of cultures.”

The present writer’s long polemics against the ‘universals of politeness’ and ‘universal principles of human conversation’ was rooted in her own experience as a language migrant (to use a term introduced by Besemeres, 2002) – from Polish into English, especially academic English, and also, into Australian English (Wierzbicka, 1997). On a very small scale, her 1997 cross-cultural memoir illustrates a noteworthy aspect of intercultural pragmatics as it has evolved over the last decade or so: the new alliance between, on the one hand, linguistic pragmatics, based on ‘hard’ linguistic evidence and rigorous

linguistic analysis, and, on the other, the growing field of study focused on the 'soft' data of personal experience of cross-cultural and cross-linguistic living.

I will illustrate this alliance with three excerpts from that memoir, which deliberately takes a personal rather than objective perspective. As many recent writers on the subject have argued, such a personal perspective legitimizes the insistence with which proponents of intercultural pragmatics have been challenging, in the last decade or so, the earlier paradigms. Commenting on her life in Australia, to which she emigrated from Poland in 1972 (having married an Australian), the author wrote:

I had to start learning new "cultural scripts" to live by, and in the process I became aware of the old "cultural scripts" which had governed my life hitherto. I also became aware, in the process, of the reality of "cultural scripts" and their importance to the way one lives one's life, to the image one projects, and even to one's personal identity.

For example, when I was talking on the phone, from Australia, to my mother in Poland (15,000 km away), with my voice loud and excited, carrying much further than is customary in an Anglo conversation, my husband would signal to me: 'Don't shout!' For a long time, this perplexed and confused me: to me, this 'shouting' and this 'excitement' was an inherent part of my personality. Gradually, I came to realise that this very personality was in part culturally constituted. (Wierzbicka, 1997: 119)

The realization of the close links between one's ways of speaking, one's personality and one's cultural background raised for the author the question that countless other immigrants are constantly confronted with: to what extent was it desirable, or necessary, to adapt to one's new cultural context (changing oneself in the process)?

Early in our life together, my husband objected to my too frequent – in his view – use of the expression *of course*. At first, this puzzled me, but eventually it dawned on me that using *of course* as broadly as its Polish counterpart *oczywiście* is normally used would imply that the interlocutor has overlooked something obvious. In the Polish 'confrontational' style of interaction such an implication is perfectly acceptable, and it is fully consistent with the use of such conversational particles such as, for example, *przecież* ('but obviously – can't you see?'). In mainstream Anglo culture, however, there is much more emphasis on 'tact', on avoiding direct clashes, and there are hardly any confrontational particles comparable with those mentioned above. *Of course* does exist, but even *of course* tends to be used more in agreement than in disagreement (e.g. 'Could you do X for me?' – 'Of course'). Years later, my bilingual daughter Mary told me that the Polish conversational expression *ależ oczywiście*: 'but-EMPHATIC of course' (which I would often replicate in English as 'but of course') struck her as

especially 'foreign' from an Anglo cultural point of view; and my close friend and collaborator Cliff Goddard pointed out, tongue in cheek, that my most common way of addressing him (in English) was 'But Cliff. ...'. (Wierzbicka, 1997: 119)

Thus, the author had to learn to avoid overusing not only "of course" but also many other expressions dictated by her Polish cultural scripts; and in her working life at an Anglo university, this restraint proved invaluable, indeed essential.

I had to learn to 'calm down', to become less 'sharp' and less 'blunt', less 'excitable', less 'extreme' in my judgements, more 'tactful' in their expression. I had to learn the use of Anglo understatement (instead of more hyperbolic and more emphatic Polish ways of speaking). I had to avoid sounding 'dogmatic', 'argumentative', 'emotional'. (There were lapses, of course.) Like the Polish-American writer Eva Hoffman (1989), I had to learn the use of English expressions such as 'on the one hand. . ., on the other hand', 'well yes', 'well no', or 'that's true, but on the other hand'.

Thus, I was learning new ways of speaking, new patterns of communication, new modes of social interaction. I was learning the Anglo rules of turn-taking ('let me finish!', 'I haven't finished yet!'). I was learning not to use the imperative ('Do X!') in my daily interaction with people and to replace it with a broad range of interrogative devices ('Would you do X?' 'Could you do X?' 'Would you mind doing X?' 'How about doing X?' 'Why don't you do X?' 'Why not do X?', and so on). (Wierzbicka, 1997: 119–120)

As these quotes make clear, for writers whose view of intercultural pragmatics was informed by their own personal experience, their knowledge of what was involved was not purely theoretical: above all, it was practical. They were convinced that the insistence on cultural differences was not only theoretically justified (because these differences were real) but also that acknowledging them, and above all, describing them, was vitally important for the practical purposes of intercultural communication and understanding; and in the case of immigrants, of daily living.

The 1991 edition of Wierzbicka's *Cross-cultural pragmatics* was an attempt to challenge the Gricean and Brown and Levinsonian paradigms, and to expose the anglocentric character of various supposedly universal maxims, principles and concepts (including the key concept of 'face,' which was the linchpin of Brown and Levinson's theory of politeness). Twelve years later, when the expanded second edition of the book was published, the tide had changed. Nonetheless, paradoxically, while the universalist pragmatic frameworks developed in the 1970s were gradually losing their appeal, the program of actually

describing the different ways of speaking and thinking linked with different cultures continued to encounter a great deal of resistance.

As the differences between cultures and subcultures were increasingly celebrated, there was also a growing suspicion of any generalizations as to what exactly these differences might be. Diversity was seen as beautiful but also as inherently elusive and indescribable. With the growing emphasis on diversity, the view gradually developed that diversity was everywhere, and that while those differences could and should be celebrated, they could not be described. Thus, in many quarters, there developed a great fear of the notion of culture (especially, a culture), and attempts to identify any differences between particular cultures came to be seen as static culturologies.

Those who promote intercultural pragmatics accept, of course, that cultures are not essences, that cultures are not monads, and that cultures have no fixed contours. But they refuse to conclude from this that cultures cannot be discussed, described, and compared at all. They point out that it would also be a conclusion denying the subjective experience of immigrants, and one going against their vital interests; and that to deny the validity of the notion of culture-specific discourse patterns (including Anglo discourse patterns) is to place the values of political correctness above the interests of socially disadvantaged individuals and groups. In particular, they argue that with the increasing domination of English in the world, both Anglos and non-Anglos need to learn about various Anglo cultural scripts, and that to try to describe these scripts, and to explain the values reflected in them, is not to indulge in stereotyping, but on the contrary, it is to help Anglos to overcome their inclination to stereotype immigrants as rude, while at the same time helping immigrants to better fit in, socially, and to improve their lives (cf., e.g., Wierzbicka, 2002a, 2002b).

In this context, it has become more and more clear that the key issue is that of the metalanguage in which different speech practices and norms can be usefully described and compared. At a time when the English language was commonly taken as a baseline for all comparisons, even those pragmaticists who were more interested in cross-linguistic variation than in supposed universals of politeness or a supposedly universal logic of conversation often assumed that English lexical categories provided legitimate analytical tools for such comparisons. In particular, it was widely assumed that English words such as 'request,' 'apology,' and 'compliment' could be relied on as such tools, and that one could study how requests, apologies, compliments and so on are realized in this or that language and culture (cf., e.g., Blum-Kulka

et al., 1989). The fact that many other languages do not have words corresponding in meaning to such English categories was either ignored or dismissed as unimportant.

Similarly, English folk-categories such as directness, formality, harmony or politeness were accepted uncritically as valid tools for intercultural pragmatics, as were also lexical categories of technical English such as 'face' (Brown and Levinson, 1978), 'relevance' (Sperber and Wilson, 1986) and so on. As discussed, for example, in Goddard (2004: 144), the ethnocentrism "inherent in choosing a descriptive metalanguage which is language-specific and culture-specific (...) necessarily imposes an 'outsider perspective'" on the language and culture described in such terms. At the same time, the alternative practice of using indigenous terms (e.g. *enryo*, *wa*, *omoiyari* in the case of Japanese) involved obvious translation problems in reverse.

The approach to intercultural pragmatics advocated and implemented in the so-called NSM approach seeks to solve the crucial problems of a suitable metalanguage for intercultural pragmatics by pointing to the existence of a shared lexical and grammatical core in all languages – a core which can be used as a culture-neutral and language-independent natural semantic meta-language (hence the term "NSM"). This approach has now identified, on an empirical basis, 60 or so universal semantic primes, whose English exponents are linked with simple words such as 'good' and 'bad,' 'someone' and 'something,' 'people,' or 'know,' 'think,' and 'want.' (For exponents in languages other than English, see Goddard and Wierzbicka (eds.), 2002). Relying on this empirically established set of primes, the proponents of the NSM approach to intercultural pragmatics have produced a large body of detailed, highly specific descriptions of culture-specific norms and practices, formulated neither in technical or semitechnical English terms such as 'formal' and 'informal' or 'direct' and 'indirect,' nor in terms of English folk categories such as 'apology,' 'compliment,' 'sarcasm,' 'understatement' and so on, but rather, in terms of simple words which have equivalents in all languages.

The identification of universal semantic primes that have lexical exponents in all languages has allowed NSM researchers to develop a theory of cultural scripts, where a cultural script is a hypothesis about culture-specific attitudes, assumptions and norms formulated in simple words and testable in consultation with native speakers and cultural insiders. This theory has now produced a large body of fine-grained culture-specific descriptors and cross-cultural comparisons. (See, e.g., Goddard 1997,

2000, 2004; Goddard and Wierzbicka (eds.), 2004, in press; Wierzbicka, 1991/2003, 1996, 2002b.)

The proponents of the cultural scripts approach to intercultural pragmatics argue that the use of such concepts can free researchers from what Goddard (2004) calls “terminological ethnocentrism” and give them a neutral, culture-independent metalanguage for describing different cultural norms. At the same time, the use of such concepts allows them to capture the native speaker’s point of view, without distorting it through the application of descriptive tools rooted in the English language or Anglo academic culture.

On this point, the NSM-based approach to cross-cultural pragmatics differs radically from that characteristic of works like Blum-Kulka *et al.*’s (1989) *Cross-cultural pragmatics: Requests and apologies* or Kasper (and the subsequent work by Blum-Kulka and her colleagues). The proponents of the NSM approach argue that while the works in this tradition must be appreciated for their attention to cultural differences reflected in ways of speaking, they cannot escape the charge of terminological, and not only terminological, ethnocentrism. Given that words such as ‘requests’ and ‘apologies’ stand for conceptual artifacts of the English language, using them as analytical tools inevitably involves imposing an Anglo perspective on other languages and cultures. To describe ways of speaking across languages and cultures in terms of folk categories encoded in English is like describing English talk in terms of Japanese, Hebrew or Russian folk categories (e.g., the Japanese *wakimae*, cf. Ide, 1989, the Hebrew *dugri*, cf. Katriel, 1986, or the Russian *vran’e*, cf. Wierzbicka, 2002b); but of course nobody would wish to describe English in such terms.

As the present author (cf., e.g., Wierzbicka, 1991/2003) and colleagues have repeatedly argued, the conviction shared by so many semanticists and pragmaticists that it is all right to try to describe all languages through English terms untranslatable into the language of speakers whose ways of thinking those terms are supposed to explain and illuminate, shows the same Anglocentrism that the Gricean and post-Gricean maxims, principles, and conversational postulates once did. Such an anglocentrism is sometimes defended in the name of science. For example, Kay and Berlin in various publications defend the use of English words such as ‘color’ to analyze thought processes of speakers of languages that have no word like ‘color’ in the name of scientific discourse. Their opponents (including the present author) argue that English has no special status in describing the ways of thinking of speakers of

languages other than English. Words such as ‘good’ and ‘bad’ or ‘say,’ ‘think,’ ‘know’ and ‘want,’ which, as evidence suggests, have morpholexical exponents in all languages, free the analysts from an Anglo perspective, while allowing them at the same time to retain a mini-lexicon of 60 or so English words as a practical lingua franca for articulating different culture-specific conventions, norms and values (and more generally, ways of thinking). For example, claims that in many societies people are guided in their ways of speaking by principles such as ‘don’t impose’ or ‘be relevant’ depend on the English words ‘impose’ and ‘relevant,’ which have no equivalents in other languages. To say that speakers of those other languages are deeply concerned about some values which – as it happens – can only be formulated in English means to give English a privileged position in the humankind’s mental world.

The theory of cultural scripts seeks to formulate norms, values and principles of language use in words which, unlike ‘impose’ or ‘relevant,’ have equivalents in all other languages, that is words that, it is argued, stand for universal human concepts. These universal words (or word-like elements) are the same words in which semantically encoded meanings are also explicated.

For other current approaches to intercultural pragmatics, see, in particular, the first issue (2004, 1) of the new journal *Intercultural Pragmatics*.

Internet and Language Education

History of the Internet

Computer power is 8000 times less expensive than it was 30 years ago. If we had similar progress in automotive technology today, you could buy a Lexus for about \$2. It would travel at the speed of sound and go about 600 miles on a thimble of gas (Wagschall, 1998).

In the space of scarcely a decade of widespread availability, the Internet has affected and even transformed many aspects of people's lives in the technologized world. To be sure, the basic structure of the Internet has existed since the 1960s, but it was not

until the 1990s that it began to be used extensively by the general population, and not until the mid-1990s that schools started to use it for educational purposes (Keating and Hargitai, 1999).

Sometime around the early to mid-1990s was also the time that most educators started to receive e-mail service, either privately or through their institutions. The precise dates and degrees of availability vary widely from country to country and institution to institution, with countries such as Finland and the United States being early leaders, and universities and colleges having earlier and easier access than elementary or secondary schools. Most (if not all) educators have access to e-mail and to the Internet in industrialized countries, but also increasingly in the developing countries (see Warschauer, 2003). However, the degree, quality, and/or frequency of access still varies widely.

The Internet as Classroom

The Internet has made it possible for institutions to offer courses and entire degree programs online, so that in the words of enthusiasts, the 'two-by-four-by-six' constraints of classroom instruction have been broken. This phrase, first used by Tiffin and Rajasingham (1995: 87), reverberated around the online learning conferences of the late 1990s to indicate how the Internet had managed to supersede the *two* covers of the textbook, the *four* walls of the classroom, and the *six* daily hours of (high school) instruction.

The first years of the Internet boom led to enthusiastic activity in setting up online classes, courses, and programs. A large number of universities started planning to offer online or distance degree programs. In their 1997 guide to external degrees, Spille *et al.* (1997) listed 122 accredited universities in the United States that offered distance degrees.

In addition, several large consortia or 'virtual universities' sprang up in the United States, the three largest being California Virtual University (CVU), Western Governors University (WGU), and Southern Regional Electronic Campus (SREC). These were originally not universities offering actual courses or degrees, but they acted as brokerage institutions, with online catalogues, searchable databases, and multiple enrollment options. All had plans to establish corporate links and to offer information on corporate training providers. CVU was discontinued in 1999. WGU is now an accredited university and offers degrees in education, business, and information technology. However, its degrees are not universally recognized. SREC has now evolved into the SREB (Southern Regional Education Board) 'electronic campus,' in which a large number of southern colleges and universities in 15 states participate. Courses offered include some foreign language courses (about 30), but many of these are taught by videotape or audiotape, and are thus not truly online, i.e., Internet-based.

Other countries also have their online institutions or consortia, e.g., the Canadian Virtual University (CVU – not to be confused with the now-defunct California version) offers a rather extensive menu of foreign language courses. Similar to their U.S. counterparts, many of these are textbook plus video/audio-based, but some offer supplementary materials on the Internet. Other international institutions include the Erasmus Student Network in Europe, aimed at facilitating exchange programs and study abroad, CIEE (Council on International Educational Exchange), and many others.

When one looks at the actual mechanisms and materials that are used to offer 'online' language

classes, one often finds that they operate with a traditional textbook, supplemented perhaps with a CD-ROM, video and/or audiotapes (all these purchased by the student, and sent by regular mail), with at times an online component. In other words, most 'online' courses are only in part online (and often minimally, or optionally). Thus, many courses are a mixture of traditional distance education practices (distributing materials by mail) and additional Internet and e-mail services. This may gradually shift toward more fully online technologies, as course management systems (CMS) become better (and more affordable) and as Internet technologies, such as voice over IP and streaming audio and video become more accessible.

Accessibility continues to be an important issue. While it is possible in most places now to get Internet access (if only in Internet Cafes, where an hour's access may be quite cheap by Western standards), in many countries access at home may be expensive, because even local calls may be charged per minute. Thus, a group of students in the United States communicating with a group of students in say, Japan, may encounter inequalities of access, not because of differences in equipment, but because of the cost of telephone bills. Massive expansion of broadband access (cable, DSL, etc.) will equalize access in many areas. However, there will remain vast areas of the globe, and numerous neighborhoods in even the most well-connected countries, where access continues to be difficult.

Online courses and programs receive mixed reviews. As mentioned above, initial enthusiasm was considerable, even though detractors have been equally vociferous. A scathing indictment was David Noble's *Digital diploma mills* (1998), which cited numerous ways in which online programs may shortchange students, cut corners, reduce the quality of education, and commercialize and commodify knowledge as merchandise bought and sold over the Internet.

The advantages and disadvantages of online learning are fairly predictable. Among the advantages are individualization, flexibility, and independence from time and space constraints (i.e., study when you want, where you want). Disadvantages include the lack of face-to-face interaction, technical problems, and dependence on self-motivation. Interestingly, instructor-student interaction, which one would expect to be less in online classes, is often reported to be in fact the opposite: students and instructors often report that they have in fact more and better interaction online than they would in the equivalent classroom setting (e.g., large undergraduate or high school classes,

where individual attention is minimal). A final logistical problem of online courses can be the administration of official tests and exams at a distance (e.g., how to prevent cheating and how to arrange for proctoring).

A crucial requirement (perhaps *the* most crucial requirement) of a successful online course or program is the development of a (virtual) community of learning, a social context. An online 'space' must be created that fosters a sense of belonging and that encourages (and requires) learners to communicate with one another. Simple steps along the way may be for all learners to post personal bios and photographs, the use of chat rooms where learners can get to know each other (in small groups) informally, and the design of collaborative activities and projects. Several online environments have been designed that encourage the development of such communities (e.g., Svensson, 2003), and clearly such three-dimensional, highly visual, and multi-modal virtual landscapes can be attractive for certain groups of students. As mentioned above, CMS are constantly becoming more versatile, integrating graphics, audio, video, animation, interactive games and quizzes, and more. Of course, the need for such bells and whistles varies with the type of student: Some will always prefer a more no-nonsense information and debate-based approach driven by professional goals and requirements.

Research and Resources: The Internet as Tool

In language courses we rely on textbooks, dictionaries, and libraries; on exposure to the target language from a variety of sources; and of course on interaction with fellow students, teachers, and if possible other target-language speakers. What can the Internet offer to assist learners in their quest for language sources, resources, and guidance?

The Internet can serve as a useful tool for language learners, either in full online classes, or as supplements to regular classes (in so-called *hybrid* formats, which combine classes with online work) in these three ways: (1) information about languages and linguistics; (2) authentic language use and language samples; (3) opportunities for interaction. A fourth way, practice opportunities, will be discussed after these three, in the next section.

Information about Languages and Linguistics

Let's say you want to check the vowel chart of Quechua. Before the mid-1990s, you would try to find a source on your shelves or in the library, or perhaps order books via Interlibrary Loan, and so on. Now you type the words *Quechua vowel chart* into one of

the major search engines, and within a few seconds you are looking at the vowel chart (the accuracy being dependent upon the original source).

To give another example, perhaps you are citing a research paper, but you are missing a particular detail such as a page number or the author's initials. Instead of searching in libraries or hunting through your files to find the original or your notes, you now might find the information through an Internet search in a fraction of the time and effort: someone, somewhere will probably have a reading list posted that has the information you need.

As these examples show, the researcher, student, and teacher of language can find an enormous amount of information about language and languages on the Internet, although the quality of that information will have to be evaluated on a case-by-case basis. A number of websites and portals, such as Ethnologue, the Yamada Language Center, Bob Peckham's Famous French Links, the AATG links for German, among many others (see 'Relevant Websites'), attempt to guide the visitor to particular categories of information and services (such as specialized language fonts) and in some cases evaluate or comment on the sites listed. In addition, there are a number of online journals on CALL (Computer-Assisted Language Learning), many of them free of charge.

In sum, the student of linguistics and of any particular language can find an abundance of information on the Internet. Language teachers can use the Internet to design research projects for their students, as well as to incorporate authentic texts (including audio and video) in class. As Internet technology advances, it becomes easier to obtain on-the-spot transcripts of video fragments, to find ready-made lesson notes for news clips, or to compile a list of online activities in grammar, vocabulary, and so on.

Authentic Language Use and Language Samples

Most language teachers and students agree that using authentic materials is beneficial for a number of reasons, especially if this can be accompanied by carefully designed activities and lesson plans. Finding suitable authentic materials can be quite difficult and time-consuming, of course, and here the Internet once again has a plethora of resources available. In some cases, teaching materials such as transcripts and prototype activities (as mentioned above) are made available on websites, but in most cases the teacher or student must decide how to evaluate, interpret, and deal with the materials found. Once again, as in examples mentioned above, the quality, veracity, or representativeness of the authentic language samples must be evaluated by the user.

A host of other potential issues may affect the use of authentic language samples from the Internet. Let's say a teacher of Chinese wants to use a video clip from a news broadcast in Chinese in tomorrow's lesson. This video clip may be available now on a news website, but there is no guarantee that it will still be there tomorrow. Furthermore, relying in class on accessing a live website has its risks: the site may be down, the local server may be down or suddenly slow down to a crawl, and so on. Therefore, the teacher may have to download the clip to the hard drive, but perhaps this is not allowed because of copyright restrictions, or space restrictions, or special software may be required. To use the resources available on the Internet at short notice, a number of prerequisites may apply. It is neither automatic nor risk-free.

A different, but no less thorny issue relating to the abundance of authentic materials available on the Internet in written form is the ease of cutting and pasting material into essays and writing projects. The ease of access to quotes and academic sources makes unattributed use of quotes easy. As in other areas, however, the Internet offers some solutions to the problems it has itself created: there are a number of excellent websites and services available to not only spot plagiarisms but also to discuss ways of preventing and dealing with it in foreign language writing classes.

Opportunities for Interaction

As mentioned earlier, by the mid-1990s, most academic institutions had begun providing e-mail access for faculty, staff, and students. In addition, increasing numbers of people began to have e-mail access from their home, first by modem, then by cable, DSL, or other broadband connections. In some countries adult access to e-mail is as high as 90% (for example, in the United Kingdom, Australia, and The Netherlands, according to a 2002 Nielsen Ratings survey). Chat and instant messaging (IM) are less ubiquitous, yet in some countries (e.g., Brazil and Spain) more than 40% of adults were reported to use it. In addition, young adults in the United States now report that they hardly use e-mail anymore (except to communicate with parents and teachers Thorne, 2003); but use IM most of the time that they are online (which can literally be 24 hours a day in the United States where there are generally no time limits). Many young people routinely have several windows open in which they communicate with several friends separately and simultaneously, while also listening to music and claiming to be doing their homework. If this is true, and if the homework indeed

gets done satisfactorily, then the Internet has truly brought multitasking to the younger generations, too.

The effect of various forms of online interaction in language learning have not yet been fully investigated, although a number of studies have been conducted. Lamy and Goodfellow (1999) compared asynchronous (e-mail or discussion list) and synchronous (chat) communication in an online French class, and they found that asynchronous communication was particularly well suited for language learning, because it allows for a combination of reflective and conversation-like language use. Thorne (2003) found that students required to participate in asynchronous online learning were relatively unmotivated until they discovered IM connections with their counterparts abroad; through IM they started getting to know them, and this also involved flirtatious and romantic encounters online. What it really means for online language learning remains unclear at this point. The slower, more monitored medium of e-mail and threaded discussion allows the learner to focus more on accurate and edited language use (Lamy and Goodfellow, 1999), whereas the more spontaneous medium of IM is generally quite tolerant of errors, but places a high premium on effective communication of interpersonal meanings. It will clearly take significant longitudinal research efforts to establish the learning potential of the various modes of Internet interaction.

Activities: The Internet as Tutor

Ever since the Internet became popular for language learning in the mid-1990s, enterprising teachers have been putting up language activities, quizzes, and games. During the first few years, most online activities were actually a step back (pedagogically speaking) from the sorts of things teachers had been doing with actual software (such as Hypercard) since the 1980s. Online activities tended to be fairly mechanical, often based on blank-filling or multiple choice, with little meaningful feedback. The design challenges were considerable, but the technologies were not versatile and only minimally interactive. New web design technologies and advances in speed of access, audio and video compression, and more powerful web browsers have resulted in a greater variety of online language practice opportunities. These now include listening comprehension based on audio and video clips, animated writing tutorials for Japanese and Chinese, drag-and-drop vocabulary and phrase matching, and many others. In addition, feedback may be individually tailored, so that the level of the activity is adjusted in accordance with

the responses of the student (e.g., Jim Cummins's 'e-lective' reading program).

In addition to activities designed for individual practice, the Internet also offers opportunities for collaborative work. Examples include the following:

- *WebQuests* – inquiry-oriented group projects (designed by Bernie Dodge of San Diego State University) that use Internet resources to investigate particular topics. Free websites exist (especially Dodge's original WebQuest page at SDSU) that facilitate the design of such projects as well as the sharing of results, e.g., in the form of final presentations.
- *Concordancing* – A concordance program searches texts or corpora of texts for certain words, word combinations, or phrases in context, making it an ideal tool for collaborative investigations of vocabulary, grammar, or idiom usage. Sample concordance and corpus websites exist for a number of languages; in addition, the major search engines can also be used as concordancers of sorts: Typing in a particular word or string will bring up many examples of the particular items in question, which can then be investigated by students in groups and reported on. A large set of links and resources, as well as pedagogical advice, can be found on the website of Michael Barlow.
- *Project Poster* – A nonprofit web-based service that allows students and classes to quickly put together some text and images in the form of a simple website that can then be used for class presentations.

There are many other resources available on the Internet that can be used for students working in groups to engage in project-based learning. As one further example, the University of Iowa has an excellent website for phonology and pronunciation in English and Spanish, with animated diagrams and video clips of articulation. Language learners can use this website (and many others on a variety of language topics) to investigate, discuss, and practice aspects of pronunciation.

Equality, Democracy, and the Internet

In various places above I have alluded to certain inequalities in access to and the use of technology in education. Such inequalities have generally been referred to as the "digital divide" (Warschauer, 2003). In the early days of technology use in education, there was a clear division between the traditional haves and have-nots in society in terms of hardware, software, and access. Thus, in the United States, affluent suburban schools were the first ones to get computers and Internet access, whereas inner city and rural

schools were left behind. There was a fear that poor schools and minorities would once again miss out on equal opportunities for learning with the new technologies. As a result, a strong push was made in the United States to ensure that the digital divide would be bridged. Special programs were set up to provide disadvantaged schools and areas with heavily discounted computers and connections. One such program, initiated during the Clinton-Gore administration, is E-Rate, which provides broadband connections and equipment to underserved districts and schools at discounts of up to 90%. In addition, many grant proposal requests encourage (or require) the inclusion of technology in educational project proposals, thus allowing grant recipients to beef up the technological infrastructure of their institutions.

In the early years the Internet was heavily English-dominated. It was hard to find websites in other languages, and in fact the technologies to use scripts other than Roman (non-alphabetic, or so called 'double-byte' scripts such as Japanese and Korean, or right-to-left scripts such as Arabic and Hebrew) were primitive. But a common standard, Unicode, has become widespread, and this technology enables the encoding of any writing system. A related issue has been the worry that the English-dominated Internet would contribute to the increasing marginalization (and extinction) of minority languages. However, as Warschauer shows, the variety of websites in languages other than English has increased significantly. In 1997, 81% of websites were written in English, but in 2000 this percentage had dropped to 68% (Warschauer, 2003: 96). In addition, many websites are bilingual or multilingual, and online translation tools, such as Babel-fish, exist that can automatically translate a website into another language (imperfectly, but in most cases comprehensibly).

According to *Technology Counts* (2004), availability of computers and access to the Internet are now much improved in the United States, with just a few percentage points separating richer and poorer schools in terms of number of students per computer, and number of classrooms connected to the Internet.

Internationally, there are still vast discrepancies from country to country as well as from region to region within countries (this summary is based on data in *Technology Counts*, 2004). In Europe, Finland, Sweden, and Austria are among the leaders in school computer use, whereas France, Germany, and Italy have less access and connectivity. In Africa, many countries have few computers in schools, with South Africa and Egypt standing out as having respectively about 17.5% and 31% of schools equipped with computers. Asian countries also vary greatly

in terms of access. Both South Korea and Japan have made enormous efforts to get computers into every classroom. Poorer countries such as Mongolia, Vietnam, and Laos are much farther behind. A similar situation pertains in Latin America, with Chile ahead of all other countries, and the poorer countries such as Bolivia, Ecuador, Peru (as well as most Central American countries) lagging far behind.

However, these numbers, interesting though they may be, do not tell the whole story. Number of students per computer or number of classrooms connected to the Internet tells us little or nothing about the quality of their use in education. It goes without saying that technology can be used well or badly, efficiently or wastefully, productively or destructively, innovatively or mind-numbingly. And from this perspective, comparing the amount or even sophistication of technology across places and schools is of limited interest. Much more important is a comparison of what is done with the technology, and here reliable data are extremely hard to come by. Yet, there are numerous reports of vast differences in the pedagogical aspects of technology use between rich (middle-class, suburban) schools and poor (rural, inner-city, high-immigrant) schools. In the former you tend to see more open-ended applications, web and graphic design programs, and students engaged in creative projects. In the latter, you tend to see students working on so-called 'integrated learning systems' or a variety of basically 'drill-and-kill' CD-ROM programs, essentially lock-step language practice without much imagination or creativity involved. In the former, you tend to see more group work in an open classroom setting, in the latter it is more likely to be individual work in a computer lab or in a corner of the classroom. Thus, the digital divide may be perpetuated even if inequalities of equipment and connectivity are overcome, because of the lack of training of teachers and students with the technology and its creative use and because of a lack of upgrading of the curriculum.

There are a number of things that need to be done to overcome this second, far more insidious educational inequality. The first is teacher education. It has often been recommended that at least one-third of a technology budget should be spent on teacher professional preparation and inservice development. This recommendation is rarely if ever followed in practice. In most cases, once the equipment and software, and the building and wiring of labs are paid for, little money (if any) is left over for teacher training. The few workshops available (often offered by vendors) tend to be shallow and cursory, technology-oriented rather than pedagogy-oriented, and scarcely address the integration of technology into a meaningful and challenging curriculum. Even in CALL

conferences, a majority of presentations focus on new technologies and innovations, rather than on solid classroom practices.

Now that many countries (India, South Africa, Brazil, South Korea, Japan, and so on) are engaged in a major push to make computers available in every classroom, early signs are once again that the issue of integrating technology into the curriculum is largely ignored or at best neglected. Unless a consistent policy is established of putting teacher training and curriculum development *before* computer purchasing and infrastructure (in budgeting terms), these countries will find that, to quote Larry Cuban's conclusion from surveys in the famed Silicon Valley, computers are "oversold and underused" (not to say, "misused," too). The following quote from Phil Agre expresses the dilemma well:

It is extraordinarily common for organizations to invest large sums in complex computers without any investment in training. Schools often invest their scarce resources in computers without any thought to the curriculum. In some cases, the responsible authorities are duped by claims that the systems are easy to use. In other cases, it is assumed that computers will pay for themselves by displacing staff, and therefore further investments in human capital seem like the opposite of that intention. In each case, what is neglected is what Kling (1992) calls the web of relationships around the computer. Computers are easy to see, but webs are not. (Agre, 1999)

Unless the issues of teacher preparation and curriculum development are addressed in an energetic fashion, inequalities in the innovative, equitable, and responsible use of technologies will persist regardless of how many work stations, applications, wires, or wireless networks schools are bombarded with.

Future

The future of technology in language education is like the opening paragraph of Dickens's *Tale of two cities*: "It was the best of times, it was the worst of times . . ." The trend can go in either direction, the crucial element being what is to come first: quality of pedagogy and curriculum or the latest, fastest, glitziest hardware, software, and connectivity? As an educator with a long-standing interest in technology, I can only sustain a belief in its beneficial effects if I think that it can improve the quality of the educational experience of our students. I can only defend this belief because I have kept this mantra firmly in mind over many years:

- Pedagogy first
- Curriculum second
- Computers third.

In the end, it is up to the teacher and the student to define the role of technology in learning. There are many exciting examples of good and creative work already available, and surely many more to come, especially if teachers and students demand them and actively participate in their development. At the same time, there are strong commercial and administrative forces that will always try to tug the development toward more mechanical, mass-produced, test-oriented functions. It is important to realize the dynamics of instruction both at the micro and the macro levels, so that effective action can be promoted.

Irony

S Attardo, Texas A&M University, Commerce, TX, USA

© 2006 Elsevier Ltd. All rights reserved.

The term 'irony' is commonly used to describe both a linguistic phenomenon (verbal irony) and other phenomena including 'situational' irony (i.e., irony of facts and things dissociated from their linguistic expression; Shelley, 2001) such as a fire-station burning to the ground, various more-or-less philosophical ideas (Socratic irony, Romantic irony, Postmodern irony), and even a type of religious experience

(Kierkegaard, 1966). While there may be connections between situational and verbal irony, it does not appear that literary and religious uses can be fruitfully explained in terms of linguistic irony. This treatment will be limited to verbal irony.

Other definitional problems include the purported distinction between irony and sarcasm. While some have argued that the two can be distinguished (for example, irony can be involuntary, while sarcasm cannot be so), others maintain that no clear boundary exists. A further problem is presented by the fact that in some varieties of English, the term *irony* is undergoing semantic change and is assuming the meaning

of an unpleasant surprise, while the semantic space previously occupied by *irony* is taken up by the term *sarcasm*.

The word *irony* goes back to the Greek *eironeia* (pretense, dissimulation) as does the history of its definition and analysis. Irony is seen as a trope (i.e., a figure of speech) in ancient rhetorics and this analysis has remained essentially unchallenged until recently. In the traditional definition irony is seen as saying something to mean the opposite of what is said. This definition is demonstrably incorrect, as a speaker may be ironical but not mean the opposite of what he/she says; cf. *It seems to be a little windy* (uttered in the middle of a violent storm), in which the speaker is saying less than what is meant. Similarly, overstatements and hyperbole may be ironical (Kreuz and Roberts, 1995).

A recent and fruitful restatement of the irony-as-trope theory has been presented by Paul Grice who sees irony as an implicature, i.e., as a deliberate flouting of one of the maxims of the principle of cooperation (see **Cooperative Principle**; Grice, Herbert Paul; **Implicature**). Relatedly, speech-act approaches to irony see it as an insincere speech act. Initially, Grice's approach saw irony as a violation of the maxim of quality (i.e., the statement of an untruth) but this claim has been refuted, as seen above. Broadening the definition to, for example, 'saying something while meaning something else,' runs the risk of obliterating the difference between irony and other forms of figurative or indirect speech. However, this loss of distinction may be a positive aspect of the definition, as has been recently argued (Kreuz, 2000, Attardo, 2002).

While the idea of 'oppositeness' in irony is problematic, approaches to irony as negation have been presented (Giora, 1995), who sees irony as 'indirect' (i.e., inexplicit; cf. Utsumi, 2000) negation; related ideas are that of contrast (Colston, 2002) and inappropriateness (Attardo, 2000).

A very influential approach to irony is the mention theory (Sperber and Wilson, 1981), which claims that an utterance is ironical if it is recognized as the echoic mention of another utterance by a more or less clearly identified other speaker (see **Use versus Mention**). Furthermore, the ironical statement must be critical of the echoed utterance (cf. Grice, 1989: 53–54). Similar theories based on the ideas of 'pretense' and 'reminder' have been presented as well. Criticism of the mention theory notes that not all irony seems to be interpretable as the echo of someone's words, or that if the definition of mention is allowed to encompass any possible mention it becomes vacuous (since any sentence is potentially the mention of another sentence). Furthermore, there exists an admittedly rarer, non-negative, praising irony, called *asteism*

(Fontanier, 1968: 150). An example of *asteism* might be a colleague describing Chomsky's *Aspects of the theory of syntax* as a 'moderately influential' book in linguistics. Other approaches to irony include the 'tinge' theory, which sees irony as blending the two meanings (the stated and the implied ones) with the effect of attenuating the ironical one (Colston, 1997).

All the theories of irony mentioned so far share the idea that the processing of irony is a two-step process in which one sense (usually assumed to be the literal meaning) of the utterance is accessed and then a second sense of the utterance is discovered (usually under contextual pressure). Thus, for example, in a Gricean account of irony as implicature, the hearer of an utterance such as *That was smart* (uttered as a description of clumsy behavior, such as spilling one's wine upon someone's clothing) will first process the utterance as meaning literally roughly 'This behavior was consonant with how smart people behave' and then will discard this interpretation in favor of the implicature that the speaker means that the behavior was *not* consonant with how smart people behave. This account has been challenged recently by 'direct access' theories.

The direct access theories claim that the hearer does not process the literal meaning of an ironical utterance first and only later accesses the figurative (ironical) meaning. Rather, they claim that the literal meaning is either not accessed at all or only later. Direct access interpretations of irony are squarely at odds with the traditional interpretation of irony as an implicature. Some results in psycholinguistics have been seen as supporting this view (Gibbs, 1994). The mention theory of irony was commonly interpreted as a direct access theory, but recent work (Yus, 2003) seems to indicate that it too can be interpreted as a two-step process. Other researchers (e.g., Dews and Winner, 1999) have presented contrasting views which support the two-step approach, although not always the claim that the literal meaning is processed first: claims that interpretations are accessed in order of saliency (Giora, 2003) or in parallel have been put forth.

Psycholinguistic studies of irony have focused on children's acquisition of irony (Winner, 1988), progressively lowering the age at which children understand irony to under ten years old; on the neurobiology of the processing of irony (McDonald, 2000), emphasizing the role of the right hemisphere alongside the left one (in which most language processing takes place); and on the order of activation of the various meanings in the ironical text. A significant issue is the degree and nature of the assumptions that the hearer and speaker must share for irony to be understood; this can be summed up as the 'theory of mind' that the speakers have.

In particular, irony involves metarepresentations (Bara *et al.*, 1997, Curc , 2000).

Considerable attention has been paid to the optional markers of irony, i.e., primarily intonational and kinesic indications of the speaker's ironical intent. While several phonological and other features have been considered 'markers' of irony, it appears that none of these features is exclusively a marker of irony. Reviews of markers include phonological (e.g., intonation), graphic (e.g., italics, punctuation), morphological (e.g., quotatives), kinesic (e.g., winking), and contextual clues (Haiman, 1998).

Recently, the social and situational context of irony as well as its pragmatic ends have begun being investigated in sociolinguistics and discourse/conversation analysis as well as in psycholinguistics. Work on the social functions of irony has found a broad range of functions, including in- and out-group definition, evaluation, aggression, politeness, verbal play, and many others (e.g., Clift, 1999; Anolli *et al.*, 2002; Gibbs and Colston, 2002; Kotthoff, 2003). It is likely that this list may be open-ended.

The relationship between irony and humor remains underexplored, despite their obvious connections, although some studies are beginning to address the interplay of irony and other forms of implicature, such as indirectness, and metaphoricality. Finally, it is worth noting that dialogic approaches to language (e.g., Ducrot, 1984) see irony as a prime example of the co-presence of different 'voices' in the text (see **Literary Pragmatics**), in ways that avoid the technical problems highlighted in the mention theories.

Irony: Stylistic Approaches

J Boutonnet, University of Wolverhampton,
Wolverhampton, UK

Most books or articles on the topic start with a warning that the concept of irony is elusive (Muecke, 1970) and that it takes many forms. Myers (1981: 410) said that “in irony we inherit both a device and a concept.” Nash (1985) alerted us to the lack of consistency in usage even among literary critics. Although dictionaries offer definitions and exemplifications, they point to the complexity of the phenomenon rather than enlighten the reader. The word has both positive and negative connotations today, a mark of its complex history and range of functions in discourse. The word does not appear in the English language until the 16th century and is only commonly used by speakers from the early 18th century onwards. Clearly the phenomenon existed before it was named, even prior to the Greek word from which the English word derives. The word *eironeia* to describe the Greek philosopher Socrates’s treatment of his conversational opponents is first recorded in Plato’s *Republic*. Socratic irony today refers to a discourse strategy whereby the speaker pretends he or she is learning from an interlocutor whilst trying all the while to uncover the flaws in that person’s argument (Nilsen and Nilsen, 2000).

Conveniently, a distinction is often made between situational irony and verbal irony. In the first we have an observer who notices a state of affairs or event which is in some way incongruous. The second is a rhetorical device. We have an ironist who produces a linguistic message whose meaning is other than the literal meaning, in many cases understood to be the opposite of the literal meaning conveyed. There is a discrepancy between the words and what the speaker means by these words, an opposition between the surface and the underlying meaning. This is also called traditional irony in most writings and is often attributed to Aristotle (Barbe, 1995).

An oppositional model of verbal irony holds that the speaker says the opposite of what he or she means. In this account, irony is unveiled by a process of substitution of lexical items or propositions. In the case of stable irony (Booth, 1974), where the intended meaning is fairly clear, as in “What a lovely day!” uttered on a day when the weather is anything but pleasant, meaning may be retrieved by word substitution (e.g., ‘lovely’ for ‘awful’), an example of lexical-antonymy. Oppositeness is at the heart of Raskin’s semantic theory of humor (STH) (Raskin, 1985)

where he discussed oppositeness in terms of local antonymy, two opposite meanings arising from a particular discourse. At the propositional level, consider Myers’s (1981: 411) example “I always wanted to spend the summer in Detroit,” uttered by a speaker who does not want to spend the summer in Detroit. Here we have an example of negation at the propositional level. Some linguists argue that examples like the one above constitute an instance of criticism coupled with a complaint, also known as nonce irony. Common irony refers to expressions which have become stock phrases in a language, such as “that’s a likely story!” (Barbe, 1995: 18–22).

When considering verbal irony, a number of assumptions need clarification. One often-debated issue is that of intentionality and sincerity of the ironist. Here the focus is on the production of an ironic text. This approach has been popular in stylistic analyses of literary texts, concerned with identifying devices employed by writers. The rhetorician Quintilian claimed that the ironist ‘intends’ to convey something which is other than what he or she says, thus effectively being insincere. Albeit not universally held, this view still finds many supporters today. Interestingly, the anti-intentionalist position is refuted on the basis that if the text can be read ironically, it is read “as if it were intended to be ironical” (Muecke, 1978: 364), highlighting the importance of the speech community’s conventions of usage over the individual speaker’s intentions. However, Gibbs *et al.* (1995) provided convincing evidence that intention is not necessary for irony to occur. They show that hearers are perfectly able to recognize the ironic meaning created by a sentence whilst knowing at the same time that the speaker’s intention was not to convey irony. It is true that instances of dramatic irony rely on this, as is the case when readers of a book, or an audience at a play, know something that the characters themselves do not know. In the world of theatre, the *ingénu* who utters sincerely the words of the playwright is a good example of unintentional irony. The speaker is separate from the ironist, the animator of the utterance distinct from the author of the utterance (Goffman, 1979).

Haiman (1990: 188) explained that the distinction between sarcasm and irony is rooted in intention. Whilst sarcasm is intentional, it is not a necessary condition for irony. “To be ironic, a speaker need not be aware that his words are ‘false’ – it is sufficient that his interlocutors or his audience be aware of this.” Sarcasm is often categorized as a form of irony and some researchers use the term interchangeably (Attardo *et al.*, 2003). However, for some, it is

a type of indirect criticism which is perhaps more personal and more blunt, and where the speaker's intentions to criticize are more obvious. Barbe (1995: 28) distinguished between the two by considering whose face is more threatened by the utterance. In the case of sarcasm she claims the speaker is compromising him- or herself, and thus a sarcastic comment constitutes a face-threatening act for the speaker.

As for the notion of double significance, and more precisely the clash between the literal and implied meaning, it is clear that the meanings are not necessarily in a relation of 'opposition' in the strict sense, as is often presumed. When making use of hyperbole it is possible to speak the truth whilst conveying an additional meaning. Myers's example of the comment "I love people who signal," uttered by a passenger after the driver attempts a left turn without signaling (Myers, 1977: 172), is a good case in point. Here the speaker is not saying she does not like people who signal, a negation of the declaration, neither is she being sincere about loving all people who signal. As well as exaggeration, understatement may be used ironically, effectively flouting Grice's maxim of quantity – which suggests that your contribution must be as informative as is required, but no more than is required, for the purposes of the current exchange (Levinson, 1983). The ironist is speaking the truth, but implies, by omitting to give as much information as is required, that there is a conversational implicature to be inferred by the hearer (see **Maxims and Flouting**). Ironical quotations and interjections do not fit into the traditional oppositional model of irony either.

Irony can make use of metaphors (see **Metaphor: Stylistic Approaches**). Overusing metaphors, placing unfitting metaphors, and juxtaposing unlikely metaphors are useful devices for the production of irony. In the case of explicit irony (as in a sentence starting with, for example, 'ironically' or 'isn't it ironic') the speaker brings to the recipient's attention an incongruous occurrence, communicating the nonverbal irony of fate. But in most instances of irony, which are implicit, inference is the key to uncovering the 'true' meaning. However, as with all instances of irony, interpretation is idiosyncratic and it is not certain that meaning will be recovered by the hearer. This has led many researchers to shift their focus away from the ironist to the recipient of the message (see **Irony**) (Kaufer, 1981; Giora, 1995; Giora and O'Fein, 1999a, 1999b).

Building on Sperber and Wilson's echoic interpretation model (Sperber and Wilson, 1981; Wilson and Sperber, 1992) and the pretense and theater models (Clark and Gerrig, 1984; Haiman, 1990), Clift (1999)

concluded that in naturally occurring conversations, irony is not necessarily located in the utterance itself, thus giving credence to the view that irony cannot reliably be identified on the basis of linguistic description alone. Irony emerges from dynamic conversational activity and is exploited by creative speakers as part of their turn-taking involvement. For Clift, irony may emerge from a flouting of a conversational expectation, a tension between 'slots' and the 'items' that fill them (Clift, 1999: 547). Irony in natural conversation serves an important discourse and social goal and is used in the management of interpersonal relationships (Norrick, 1993). It can be used to criticize whilst not losing face and at the same time minimize the threat to the face of the listener, thus adhering to rules of politeness. It can be used to display wit and solidarity and to affirm bonds between conversationalists too (affiliative vs. nonaffiliative purposes).

In pragmatics it is postulated that recognition of irony lies in the markers used to direct the recipient of the message to the right interpretation. Contextual clues can appear at all levels of language: word, clause, utterance, and discourse. In speech, pointers include kinesic (ranging from gestures to nods and smiles) and phonic (tone of voice, stress, pitch, etc.) markers. Another pointer to irony may come from the contribution being inappropriate in relation to the context or the cotext, even when on the surface the contribution seems relevant. Contradictory clauses are also a trigger. One indicator is the use of register clashes. During an informal conversation one might shift from an informal style to a formal style for ironic effect, for example, or insert phraseology which belongs to another field of discourse. An unusual collocation may alert the speaker (or reader) to the existence of an ambiguity. Jane Austen's opening sentence in *Pride and Prejudice*,

"It is a truth universally acknowledged that a single man in possession of a good fortune must be in want of a wife,"

combines overstatement ('universally,' 'must be') with a contradiction ('good fortune' / 'in want of') to indicate that the sentence must not be taken at face value. The choice of lexis points to an incongruity and alerts the reader to another intended meaning. Markers, however, are pointers and do not constitute irony *per se*.

Although verbal irony does not always imply a script opposition or negation of the literal message, it allows for a double perspective to be conveyed. This may explain why much irony falls into the realm of humor (see **Humor in Language**), as the perception of a contrast is at the heart of Incongruity Theories

and Surprise Theories (Goldstein and McGhee, 1972). Attardo (1994) placed the word 'irony' within the semantic field of humor, and claimed that irony and humor overlap significantly (Attardo, 2001). Others have argued that irony and humor share the same mechanisms (Giora, 1995). Irony is used to express an evaluative judgment, to convey an attitude about the interlocutor, an event, or more generally about some aspect of one's universe of belief (Martin, 1992) with the possible outcome that it can have the perlocutionary effect of being humorous, a desirable quality for most. For the recipient, satisfaction is gained from the process of decoding the multiple readings. In literature, techniques used by writers which signal that humor is present also enhance the reader's experience. Triezenberg (2004) explained that, for example, as a device, repetition with skillful variation is a potent humor enhancer. She also drew attention to the importance of cultural factors and shared background knowledge for ensuring that humor is decoded and fully appreciated. In order to achieve a "secret communion" (Leech and Short, 1981) between author and reader, a complex range of linguistic and nonlinguistic factors needs to be combined.

The general theory of verbal humor (see **Humor: Stylistic Approaches**) was developed to describe the conditions necessary for a short text to be considered humorous, and aims to provide an explanation of the cognitive processes involved in the processing of humorous texts (Attardo, 2001, 2002). From considering the structure of the joke, the theory has been extended to attempt to analyze humorous literary texts. Although some attest to its literary stylistics value, others argue that it is hitherto not adequate to account for the aesthetic qualities of literary writing (Triezenberg, 2004). Nevertheless, irony as well as humor is a linguistic resource which speakers and writers employ skillfully and acquire as part of their linguistic competence, and recognize in others' performance. No absolute agreement can ever be reached about incidences of irony and their interpretation, as usage as well as interpretations are rooted in the social and linguistic conventions of a particular speech community at a specific point in time. To the extent that any instance of language use can be analyzed using rigorous methods of linguistic and stylistic analysis, it is possible to say something about the mechanisms employed in the use of irony, even if the concept itself is constantly evolving.

J

Jakobson, Roman**N Kerecuk**, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Roman Osipovich Jakobson (**Figure 1**), an American philologist and linguist of Russian Jewish descent, was born in Moscow. He moved to Prague in 1920 and to the United States during World War II. He graduated from Moscow University and participated in the Russian avant-garde movement in literature. When he moved to Prague, he pursued his doctorate at the University of Prague. From 1933 to 1939, he taught at the Massaryck University, Brno, but left Czechoslovakia following the Nazi occupation. He then traveled to Uppsala in Sweden, to Denmark, and to Norway before leaving for New York in 1941. He taught at the École Libre des Hautes Études, a French/Belgian university in exile, accommodated by the New School for Social Research in New York. He then taught at Columbia University (1943–1949) before becoming a professor at Harvard in 1949 and at MIT in 1957. In 1982, Jakobson died in Boston, Massachusetts.

He was a prolific author, and much of his work was dedicated to literary studies, but his role in the development of structural linguistics is also important. There have been many studies of his publications in English, in particular throughout the twentieth century, but significantly less of what he published in Russian has been examined. Most of these primary sources are now available for research.

In Moscow, Jakobson, along with the other young intellectuals, and G. O. Vinokur and P. Bogatyrev in particular, were involved in the creation of the Moscow Linguistic Circle, taking part in the debates that began to develop in the second half of the nineteenth century on Slavic philology, poetics, dialectology, and folklore in the Old Russian Empire. After the death of F. E. Korsh (1843–1915), Jakobson chaired the Moscow Linguistic Circle until his departure for Prague. Traditionally, F. F. Fortunatov's Moscow School advocated a formal, logical approach to language study. A somewhat different treatment of the same themes predominated in St. Petersburg, where the OPOIAZ – Society for the Study of Poetic Language – was created in 1916 (it ceased to exist in

1923). Jakobson was a member of OPOJAZ, along with V. Shklosky, I. Tynianov, and B. Eikhenbaum. In St. Petersburg, the 'Kazan' School of J. Baudouin de Courtenay (1845–1929) and his disciples predominated. Both the Moscow Linguistic Circle and OPOIAZ are usually referred to as the Russian Formalists. However, influential studies in language, linguistics, and literature were not limited to these two centers in the Old Russian Empire and the Soviet Union: the city of Kharkov, with its university, was fundamental, as was the legacy of O. O. Potebnia, with his disciples, in Moscow, St. Petersburg, and elsewhere, and the activities of the Historical-Philological Society (created in 1876).

After moving to Prague, Jakobson met Prince Nikolai Trubetzkoy (1890–1938) at a time when Prague was a hub of intellectual activity enabled by the intellectual climate fostered by T. G. Masaryk. Jakobson's main interests in the period continued to center on Slavic philology and literary studies. He was one of the founding members of the Prague Linguistic Circle, along with V. Mathesius (who was president until his death in 1945) and N. Trubetzkoy, S. Karchevskij, and J. Mukařovský, among others. The Prague and Copenhagen centers became known as schools of structural linguistics. The former benefited from the Jakobson's move to the United States, where he promoted the Prague school.

The focus of Jakobson's writings during his Moscow and Prague periods is primarily aimed at literature, new art aesthetics, and philology (rather than linguistics), including Slavic philology, comparative philology, sound patterns and phonemics, literary language, the influence of folk literature on literature, folk songs, Futurism, aesthetics, poetics, versification, Russian and Slavonic culture and comparative mythology. It was after his arrival in the United States that Jakobson increased his output in phonology and, later, in linguistics, but he continued to describe himself as a Russian philologist.

There is still much research to be pursued on the evolution and sources of his ideas. For example, during the Moscow/Prague period, Jakobson wrote on literary themes and authors such as Trediakovsky (1915), Khlebnikov (1920, using his pen name

Figure 1 Roman Jakobson (1896–1982).

R. A. [Roman Aljagrov] and for his own poetry), Majakovskij (1931), Pushkin (1937), and Pasternak (1935).

Some of Jakobson's writings were dedicated to specific languages: Russian and its dialects, Czech, Bulgarian, and others. He also wrote on a number of linguists/philologists such as Durnovo (1926), Mathesius (1932), Shakhmatov (1920), and Peshkovskij (1933) (the latter two were disciples of O. O. Potebnia).

With P. Bogatyrev, he wrote on Slavic philology in Russia during the period of 1914–1921 (1922–1923). In the late 1920s, he produced two articles on phonetics and the phonological history of Slavonic languages. In 1931, he published a paper on the principles of historical phonology and entries on 'phoneme' and 'linguistics' for a Czech scientific dictionary in 1932 and 1935.

Jakobson was interested in identifying universals in languages, and he consequently disregarded relevant crucial differences. The idea of shared grammatical features as opposed to shared origin was part of his theory of universals. On the same basis, he postulated a development of the Slavonic verbal system (1932) based on a single stem. In 1936, he also published an article on the Russian/Slavonic case system based on the same idea. In 1938, he presented a paper on his theory of phonological affinities at the Fourth International Congress of Linguists in Copenhagen. In 1939, he wrote an article on the structure of phonemes. These pieces were the beginning of his work on phonology and linguistics.

In addition, in the 1920s and 1930s, Jakobson also had an interest in the sociology of language and national self-determination. These topics appeared in his

papers in 1920–1921 and 1931. The latter year focuses on the proposed Eurasian linguistic union within the Eurasian ideological movement proposed by Russian émigrés in the 1920s and 1930s, characterized by an idiosyncratic linguistic and cultural approach.

His 1941 *Kindersprache, Aphasie und allgemeine Lautgesetze* (Jakobsen, 1971a: 328–401) has generated much research, as it suggests that there might be a universal order in the acquisition of speech sounds. His cooperation with N. Trubetskoy resulted in the furthering of the theory of distinctive features for the phonemes – the components of sounds. A phonetic feature distinguishes one phoneme from another (e.g., voiced/voiceless). The presupposition in this theory is that a set of features is applicable to distinguish phonological differences in all languages.

The concept of distinctive features, along with other concepts related to sound patterns, sound, and meaning, were expanded after Jakobson arrived in the United States. The Technical Report for the MIT Acoustics Laboratory, *Preliminaries to speech analysis* (1952) was jointly published with G. Fant and M. Halle. With Morris Halle, in 1956, in *Fundamentals of language*, the authors put forward the idea that a set of 12 binary oppositions, a bundle of 12 features, would be sufficient to give an account of all of the distinctions in all languages. The languages differ only in the manner that they combine these features. This contributed to the subsequent developments in phonological theory. For instance, A. Martinet outlined his views on Jakobson's phonology in his 'Substance phonique et traits distinctifs' (1957–1958).

Jakobson promoted the application of linguistics to literature. Some of the concepts that he used were those of iconicity, markedness, metaphor and metonymy, and communicative functions. He created a model of communicative functions based on the work of Karl Bühler and others. He argued that a shared code was not sufficient, but a context was essential in the communicative function. The components of communication are the addresser and the addressee and context, message, channel, and code. Therefore, depending on the focus of the component of communication, the functions are emotive (focuses on the addresser's attitude to his or her own message; e.g., interjections and emphatic speech), conative (focuses on the addressee; e.g., vocative), referential (refers to the context), phatic (refers to the contact/channel of communication between two speakers), metalinguistic (refers to the code itself, language about language; i.e., metalanguage), and poetic (refers to the additional component of a message apart from content). Each piece of discourse requires an analysis to identify which of the above functions predominate.

The seven volumes of Jakobson's *Selected writings* (1962–1984) offer an outline of the main areas of

Jakobson's many interests. The correspondence of Jakobson with Trubetskoi and others in the interwar period (Toman, 1994) offers interesting insights into both the circulation of ideas and the characters of the personalities.

Jakobson's acquaintance with Claude Lévi-Strauss has generated another strand of interaction and influence. The 1980 *Dialogues* with Krystyna Pomorska (his last wife) is another source. *The sound shape of language* with L. Waugh in 1986 represents another element in the history of Jakobson's thoughts. There are many publications on his life and works. Equally there is a great deal of comment about his works by Jakobson himself. Indeed, the accounts of intellectual histories in language sciences and the other areas that interested Jakobson are selective and have not been sufficiently researched. His eleven essays edited by K. Pomorska and S. Rudy (1985) *Verbal art, verbal sign, verbal time* are meant to be mainly an introduction to his works in poetics but also have relevance to his linguistic ideas.

Language Attitudes

J Edwards, St Francis Xavier University, Antigonish, NS, Canada

© 2006 Elsevier Ltd. All rights reserved.

One grievous failing of Elizabeth's was her occasional pretty and picturesque use of dialect words – those terrible marks of the beast to the truly genteel.

Thomas Hardy (*The mayor of Casterbridge*, 1886)

It is impossible for an Englishman to open his mouth without making some other Englishman hate or despise him.

George Bernard Shaw (*Pygmalion*, 1912)

The operative class, whose massacre of their mother tongue, however inhuman, could excite no astonishment.

Thomas Hamilton (*Men and manners in America*, 1833)

(occasionally, at least) of the relative nature of social knowledge when we realize that others do not sort out their world in quite the same way as we do.

Perceptions operate in societies, most of which are stratified in various ways and in which – to put things bluntly – power and status are often able to translate social difference into social deficiency. Because language is one of the traditionally important social markers, it is not surprising that the study of attitudes has a central position in the social psychology of language. Nor is it surprising that the results of this study shed some light on the generalities just mentioned. It is easy, for example, to demonstrate that great variation exists in terms of people's reactions to (or evaluations of) different accents and dialects. The question, of course, is what to make of this variation.

Introduction

The most basic theme in modern social psychology is the importance of perception. We do not react to the world on the basis of sensory input but, rather, in terms of what we perceive that input to mean. This is the foundation of all our social constructions, of all our individual and group relationships, and it is a foundation that reflects – in ongoing fashion – our accumulated social knowledge. Perception is the filter through which sensory data are strained, and the establishment and maintenance of this filter is culturally specific and – within social groupings – individualized to a greater or lesser extent. For example, because every individual has accumulated a unique set of experiences, each set of perceptual spectacles is itself special to some extent. At the same time, there are many social perceptions that group members hold in common: at one level, we can think of these as stereotypes, at another as culture itself. At a group level, the most important feature has to do with the acceptance of shared understanding. In a great many instances, this is the only sort of understanding to which we have access, and we sometimes fall prey to the idea that **our** understanding is, in fact, the only sort possible. Nonetheless, we are aware

The Basis of Judgment

Social preferences and prejudices concerning language varieties are long-standing and of continuing potency. This is because views of language correspond to views of the social status of language users; in this sense, language (or dialect or accent) provides simple labels which evoke social stereotypes that go far beyond language itself.

We can begin here by observing that even dictionary definitions of dialect and accent help to sustain the view that nonstandard language is less correct language. The *Oxford English Dictionary* (OED), for example, notes that dialect may be considered as “one of the subordinate forms or varieties of a language arising from local peculiarities of vocabulary, pronunciation, and idiom.” This definition is implicitly held by those for whom the term ‘dialect’ conjures up an image of some rustic, regional speech pattern; for such people, the ‘standard’ variety (see below) is not really a dialect at all; rather, they consider it as the ‘correct’ form from which all others diverge. On accent, the OED is not much better; it is, we find, a mode of utterance which ‘consists mainly in a prevailing quality of tone, or in a peculiar

alteration of pitch, but may include mispronunciation of vowels or consonants, misplacing of stress, and misinflection of a sentence.'

But what is the basis for language attitudes and judgments? Three broad possibilities suggest themselves.

Intrinsic Difference

One possibility is that language attitudes reflect intrinsic differences across and within language varieties themselves. That is, the reason for variety A being evaluated so much more favorably than variety B is simply that A is a linguistically superior form. Although this is a view that has had considerable historical support, and while it remains common at a popular level in virtually all linguistically stratified societies, linguists have convincingly demonstrated that to see languages or dialects in terms of innate superiority or inferiority is to profoundly misunderstand the nature of human language itself:

just as there is no linguistic reason for arguing that Gaelic is superior to Chinese, so no English dialect can be claimed to be linguistically superior or inferior to any other ... There is no linguistic evidence whatsoever for suggesting that one dialect is more 'expressive' or 'logical' than any other, or for postulating that there are any 'primitive', 'inadequate' or 'debased' English dialects. (Trudgill, 1975: 26)

A very good demonstration of this was provided by William Labov (Labov, 1976). He studied Black English (in the United States), which makes an excellent test case for dialect validity since it had for so long been rejected by the white middle class, and since its speakers were victims of a prejudice that went well beyond language alone. If it could be shown that Black English was not some debased variety, this would go some way towards establishing linguistic integrity for all dialect varieties.

There were three strands to Labov's work. First, he justly criticized earlier studies which had elicited Black English from youngsters through interview techniques which were both unfamiliar and intimidating; these were hardly likely, he noted, to produce normal, conversational samples. Second, Labov reminded us of what casual observers had known for a very long time – the Black community is verbally rich and, like other 'oral' cultures worldwide, supports and rewards those who are particularly linguistically gifted. Third, and most important of all, Labov demonstrated the regular, rule-governed nature of Black English. Rules are of course an essential feature of language, and if it were possible to demonstrate formal grammatical regulation within Black English – not necessarily identical, of course, to regulation in other dialects – then charges of inaccuracy and

sloppiness would become groundless, and it could not be dismissed as some 'approximation' to 'proper' English.

As an example, here is one of the rules Labov described for Black English, a practice called 'copula deletion.' In a sentence such as *she the first one started us off*, the *is* is not present. Does this mean that the Black speaker who uttered it is unaware of this verb form? Well, consider another sentence taken from a Black corpus: *I was small then* – here, the past tense of the verb 'to be' appears. Why should it figure in this sentence but not in the former one? Labov's work revealed the regularity governing this linguistic behavior: in contexts in which the standard variety permits verbal contraction (e.g., *they are going* can become *they're going*), Black English allows deletion (e.g., *they are going* can become *they going*). We have, therefore, a rule – slightly different from the one obtaining in the standard, but no less logical. The regularity is further evidenced by the fact that, in contexts in which the standard does not allow contraction, there is no Black English deletion: *he's as nice as he say* *he's* is patently incorrect according to the rules of the standard variety, which outlaws contraction in the final position. In like fashion, it is incorrect to say *he's as nice as he says* *he* in Black English.

The import of this sort of work is clear: there are no substandard language varieties. There are standard dialects in many languages, and so it logically follows that all others must be nonstandard – but this latter term is not pejorative in any technical linguistic sense. A standard dialect is, roughly, that spoken by educated people, and it is the form usually found in writing. Its position derives from history and from the social standing of its speakers. If York instead of London had become the center of English power, for instance, then the traditional BBC newsreader would sound quite different, and schoolteachers would be promoting another form of 'correct' English in the classroom.

Aesthetic Difference

Another possibility might be that language varieties – although not to be seen (grammatically or 'logically') in terms of 'better' or 'worse' – do actually vary in their aesthetic qualities. Perhaps, then, more favorable attitudes might attach to those varieties that sound better, or more mellifluous, or more musical. Many years ago, for instance, standard English was defended as 'one of the most subtle and most beautiful of all expressions of the human spirit' (Chapman, 1932: 562) and, a little later, Henry Wyld, a linguist at the University of Liverpool, wrote:

If it were possible to compare systematically every vowel sound in RS [Received Standard English – i.e., what we

now more usually call RP, Received Pronunciation] with the corresponding sound in a number of provincial and other dialects, assuming that the comparison could be made, as is only fair, between speakers who possessed equal qualities of voice, and the knowledge how to use it, I believe no unbiased listener would hesitate in preferring RS as the most pleasing and sonorous form, and the best suited to be the medium of poetry and oratory. (Wyld, 1934: 610)

I need hardly say that such sentiments were (and are still, of course) not restricted to those speaking in and for English. Can we put to the test, however, the belief that dialect A is more aesthetically pleasing than dialect B?

Recent studies have compared an ‘inherent value’ hypothesis here with an ‘imposed norm’ one. The former term suggests, as Wyld did, that aesthetic qualities are intrinsic, while the latter holds that they are attached or imposed by the listener, who, in hearing a standard (for instance), considers it mellifluous because of the status of its speakers. In one investigation, Welsh adults listened to European French, educated Canadian French and working-class Canadian French voices. Asked to rate the pleasantness and prestige of the voices, the judges – who were virtually ignorant of French – did not single out any of the three varieties. Earlier studies had shown, however, a clear aesthetic preference among French speakers for European French. In another experiment, British undergraduates who knew no Greek evaluated the aesthetic quality of two Greek dialects, the Athenian and the Cretan: the former is the prestige standard form, while the latter is a nonstandard variant of generally low status. As in the French study, no significant differences between the two dialects were found. If anything, there was a slight tendency for these British students to rate the Cretan variety as more pleasant and prestigious than the Athenian (Giles *et al.*, 1974, 1979).

The important element in these demonstrations is that the judges were unaware of the social connotations possessed by the different varieties in their own speech communities. The implication is that, if one removes (experimentally) the social stereotypes usually associated with given varieties, aesthetic judgments will not be made which favor the high-status standards. Anyone who watches a film or a play in which (for example) a woman dressed as a duchess speaks with a Cockney accent can appreciate the point here: someone in the audience who had an understanding of English, but not of more subtle intralinguistic variation and convention, would miss a great deal of the comedic effect. The norms here are imposed by those in the know, and the stereotypes which link beauty, or harshness, or

comedy to a particular set of sounds are unavailable to others. (None of this, I hasten to add, rules out purely individual preferences: I may think Italian is the most beautiful language, you may believe that Gaelic is unrivalled – but we can agree to differ on a matter of subjectivity.)

Social Perception

We now turn to a third possibility, which – because we have eliminated the first two – becomes the most likely: the variant evaluations found in the social laboratory and on the street reflect perceptions of the **speakers** of given varieties; any qualities – ‘logical’ or aesthetic – of the varieties themselves are, at best, of very secondary importance. Thus, listening to a given variety acts as a trigger or a stimulus that evokes attitudes (or prejudices, or stereotypes) about the community to which the speaker is thought to belong.

A general moral here seems to be this: when social stratification is associated with linguistic variation, the variety used by those with social clout will commonly be perceived as (grammatically, lexically, or phonologically) superior to nonstandard forms. There are two exceptions to this rule, and they occur at opposite ends of the status continuum. First, extremely high-status varieties may seem affected and generally over the top. Second, there is a ‘covert prestige’ possessed by working-class speech, with its positive associations of masculinity. Research has found that both working-class and middle-class males claimed to use nonstandard forms even when they did not customarily do so (Edwards, 1989; Trudgill, 1983). The actual use of such forms, by generally standard-speaking individuals, is most likely when the speaker wants to appear forceful, direct, and unambiguous. An example: a friend of mine, a middle-aged, upper-middle-class American university professor (male), was being pressed by colleagues (also male) on a departmental matter. Finally, he ended a rambling and inconclusive discussion – one that had unfolded according to the norms of standard, educated American English – by smiling broadly and saying, “Listen, boys, you **know** the’ ain’t no way I can do it.” All-male social gatherings, as at least half the readers will know, often produce such examples.

Variation in Social Attitudes

If we reject linguistic and aesthetic arguments as the real underpinnings of variations in language (and speaker) evaluation, we have only cleared away some annoying underbrush. It is very useful to know that the basis for language evaluation rests upon

social convention, but we must make more detailed inquiries about the assessment of language varieties. We come then, to language attitudes *per se*.

While many regional or class dialects are perceived unfavorably, there is more than a simple dichotomy between good (standard) and bad (nonstandard). Urban speech patterns (such as, in Britain, those of Birmingham, Glasgow, and Liverpool) are generally seen as more unpleasant than are rural varieties (Devon English, for instance). Again, the basic explanation rests upon social connotation: for many, rural areas have a charm that is absent in heavily urbanized, industrialized centers. So rural dialects, although not as prestigious as the standard, may be viewed more favorably than urban varieties (which are often tied more closely to class differences, as well) (Wilkinson, 1965; Trudgill, 1975).

Wyld (above) hinted at an important problem in the comparison of language varieties. If I wish to find out which of two dialects is the more pleasant (for example), and if I therefore record a speaker of each and have the voices judged by listeners, to what can I reasonably attribute any differential ratings that may be found? Are they due to features of the dialects themselves? Might they not also be reactions to purely individual qualities of voice – tone, pitch, rhythm, pace, and so on? A way around this difficulty was devised in the 1960s by Wallace Lambert. In his ‘matched guise’ method, judges evaluate a tape-recorded speaker’s personality after hearing him or her read the same passage in each of two or more languages, dialects, or accents. The fact that the speaker is, for all ‘guises,’ the same person is not revealed to the judges (who typically do not guess this). Any variations in the judges’ ratings can then be considered as reflections of their stereotyped reactions to the different language varieties, since potentially confounding individual variables are of course constant across guises (see Lambert *et al.*, 1960; Edwards, 1989).

A large number of studies have shown that evaluations of different varieties vary in nonrandom ways. Thus, standard accents and dialects usually connote high status and competence; regional, ‘ethnic,’ and lower-class varieties are typically associated with greater speaker integrity and attractiveness. Ellen Bouchard Ryan and her colleagues (Ryan *et al.*, 1982, 1984) have attempted to summarize the many language attitude studies by providing an “organizational framework.” They suggest that there are two determinants of language perceptions: standardization and vitality. The important point about the standard here is that it is a variety whose norms have been codified and have become associated with social dominance. Vitality refers to the

number and importance of functions served, and is clearly bolstered by the status which standards possess; it can also be a feature, however, of nonstandard varieties, given sufficient numbers of speakers and community support. Furthermore, two particularly salient evaluational categories account for most of the variance: social status (which is more or less equivalent to competence) and solidarity (roughly combining integrity and attractiveness) (see Edwards, 1992).

These findings are interesting for several reasons, but the single most important factor is their stereotypical nature: people are evaluated in terms of characteristics that, in a broad-brush sort of way, reflect perceptions of the group to which they are seen to belong. The implication is obvious: **individuals** – with all their personal strengths and weaknesses – are viewed in stereotypical **group** terms. Studies have suggested that at school, in the workplace, in counselor–client relations, and so on, negative stereotypes can create problems. (It is also worth remembering here that stereotyping can operate in the opposite direction, too – those with the socially ‘right’ attributes may have their progress unfairly expedited.)

Difference, Deficit ... and Solidarity

In the Classroom

More than three decades ago, John Gumperz and Eduardo Hernández-Chavez made the following observation: “Regardless of overtly expressed attitudes ... teachers are quite likely to be influenced by what they perceive as deviant speech ... thus potentially inhibiting the students’ desire to learn” (Gumperz and Hernández-Chavez, 1972: 105). Obviously, like other members of society, teachers have language attitudes, and it is not surprising to find that, on the whole, they have downgraded nonstandard varieties and, by extension, the capabilities of their speakers. Trudgill (1975: 63) noted, for example, that teachers were not averse to telling (some of) their pupils that their speech was “wrong ... bad ... careless ... sloppy ... slovenly ... vulgar ... gibberish.” A study conducted in Nova Scotia (Edwards and McKinnon, 1987: 335) found similar teacher attitudes: one said that poor children were unable to “articulate their thoughts”; another observed that “Blacks have a slang language all their own – they will not use proper English when the opportunity arises.”

Teachers’ points of view are, in one sense, merely a particular illustration of a much broader relationship between linguistic variation and social attitudes.

But in another sense, their beliefs are special – for the obvious reason that negative evaluations of children's speech styles may lead to real problems, in the classroom and beyond it. It is a cruel irony that socially disadvantaged children, who clearly struggle under all sorts of very real burdens, should be weighed down still more by evaluations of the inadequacies of their language – when these evaluations are typically based upon inaccurate assumptions. The negative reactions to their speech patterns do, however, reveal how hollow a purely academic sense of 'inaccurate assumptions' can be, in a world where attitudes can transform difference into deficit.

'At Home'

Given the strength and pervasiveness of language attitudes, there are strong tendencies for speakers of nonstandard varieties to accept, themselves, the evaluations of others (the so-called minority group reaction is an example here; see Lambert *et al.*, 1960). While the sense that one's own speech is not very 'good' may be a common phenomenon, it is nonetheless a disturbing one – as the description above of the educational arena makes clear. Thus, Halliday (1968: 165) noted that

a speaker who is made ashamed of his own language habits suffers a basic injury as a human being; to make anyone . . . feel so ashamed is as indefensible as to make him feel ashamed of the colour of his skin.

Beyond the obvious recommendations for greater linguistic awareness and sensitivity, one might also ask just why low-status speech varieties continue to exist. If they are generally considered inferior, why wouldn't speakers try to eradicate them? Why wouldn't language or dialect shift be a more popular option? Nonstandard speakers are hardly without adequate models for language alteration, after all. Nowadays, more than ever before, the ubiquity of the broadcast media means that virtually all have at least a passive awareness of standard forms (and research has shown how easy it can be for this to be translated into a more active quantity) (Edwards, 1989). Indeed, many years ago it was predicted that a leveling of variant speech styles would be the inevitable consequence of the wired world. But it seems not to have happened.

We have to bear in mind here that the solidarity function of **any** common language is powerful; even a low-prestige variety can act as a bonding agent, reinforcing group identity (see the focused discussion in Ryan, 1979). Group identity and its (linguistic and other) markers are known quantities and, in that sense, 'safe'; on the other hand, attempts to alter speech styles may be risky. Failure may lead

to marginalization – a sense of not being a full member of any social group. Even success may prove too costly. A Mexican American who abandoned Spanish was labeled a *vendido* (Carranza and Ryan, 1975), a 'sell-out,' a defector to the other side. A French Canadian in analogous circumstances was a *vendu*. Cockney grandparents once told their grandchildren that, if they tried to speak in a 'la-di-da' accent, their mates would call them 'queer' (Bragg and Ellis, 1976). Whatever the current status of these well-known if somewhat dated cases, it is clear that the principle remains powerful. Finally here, nonstandard speakers may also refrain from attempting to alter their language patterns if the exercise is considered to be pointless – as it may be seen to be for those who are members of visible minority groups, for instance. If reactions to Black English are reflections of social evaluations of Black speakers, then learning and using some more standard form may be a waste of time. The social difficulties faced by Blacks occur largely because they are black, not because they do not use standard English (consider, for example, that there are many nonstandard-speaking Whites in comfortable circumstances).

Language Attitudes and Language Acquisition

One important aspect of attitude study has been its connection with the learning of second (and subsequent) languages. Positive attitudes, it is generally thought, are likely to facilitate second language acquisition, although it is realized that variations in the context and the perceived functions of the new medium are also important. Indeed, this has very much been the received wisdom, and there is a large literature on attitude and motivation in language learning. John Macnamara, however, appeared to take an opposing view, asserting that attitudes were of little importance in language learning (Macnamara, 1973). His argument is worthy of some attention here, since it leads to some finer-grained attention to language attitudes generally (see also Edwards, 1995).

Macnamara noted that necessity may overpower attitude – and this is clearly true. The adoption of English by the Irish, for instance, was a shift not generally accompanied by favorable attitudes; indeed, most historical changes in language use owe much more to socioeconomic and political pressures than they do to attitudes *per se*. But perhaps attitudes of a sort – instrumental attitudes – do play a part in language shift. A mid-19th-century Irishman may have hated English and what it represented, while still acknowledging the necessity and long-term

usefulness of the language. A pragmatic or 'instrumental' motivation need not imply the deeper, 'integrative' motives so dear to the hearts of teachers keen on introducing their charges to new languages and new cultures. Similarly, there may be a useful distinction here between positive and favorable attitude; to remain with the Irish example, we might say that the attitudes towards the learning of English were positive and instrumental, but not necessarily favorable or integrative. (It must be acknowledged, of course, that instrumental-integrative and positive-favorable distinctions may change or disappear as language shift develops.)

Macnamara went on to contend that pupils' language-learning attitudes at school were also relatively unimportant. Language in the classroom, he said, was typically an unreal and artificial business, with communication subordinated to narrow academic concerns that fail to engage children's interest. It is this situation, and not pupils' attitudes, that underlies the traditionally poor results of school language programs.

Now, it is undoubtedly true that a great failing in language classrooms has been the absence of realistic usage, but I do not think that this implies that attitudes are of small importance. The argument that the classroom is artificial is essentially a condemnation of approaches and practices, and does not of itself indicate that attitudes are trivial. In fact, attitudes may be of considerable importance precisely because of 'artificiality' – i.e., where a context is **not** perceived as pertinent to real life, or is **not** seen to be necessary, attitudes may make a real difference. The importance of favorable attitudes, then, may vary inversely with real linguistic necessity (Edwards, 2001).

Details and Directions

Within social psychology, 'attitude' is a disposition to react favorably or unfavorably, a disposition with three components: feelings (the affective element), thoughts (the cognitive element), and a resultant tendency to action (the behavioral element). One knows or believes something, has some emotional reaction to it, and then does something about it. Two points, however, should be made.

There is often considerable inconsistency between attitudes and actions. In a classic study, a Chinese couple (accompanied by the experimenter) toured the United States in the early 1930s. Visiting about 250 hotels and restaurants, they were refused service only once; however, when the investigator later wrote to the places visited, he found that more than 90% said they would not serve Chinese people (LaPiere, 1934). There are, of course, many possible

reasons for this finding: immediate self-interest, a desire to avoid embarrassment, a difference between reactions to an ethnic group abstraction and assessments in concrete instances, and so on. But the inconsistency remains.

The other point is that there is often confusion between attitude and belief – a confusion particularly noticeable within the language attitude literature. For example, the answer to a questionnaire item such as 'Is a knowledge of French important for your children, yes or no?' reflects a belief. To gauge attitude would require further probing into respondents' feelings about the expressed belief. It would clearly be incorrect to assume that the answer 'yes' implied a favorable attitude: the informant could grudgingly accept that French was important for career success, while loathing both the language and its culture.

More attention to these distinctions – apart from simply improving accuracy – might be salutary in terms of understanding why evaluations take the forms they do. Given that unfavorable reactions to nonstandard varieties have typically been discussed in terms of status or prestige differentials, for instance, it could be useful to confirm this, from the respondents' point of view, by asking them the bases for their evaluations. Such an exercise might be of special interest since – as has been mentioned above – nonstandard varieties elicit positive ratings along some dimensions. It is surely reasonable, after all, to gather as much information as we can from the actual participants in language studies, as well as imposing more purely theoretical interpretations upon their responses (Edwards, 1995).

Language attitude study should perhaps be prepared to expand its scope. Various methodologies have produced a sizable body of evidence bearing on social perceptions, stereotypes, and language attitudes. We can now predict with some confidence what sorts of reactions are likely when people hear varieties of (for instance) Black English, Newfoundland English, Cockney, Received Pronunciation, Boston English, and many others; we can also make predictions about those 'ethnic' varieties produced by nonnative speakers of English that show the influence of the first language. We understand, at a general level, how these reactions come about, via the linguistic 'triggering' already noted, and how they reflect a set of attitudes (or beliefs) – often of stereotypical nature – that listeners have of speakers. Investigators have not, however, gone very much beyond fairly gross explanations; that is, they have typically not related speech evaluations to particular speech attributes. Thus, although hundreds of experiments have revealed negative reactions towards Black English,

we have virtually no information relating specific linguistic attributes of that variety to such reactions – attributes that might include pronunciation patterns, particular grammatical constructions, or the use of dialect-specific lexical items (or, of course, any combination of these) (Edwards, 1999).

Some moves have already been made in this direction. For example, in 1982, Howard Giles and Ellen Bouchard Ryan issued a call for “more detailed linguistic and acoustic descriptions of the stimulus voices as well as examining the relative evaluative salience of these particulars for different types of listeners” (Giles and Ryan, 1982: 210). A related, although not so pointed, observation was made by Edwards, in calling for fuller probing of the reasons behind the evaluative decisions made by informants (Edwards, 1982; see also above). In general, though, social psychologists have done little in the way of isolating linguistic and acoustic variables and relating them to evaluative judgments. Such work has simply not been their *métier*.

It is in linguistic research that we find descriptions of features that characterize and differentiate language varieties. In recent years, a considerable amount of work has been done here; for example, linguists (including Laver and Trudgill, 1979 – in a book on social markers that remains a valuable reference) have pointed out such phenomena as:

1. the nasality habitually associated with some (RP, for example) but not all varieties of English;
2. the wide dialectal variations in consonant pronunciation: thus, RP speakers pronounce *lock* and *loch* more or less identically, with a final /k/, but (some) Scottish pronunciations involve final /x/. Another example: in British English, pronouncing the postvocalic /r/ in words like *cart* and *mar* is inversely related to social-class status, whereas in some varieties of American English (e.g., New York English) a positive correlation exists between /r/ pronunciation and status;
3. grammatical variation: copula deletion in American Black English, for example (as we have seen, above);
4. lexical differences: some English speakers *brew* their tea, some *mash* it, some let it *steep*, some let it *set*, and so on.

If, however, linguists have been the ones to describe such variation, they have either been relatively uninterested in its relation to variations in social evaluations, or have simply assumed that the more obvious and salient linguistic markers are the triggers for differentiated ratings. Like social psychologists, linguists too have generally stuck to their lasts – although a recent and most welcome collection

(Milroy and Preston, 1999) deals explicitly with linkages between linguistic features and attitudes.

Conclusions

There are many important aspects of language attitudes and their ramifications that it has not been possible to attend to in this brief overview. One has to do with the relationship between language and gender. The ‘covert prestige’ briefly noted above, for instance, is essentially a male phenomenon – the positive connotations of nonstandard speech are not typically found among women; indeed, where middle-class male informants may report more non-standard usage than is actually the case, female respondents overreport standard dialect usage. A large literature suggests, generally, that women are often more linguistically conservative than are men, that they produce ‘politer’ and more ‘correct’ speech, that there are significant gender differences in lexicon and function, and so on. All of these features are influenced by, and reflected in, language attitudes (see Coates, 1993 for a good overview).

Another important area with a burgeoning literature has to do with the accommodations made by speakers in different contexts and with different interlocutors. Linguistic accommodation can take many forms but, whether it operates at or below the level of conscious awareness, its fundamental feature is the modification of speech patterns to converge with, or diverge from, those of others. Accommodation can reflect individual concerns – wanting to sound more like the boss, or intentionally departing from the usage of someone you dislike – or group ones: you may wish to emphasize your ‘in-group’ membership, or to solidify an ethnic or class boundary. Once again, attitudes clearly underpin practices (for an overview here, see Giles and Coupland, 1991; Robinson and Giles, 2001).

What I have tried to deal with in this article is some of the central themes in the area, some of the scaffoldings on which other aspects rest. They include the following:

1. some basic definitional and terminological matters: it is always important to be clear about terms and meanings, and especially so when – in areas such as this – the terms have broad popular connotations as well as more narrowly academic ones;
2. the bases upon which linguistic judgments are made: most people still believe that intrinsic qualities of language varieties can reasonably underpin rankings of ‘better’ and ‘worse.’ The persistence of this belief is disappointing, to say the least, especially in educational circles;

3. the manner in which linguistic difference is typically translated into linguistic deficit: it is evident that, linguistic enlightenment notwithstanding, society continues to deal rather bluntly with variation – and, if most consider a difference to be a deficit, then it becomes one;
4. the ways in which linguistically stigmatized individuals and groups come to accept the judgments made of them by ‘outsiders’: this is an extension of the previous point, insofar as it is a potent reflection of the power of social pressure;
5. the reasons behind the persistence of low-prestige varieties: given the potency of social pressure and prejudice, it is interesting that group solidarity, on the one hand, and fear of personal marginalization, on the other, are sufficient to maintain stigmatized varieties;
6. the evaluative dimensions and categories that seem to be employed when ranking different language varieties: the regularity with which a few basic categories (such as ‘competence,’ ‘integrity,’ and ‘reliability’) appear across a very wide range of studies is one of the most robust features in language study;
7. language attitudes in contexts of learning and shift: questions of how, and to what extent, attitudes and motivations are important in situations of change – or potential change – throw light upon both the attitudes and the contexts;
8. the need for greater interdisciplinarity in what are sometimes called, hopefully, the ‘language sciences’: a common criticism of modern social psychology involves its allegedly disembodied character – further and deeper attention to language, and language attitudes, would at once redress academic oversight and inevitably abet interdisciplinary linkages that would, in turn, reduce decontextualization.

Language Change and Cultural Change

J H Hill, University of Arizona, Tucson, AZ, USA

Human languages are inherently variable and dynamic, and their shifting shapes are constrained by diverse factors. Culture, defined as those human projects which endow the raw materials of our world – including the stuff of language – with meaning, must be among these. But to explore relationships between language change and cultural change requires appreciation of the immense complexity of cultural mediation, and linguistic analysis at a high level of detail and delicacy.

Several basic observations are required prior to developing this theme. First, 'languages' do not map isomorphically onto 'cultures.' From this obvious fact it is immediately clear that the relationship between language change and cultural change will not be straightforward. Mutually intelligible varieties of large regional and world languages are found among people involved in very diverse ways of life. Mutually intelligible varieties of Spanish are spoken by peasants in Mexico and philosophers in Madrid. Conversely, people who share very similar ways of life may speak several different languages. The Pueblo Indians of the southwest United States constitute a highly coherent and relatively homogeneous culture area, with a long history of contact and exchange among their communities, but speak at least five mutually unintelligible languages belonging to three different language families, plus one isolate. Local language ideologies work to minimize convergence among these languages (Kroskrity, 1993).

Second, resonances between language change and cultural change tend to be quite local. Linguists correctly greet global generalizations with profound suspicion. For instance, there is no universal correlation between the elaboration of sexism and gender-based discrimination in a society and the grammaticalization of gender in its language or languages. In an exceptionally careful study of this question, Chafe

(2002) explored the relationship between gender roles and the grammar of gender in Northern Iroquoian. In several languages of the group, a set of masculine pronominals distinguishes singular and plural forms and subject and object case. A feminine gender pronominal has developed from an original 'nonspecific' pronoun, and in the nonsingular is not distinguished from neuter gender. Chafe argued that contrastive elaboration of masculine gender versus feminine gender pronominals, which occurred about a thousand years ago, is in resonance with the prominence given to males in many Northern Iroquoian cultural scenarios (although Northern Iroquoian societies are matrilineal). However, he noted that such male prominence is extremely common in human communities, yet most languages do not show the same kind of differential elaboration of gender marking. For this reason, he preferred to speak of a cultural 'motivation' for the pattern, rather than of a cultural 'cause.'

In the Northern Iroquoian example, the structure of the pronominal system is unlikely to be prior to, and motivating of, the prominence of male roles. Instead, male prominence motivated the elaboration of the masculine pronouns. The diverse developments of noun classification through plural marking in the Uto-Aztecan languages (Hill and Hill, 1997) provide another case of the cultural motivation of linguistic patterning, in this case a loss of elaboration. In Proto-Uto-Aztecan, reduplicated plurals marked a class of human nouns, as against other nouns pluralized with suffixes. In two descendant language groups, the O'odham or Upper Piman languages and Hopi, the marked class has been extended beyond human nouns to classify for 'protrusion' and 'intrusion.' In Tohono O'odham (a Uto-Aztecan language of Arizona), spoken in a community that observed patrilineal descent, lineage exogamy, and patrilocal residence, the marked plural class includes kinship terms for women and kin linked to ego by women, but not kinship terms for men. This resonates with local understandings, expressed in legends, that inmarrying women stand as marked outsiders to the patrilineal

kin group. In contrast, in Hopi, with matrilineal descent and matrilocal residence, the only marked plural kin terms are the words for 'bride, inmarrying woman' (an outsider from the point of view of the husband's matrilineage) and 'husband, inmarrying man' (an outsider from the point of view of the wife's matrilineage). That is, the metaphor of 'outsiderness' functions in the noun classification system in the kin terms of both languages, but is greatly restricted in Hopi, consistent with the understanding there that descent through females constitutes the core social unit, the matrilineage. It seems most unlikely that patterning in the pluralization of kin terms would shape social organization, but quite reasonable that understandings of social organization would motivate the use of marked versus unmarked plural forms.

The loss in English of the distinction, otherwise nearly universal in European languages, between a polite/distant and an intimate/solidary second-person pronoun provides another example of such culturally motivated language change. Most scholars believe that the English T-pronouns, the intimate/solidary second person forms *thou*, *thee*, *thy*, *thine* were lost in ordinary usage in the late 17th century in reaction to the linguistic practices of a dissident religious sect, the Society of Friends or Quakers. Friends, consistent with their belief in the equality of all human beings before God, refused to use the V-pronouns that signaled social distance and deference. This practice was scandalous in a society where a regard for hierarchy was hegemonic and the use of a T-pronoun could constitute insult or even illegal *lèse majesté* that might lead to imprisonment. Rather than risk being taken for a Quaker, other speakers displayed their commitment to hierarchy and propriety by generalizing the V-pronouns even to contexts that had hitherto called for the use of the T-form without any presupposition of insult or disrespect. Regardless of whether the role of Quaker innovation has been properly understood, it seems likely that cultural ambivalences and ambiguities about hierarchy in the emergence of modernity shaped the gradual loss of the T/V distinction in English, rather than that the loss of the T/V distinction motivated a reorganization of British social order.

Benjamin Whorf, often misunderstood as a linguistic determinist, outlined in his most significant paper (Whorf, 1956) a dialectical interaction between language change and cultural change that attempted to account for examples like those above. Silverstein (1976, 1979, 1996) has proposed a contemporary semiotic refinement of Whorf's ideas. He argues that general semiotic principles underlie the development of such resonances between language change and culture change. These principles produce a 'dialectic

of indexicality' which drives analogical change. First, speakers project referential functions on to indexical functions and 'objectify' these. In the case of the English (and other European language) pronouns reviewed above, Silverstein suggests the following chain of analogies. The third-person pronouns exhibit apparent referential distinctions of number and gender, which are taken by speakers to refer properly to things in the world – although these 'things' achieve their 'naturalized' status, of course, precisely through linguistic practice and specifically through indexicality. But speakers come to see this indexical projection as 'reference.' By analogy, the social hierarchy distinctions of the T/V contrast in the second-person pronouns, which are technically indexical, can be taken by speakers to be referential as well. Thus to English speakers the social world came to be seen as consisting of individuals possessing an inherent property of meriting deference, parallel to inherent properties of gender, or of singularity versus plurality. Such analogical reasoning permits speakers to manage social anxieties (Inoue, 2004), by trying to bring usage rigidly into line with an understanding of the world that has precisely been projected from language in the first place. Such 'iconizing' (Gal and Irvine, 1995) projects do not always succeed in taking a language change to completion, but it is clear that the constant interplay of indexical orders (Silverstein, 1996), motivated by specific cultural anxieties and ambivalences that must be ever present in human communities, constitutes a powerful force for language change.

Among the kinds of change that can be driven by the 'dialectic of indexicality' is the formation and spread of styles and registers. An excellent example is the shift in American English in the stylistic features thought to be appropriate to the talk and text of ministers, political orators, and the like in their public roles. Cmiel (1990) has shown that an explicit ideology of egalitarianism emerging through the end of the 18th and the first half of the 19th centuries led to the development of the so-called middling style for elevated language. In the middling style ordinary vernacular words and short sentences came to be favored. This process of reshaping public language as an icon of the American egalitarian imaginary continues to develop. The grammar and lexicon of documents such as the Declaration of Independence and the U.S. Constitution strike many 21st-century Americans as forbiddingly elevated and elite. Even liturgical language has been simplified: new translations of the Christian Bible are in strikingly everyday language, and ministers of the gospel experiment with vernacular forms (as in the famous case of Cornell West, a minister and professor at Harvard University, who

recorded a compact disk of raps, a genre that originated in African-American street culture). Highly placed American politicians can use quite vulgar language, even in elevated public contexts, without facing censure – indeed, such language may bring approbation. It marks them not only as ordinary people with a commitment to egalitarianism, but as plain-speaking ‘straight shooters.’ It is perhaps not surprising that the tendency toward ‘plain speech’ in public forums has reached new heights (or depths) at precisely a period when increasing political-economic inequality has made many Americans anxious about the status of egalitarianism, a continuing ultimate value in U.S. society.

Language Change and Sociocultural Evolution

The work briefly reviewed above examines very fine-grained linguistic changes motivated by ideological processes in local speech communities. However, linkages between more general tendencies of language change and cultural change have often been proposed. Widely accepted through the early 20th century was the theory that human language exhibited a hierarchy of evolutionary grades, from ‘primitive’ to ‘civilized,’ that correlated with the grades of the theory of cultural evolution. While linguists today almost universally reject such ideas, evolutionary thinking continues to have a place in theories of the relationship between language change and culture change, and deserves brief attention.

Certain limited features of human languages may be loosely correlated with subsistence type and social complexity. These include plant and animal terminologies. For instance, Brown (1984) argued that the number of life-form terms for plants (*tree*, *bush*, *herb*, *grass*, *vine*, etc.) is correlated with increasing social complexity. Brown also suggested that cultivators have many more folk generic terms for plants than do hunter-gatherers, and also use more binomial species labels. While other studies have supported these results (e.g., Balée, 1994), they should be interpreted with caution. Balée has pointed out that the difference in the number of generics for plants between cultivators who speak Ka’apor (Urubú-Kaapor) and hunter-gatherers who speak Guajá, another Tupi-Guaraní language closely related to Ka’apor, is due partly to the fact that the Ka’apor simply have more uses for plants; they use implements made from plants to process other plants, and their sedentism permits an elaborate material culture. Furthermore, Hunn (2001) has pointed out that in Oaxaca, vernacular speakers of Spanish, an expanding world language, have far simpler repertoires of

biosystematic terminology than do speakers of small local Zapotecan languages, in spite of the fact that Spanish has been spoken in the area for 500 years. Berlin and Kay (1969) held that elaboration of color terminologies was correlated with level of sociocultural evolution. But MacLaury (1991) showed in a study of Mayan-language speakers in Chiapas that the elaboration of color terminology could exhibit vast differences among speakers of a single language, and seemed to depend more on the specific life circumstances of individuals, especially on how much people were forced to engage with novelty, than on any broad correlation between language and sociocultural evolution. Thus terminological elaboration in the biosystematic and color lexicons appears to be largely correlated with the elaboration of attention and use, a matter that is not surprising in any way and that can be accounted for within Silverstein’s model outlined above, without appeal to evolution theory.

The concept of natural selection, taken from Darwinian theory, has been invoked by modern linguists to account for the relationship between language change and cultural change. Hymes (1968) suggested that the current reduction of world linguistic diversity, caused by the expansion of ‘world’ languages at the expense of ‘full’ languages, results from a selective process in which world languages are better adapted to certain emerging communicative functions, and thus replace full languages. Croft (2000) and Mufwene (2001) have suggested that linguistic elements within inherently variable assemblages (which Mufwene has characterized as ‘Lamarckian species’) – phonetic realizations, construction types, semantic features, and the like – can be seen, like genetic alleles, as targets of natural selection. Cultural context, among other variables, yields selective pressures, and the relative frequency of particular realizations of linguistic elements will reflect these. The development of Haitian Creole (Haitian Creole French) from French has been treated within this model. During the early ‘settler’ period, when slaves lived intimately with their French masters on small landholdings, they acquired a version of vernacular French that, while it was a second language, was not greatly dissimilar from the French spoken by the native speakers from whom they learned it. The shift to plantation agriculture, however, swamped out these early second-language varieties of French. Increasingly large populations of newly imported African slaves had less and less access to French models. Themselves learning the language from other second-language speakers, they favored the least marked French constructions and constructions derived from African sources over the

varieties used by the earlier African settlers of Haiti. This process yielded the basilectal creole varieties attested in Haiti today. Thus, the context for selection that favored basilectal structures was a cultural system: plantation agriculture, with its huge slave work forces supervised by relatively few – and interactionally remote or absent – French-speaking overseers.

Advocates of the selectionist view have neglected the complex mediations between cultural and linguistic systems that must underlie the emergence of a system such as Haitian Creole, and that are treated in the semiotic theory of Silverstein and others cited above. Constraints on the acquisition of second-language features do not consist solely of the opportunity for learners to observe native-speaker models, and such opportunity is not determined in any simple way by mode of subsistence or labor organization. Instead, these opportunities and what learners make of them are mediated by ideological systems. For instance, in the Haitian Creole case European French speakers almost certainly found that the shift toward basilectal varieties was entirely consistent with their understanding of Africans as unintelligent and unable to master refined European speech. With such an understanding – a convenient one when the labor regime involved starving and torturing these Africans – the ‘disorderly’ grammar and ‘impoverished’ lexicon of the slaves would be merely natural, would invite no intervention, and might even be encouraged. Deviations from this ‘iconization’ would, in Gal and Irvine’s (1995) terms, be ‘erased,’ and pass unnoticed or be dismissed as aberrant or suppressed as dangerous. At the same time, among Africans, basilectal varieties could become icons of their own world, symbols of resistance to and differentiation from their French-speaking oppressors. An approach restricted to the terms of the theory of natural selection does not invite investigation of the semiotic dynamic by which these ideological systems – which are well documented – resonated with the emerging basilectal structures.

The development of modern Mexicano in the state of Tlaxcala, Mexico shows clearly that simple demographic facts cannot account for language change in a contact system. Mexicano is the descendant of Tlaxcalan Nahuatl (Náhuatl Central), one of the Nahuatl (Aztec) languages of the Uto-Aztecan family. Mexicano has incorporated very large amounts of Spanish loan vocabulary, across nearly every sub-component of the lexicon from nouns for European cultural elements such as horses and chickens to discourse particles, prepositions, and derivational morphemes. The Mexicano case is the reverse of the Haitian Creole case: over a few hundred years,

immigration from Europe reduced Nahuatl-speaking communities to islands in a Spanish-speaking sea. However, the rate of incorporation of Spanish loan elements into Mexicano cannot be correlated directly with the ratio of Nahuatl speakers to Spanish speakers. Instead, it is closely linked to genre. Spanish loan words can convey an elevated or serious tone, and so large numbers of Spanish constructions appear even in the 16th century, at a time when Nahuatl speakers were emphatically the majority in central Mexico and very few people were bilingual, in such genres as the minutes of the proceedings of town councils and notarial records such as wills. Bilinguals today can adjust the frequency of Spanish versus Nahuatl roots even in spontaneous speech. They express thereby subtle variations in stance and attitude that are associated with diverse social positions, age cohorts, and genders within a larger ideological system that contrasts nativistic Nahuatl purism and the expression of community solidarity with an ideology that, by iconization, links Spanish to the power of its first-language speakers.

Language Spread and Language Shift

Cultural mediation appears to play a role in language spread and language shift. The archaeologists Colin Renfrew and Peter Bellwood (2002) hypothesized that large multibranched language families such as Indo-European or Niger-Congo-Kordofanian almost all descend from languages spoken by primary cultivators at the time of the initial domestication of animals and cultivated plants. In contrast, small language families such as Wakashan or North Caucasian are the residue of a more linguistically diverse pre-Neolithic epoch. Renfrew and Bellwood argued that the principal mechanism of language spread throughout most of human history was not the language shift that is so obvious in the history of the last 500 years, but the expansion and spread of populations of speakers of the languages ancestral to the large families. Since demographic factors favor the increase of populations of cultivators over populations of hunter-gatherers, Renfrew and Bellwood predicted that the languages of the latter will be found only in relic zones where the Neolithic expansions of cultivator populations did not reach.

One difficulty with this very general model is that there are attested cases of ancient language shift. For instance, two of the major language families of the Americas, Athabaskan and Algonquian, are spoken largely by hunter-gatherer populations which obviously expanded without shifting to cultivation. Some of the descendant languages (such as California Athabaskan, Denaina in southwest Alaska, and the

Algonquian descendant language Cree-Montagnais [Montagnais] in the Canadian subarctic) exhibit incongruent elements that must represent the influence of speakers of a substratum language who adopted the expanding Athabaskan or Algonquian variety (Kari, 1989; Golla, 2000). The Australian linguists Nicholas Evans and Patrick McConvell (Evans and McConvell, 1998; McConvell, 2001) have proposed that hunter-gatherers who survive climatic instability in continental interiors must be able to accomplish not only movements into uninhabited territories, but retreats into populated regions. The latter type of move requires the cultural capacity – Evans and McConvell call it ‘charisma’ – to incorporate populations thus encountered into the social, ritual, and linguistic systems of the retreating group. Such movements are attested by apparent substratum linguistic elements not only in the Americas, but in the Australian materials which Evans and McConvell originally investigated. Evans and McConvell’s work suggests that a set of ideas about language must be as much a part of successful hunter-gatherer adaptations as is nature knowledge and technological capacity.

Nichols (1992) suggested that the likelihood of language shift is conditioned by human ecology. She proposed a distinction between linguistic ‘accretion zones’ (sometimes called ‘residual zones’) and linguistic ‘spread zones.’ The former tend to form in micro-environmentally complex coastal and montane zones, and are characterized by very large numbers of languages, large numbers of small language families, and high levels of multilingualism. Indigenous New Guinea, aboriginal California, and the Caucasus mountains are examples of accretion zones. Nichols argued that the languages of accretion zones are relatively stable and thus are likely to harbor archaic features. ‘Spread zones’ tend to form in continental interiors and are characterized by relatively small numbers of languages and language families, and the formation of *lingua francas*. Languages in spread zones are more likely to be innovative and fail to preserve archaic features. The Eurasian steppes, the Congo basin, and the North American subarctic are examples of spread zones. Language shift, to spreading languages, is much more likely in spread zones than in accretion zones. At the root of this distinction is probably the differential cultural adaptations of humans to the two different types of environment. In the intricate mesh of relatively stable micro-environments in accretion zones such as aboriginal California or the Caucasus, cultural systems that favor local differentiation and specialization, mediated by various forms of cultural exchange, tend to be associated with linguistic ideologies that favor multilingualism over language shift. Local ways of

speaking become markers of privileged access to local resources, but speakers become multilingual to manage exchange relationships. In contrast, in spread zones a combination of relative environmental instability and large-scale homogeneity of human adaptive strategies may favor distribution of risk over large geographical regions. This is best accomplished on the linguistic side through the relative homogeneity of a spreading language. A dramatic example of this type is the spread of Shoshoni across the Great Basin of North America. Shoshoni language ideology favors inattention to dialect variation, this inattention being accompanied by an unusually high level of mobility of bands and family groups, and Shoshoni exhibits no clear linguistic isoglosses even though it is distributed over an extremely large area (Miller, 1970, 1971). It seems likely that this sociolinguistic picture is an old one in the community. However, language shift in accretion zones is attested, as with the language shift in California and coastal Alaska to California Athabaskan and Denaina respectively, with the superstratum Athabaskan communities being involved in an Evans and McConvell-type move into populated territory.

Hill (2000) proposed that different tendencies in the organization of language diversity between accretion zones and spread zones probably result from complex interactions between ecological adaptation, the social contexts of language acquisition, and language ideologies. When linguistic ideologies construct features of language as licensing access to resources, two directions in sociolinguistic stance by speakers are possible. The adoption of a ‘localist’ stance is exemplified by speakers of the Kokolo:di dialect of Tohono O’odham, who live in a relatively well-watered and productive region of the Sonoran desert. Their dialect is highly homogeneous and focused, and speakers are very resistant to, and self-conscious about, innovation. Speakers of the Gigimai dialect, on the other hand, who live in a region with sporadic and very low rainfall, exemplify a ‘distributed’ sociolinguistic stance. These speakers are relatively promiscuous adopters of all available linguistic resources. Hill suggested that localists understand their situation in relation to their language and their environment as entailing a statement like ‘I have a rightful and primary claim on valuable and dependable local resources that are necessary to my well-being, and the way I speak verifies my claim.’ In contrast, distributed speakers appear to believe that ‘I have no rightful and primary claim on valuable and dependable local resources adequate to sustain my well-being. However, I might be able to add to my limited primary claims secondary claims on

a sufficient range of a distributed inventory of resources to sustain my well-being. The way I speak verifies these secondary claims.’ Even in this case of the desert-dwelling Tohono O’odham, where historically water scarcity approached and sometimes passed limits on human survivability, the contrasting sociolinguistic stances are not strictly determined by environment, but by local cultural understandings of it and by a linguistic ideology that takes certain sociolinguistic stereotypes to license insider versus outsider status, and hence rights to resources. The Tohono O’odham do not live in the same desert that a biologist or a geologist might see, but construct ‘landscapes,’ culturalized environments in which resources become meaningful. Furthermore, unlike the desert-dwelling Western Shoshoni described by Miller (1970, 1971), the Tohono O’odham choose to notice dialect differences, construct these as sociolinguistic stereotypes, and use them to license rights. There are, however, ecological constraints that can rule out a localist stance. Localism, with its close adherence to relatively homogeneous ways of speaking, probably requires a period of focusing within childhood peer groups, and the local environment must provide enough in the way of relatively stable subsistence resources to permit the formation of such groups. Distributed-stance speakers of Tohono O’odham report that water and food scarcity required their families to make frequent moves, precluding the formation of stable peer groups. Among these speakers, even siblings may speak quite differently from one another. Miller (1970, 1971) reported absence of child peer groups for the Western Shoshoni as well. Childhood peer groups, or lack thereof, are not the only dimension of social organization that may shape language spread and shift. James and Leslie Milroy (1985) showed for urban contexts that sociolinguistic ‘focus,’ the relative homogeneity and stability of dialects, is related to the structure of social networks, which is in turn related to local impacts of political-economic systems. Relatively dense and closed networks, where people have many different kinds of relationship with others that remain relatively stable, favor strong focusing. In contrast, open networks, in which people often form new relationships, some of these involving so-called ‘weak ties’ – social ties that mediate only very limited kinds of interaction, such as commercial transactions – seem to favor the rapid spread of innovation and relative heterogeneity and instability in local ways of speaking.

Esoterogeny and Exoterogeny

Thurston (1987, 1989, 1992), based on work in Melanesia, suggested that types of structural drift in

language change may be associated with the localist and distributed stances outlined above. Very focused local varieties may undergo what Thurston called ‘esoterogeny,’ acquiring and conserving highly marked and unusual typological properties that are difficult to learn. In contrast, spreading languages are likely to be ‘exoteric,’ characterized at many loci of typological variation by relatively unmarked structures. An illustration of contrasting esoterogenic and exoterogenic processes of change can be drawn from the Uto-Aztecan languages. The ancestral Uto-Aztecan proto-language seems to have had at least a distinction between an unmarked nominative and a marked accusative case on nouns, and a set of argument-encoding clitics that distinguished nominative from accusative. The descendant Nahua languages, which have spread throughout central Mexico and into Central America as far south as El Salvador and Honduras and had millions of speakers (Náhuatl in Mexico still has at least one million speakers), retain only the latter feature and lack case marking on nouns. In contrast, Cupeño, spoken within the California accretion zone and perhaps the smallest Uto-Aztecan language, marks the accusative case on nouns and their modifiers, distinguishes nominative from accusative case in a set of pronominal prefixes, has added the additional elaboration of a set of person-number clitics that distinguish an ergative agent from an absolutive subject, and distinguishes the absolutive objects of imperative verbs from accusative-marked objects of verbs in nonimperative moods.

One of the most famous examples of esoterogeny is the Amazonian language isolate Pirahã (Múra-Pirahã), spoken by about 150 people. Everett (2004b), the major contemporary scholar of the language, has commented that “the combination of a small phoneme inventory, which provides minimal contrast, complex morphology, tone and a few other features unique to Pirahã make this language very unusual and extremely difficult to learn.” The unusually small inventory of segments includes some otherwise unattested allophones, such as a bilabial trill allophone of /b/ and a double-flap allophone of /g/, in which the tongue tip first flaps on the alveolar ridge and then on the lower lip as the tongue actually comes out of the mouth. The stress rules of the language involve an unprecedentedly complex interaction between rightward alignment and four distinct syllable weights, which are shaped partly by the voicing of the onset consonant rather than the weight of the nucleus (there are no coda consonants). Such ‘esoteric’ features are almost certainly propped up by local ideologies that have made them meaningful as identity markers. This is the case with Pirahã. In contrast

with their close linguistic relatives, former speakers of Mura who now speak only Portuguese, and in spite of ample contact with Portuguese speakers over 200 years, the Pirahã are not bilingual, believing that speaking only their own language is essential to their identity as people who are 'straight' instead of 'crooked' (Everett, 2004a).

Culture and the Speed of Language Change

Historical linguists are very interested in the speed of language change, since methods of linguistic prehistory can retrieve deeper pasts when language change is slow. Thus, it would be useful to determine whether cultural factors can slow or accelerate language change. There is not time to treat this point in detail; a very useful discussion of factors that slow and accelerate cultural change itself can be found in Urban (2001). Therefore, I treat only two salient questions, the role of subsistence type and the role of media. In the case of subsistence type, it is often suggested that language change may be faster among hunter-gatherers than in more complex societies. However, the above discussion has insisted that susceptibility to innovation is mediated by much more complex factors. The distinction between accretion zones, where speakers tend to adopt localist stances, be relatively resistant to innovation, and display tendencies toward esoterogeny when they do innovate, versus spread zones, where speakers tend to adopt distributed stances and be relatively open to innovation which is likely to be exoteric, crosscuts the distributions of hunter-gatherers and cultivators. In accretion zones are found hunter-gatherers such as the Karuk of California, but also communities of small-scale horticulturalists such as those of highland New Guinea, and even literate state-level societies as in the Caucasus mountains. Spread-zone linguistic communities also include societies at every level of sociocultural evolution. Thus, no generalization about the speed of language change that refers simply to subsistence type or level of sociocultural complexity is likely to be useful.

Another argument frequently made about the interaction between sociocultural factors and rate of language change is the idea that the adoption of certain media will slow down or speed up the rate of innovation. In the case of writing, often suggested as a factor favoring conservatism, this is almost certainly wrong. This can be shown by the well-known contrast between two Germanic languages, Icelandic and English, both spoken in highly literate societies. Icelandic is a notorious case of conservatism, with today's speakers able to understand 800-year-old texts

with minimal assistance. In contrast, English of the same period is quite inaccessible to contemporary speakers, and must be studied as a foreign language, even though literacy has been quite widespread in England for nearly 500 years (Cressy, 1980). Recently developed media such as radio, television, and the Internet are often suggested as likely to favor accelerated innovation and the spread of languages spoken by early adopters of such media. The lesson of literacy, for which we have thousands of years of records in hundreds of languages, is that the interaction between media and language change is likely to be complexly mediated by ideology and by the details of local social organization and political economy.

Conclusion

The cases and controversies about the relationship between language change and cultural change reviewed above lead historical linguists to conclude that the two processes seem often to be connected. However, these connections seem to be irrevocably local and historical rather than general and evolutionary. Tendencies – such as the loose association between accretion zones, localist sociolinguistic stances, and esoterogeny versus spread zones, distributed sociolinguistic stances, and exoterogeny – can indeed be identified and are useful in pointing toward possibilities. But exceptions are common, and evolutionary accounts of local situations are likely to be unsatisfactory. Instead, the understanding of these relationships is a historical-linguistic project. Such a project requires detailed historicist untangling of the interaction between local cultural construal of resources, rights, and persons and the ways that local details of drift in language change are linked to these by language ideologies.

Language Education for Endangered Languages

L Grenoble, Dartmouth College, Hanover, NH, USA

© 2006 Elsevier Ltd. All rights reserved.

As local communities become more aware of the potentially imminent loss of their languages, they have begun to undertake measures to foster education in them. There is currently a wide range of programs which have been adopted to arrest language loss and to help children and adults take control of learning their language. These can loosely be divided into school-based and community-based programs.

School-Based Programs

When people think of education, they naturally think of school programs, and perhaps the majority of programs for endangered languages are based in schools. In many communities the school is seen as the primary vehicle for language education. Note that this is a radical shift from the way that children first learn their primary language, within the home and within a community of speakers. It is more reminiscent of the way that children typically learn foreign languages.

Total-Immersion Programs

Total-immersion programs work well when there is a sufficient speaker base to help insure their success. These programs tend to be multifaceted, with total-immersion language instruction in the schools reinforced by the sole use of the language in the home. Thus they are often most successful when fluent speakers can be found in all generations, as the source not only of teachers in the school, but also of parents who can speak the language in the home. A common goal of total-immersion programs is complete and fluent use of the target language in all domains. In a true total-immersion program, all of the school curriculum is taught in the endangered language and the language of wider communication is often taught as a secondary subject. Bi- or multilingualism is an ultimate goal, as in general, children enrolled in such programs ultimately need full use of both the endangered language and the language of wider communication.

The Language Nest Model

The language nest model is a particular type of immersion program. It was first used in the 1980s in New Zealand for the revitalization of the Maori language and is often referred to by its Maori name, *Te Kōhanga Reo*. It has subsequently also become closely associated with Hawaiian language

revitalization, which built its program on the *Te Kōhanga Reo* model but uses the Hawaiian name, *Pūnana Leo*. The language nests were initially created in regions where the only group of people speaking the language was, by and large, the grandparent generation; the parents and children tend to be monolingual in the language of wider communication. The language nest model takes preschool children and places them in 'nests' where the endangered language is spoken. Parents are generally expected to make the commitment to learning the language and using it in the home to reinforce what is learned at school. Historically, as each lead class graduated and went on to a higher level, first in preschool, then elementary and secondary school, new nesting classes were created so that children ultimately received all of their education in the target language.

The creation of domains of language use outside of the schools has proven to be a challenge for language nest programs, in large part because the speaker base is primarily second-language speakers who do not attain full fluency in the endangered language.

Partial-Immersion Programs

For languages with relatively few remaining speakers or with a lower level of community commitment, it is often not realistic to implement a full-fledged immersion program. Partial-immersion programs exist in many schools, where the curriculum is taught primarily in the language of wider communication and the endangered language is taught in specially focused classes. There are two basic types of partial-immersion programs. In the one, the less common, some subjects are taught in the endangered language. Such subjects are typically the culture and/or history of the people. The benefits here are that learners acquire the language in culturally appropriate settings using the specific lexicon. Thus a Native American class on oral traditions or crafts could be conducted in the indigenous language. In the other, the endangered language is taught as a secondary subject. The advantages to this model are obvious: it requires a smaller commitment of time and resources. Moreover, children coming to these programs often do not know the endangered language, and so need to learn it from the beginning. The primary disadvantage is that the endangered language is allotted secondary status within the schools and is taught more as a foreign language than as a primary language. Thus it does not achieve the full range of uses of the language of wider communication and cannot supplant it. Although such programs may be designed with the ultimate goal of stable bilingualism, they rarely

achieve it, since they do not achieve full fluency in the endangered language.

Outside of the Schools

The dichotomy between school-based programs and others is somewhat artificial, as often two different types of programs are used in conjunction with each other. For example, many of the total-immersion school programs require the parents to learn the language and use it in the home to reinforce the work that is done in the schools. While school-based programs are almost exclusively built on Western models which require literacy in the endangered language, programs outside of the schools often dispense with literacy as too time-consuming and cumbersome for learning to communicate orally.

Community-Based Programs

Community-based programs are grassroots movements, stemming from and sustained by community leadership and commitment to language education. Such programs vary greatly in nature, but often have in common that they bring together a variety of community members for language practice. Maori communities in New Zealand organize weeklong or weekendlong immersion events for community members of all ages; people come together with the commitment to speak nothing but Maori for the time of the event. Other communities have established similar immersion events, or schedule regular meetings for language practice. These group meetings often link the practice of native crafts and traditions with language use. They have the advantage of offering options to adult learners who may not be able to attend regular classes. Beyond creating opportunities for language use and immersion, such programs organize language festivals, feature plays, songs, and poems, and actively promote the use of language in conjunction with traditional activities.

Some programs have made the decision to start teaching the endangered language to adults, not children. The rationale behind the decision is that it is the adults who will then use the language and teach it to the children, as is the norm for first-language acquisition. UNESCO, for example, advocates adult literacy first, with an emphasis on the acquisition of the practical skills needed for functioning in the modern workplace.

Master–Apprentice Program One very successful program for language groups with few remaining speakers is the master–apprentice program. Initiated in California in 1992 for teaching languages on the verge of extinction, its basic principles can be adopted

to the teaching of endangered languages anywhere. The program matches an ‘apprentice’ learner with a ‘master’ of the language whose job is to teach the language by using it in everyday life. The program is based on the following principles: (1) the use of English is not permitted in interactions between master and apprentice; (2) the apprentice needs to be a full participant in determining the content of the program and assuring use of the target language; (3) oral, not written, language use is always primary in learning and communicating; (4) learning occurs not in the classroom, but in real-life situations, engaging in real-life activities (e.g., cooking, gardening, etc.); and (5) comprehension will come to the beginning language learner through the activity, in conjunction with nonverbal communication. These principles are designed to insure that language learning and instruction take place in an immersion setting that nearly replicates the ‘natural’ language-learning environment of children (as opposed to artificial classroom settings, for example).

Beyond the inherent incentive to learn and to teach one’s language, in the Californian program a modest stipend is provided for up to 3 years of work between the master and the apprentice. After this period the graduate apprentices should be prepared to continue their education with the masters, but also to serve as teachers themselves.

Training before beginning the team work is critical. The language masters are primarily tribal elders who may not have actively used their language for many years, due to the very factors which have led to language attrition. In addition, they are not trained language teachers and many have never taught their language. Thus initial training sessions are designed to provide the opportunity for masters to become accustomed to speaking their languages again and to introduce the basic principles of language immersion instruction, such as building and practicing vocabulary, and enforcing the importance of repetition, review, and patience in language learning. Important components of the training include getting the participants used to nonverbal communication, teaching apprentices key phrases and questions in the target language, and some cross-cultural comparison of the different ways language is used in different cultures. Despite the many linguistic and cultural differences, there is a commonality of experience which makes it very useful for all teams, from beginning to advanced, to come together for this training.

By the end of the first year, apprentices should be able to ask and answer simple questions about themselves, describe pictures, use some culture-specific language (prayers, stories, etc.), and recite a short speech prepared with the help of the master.

This basic repertoire is expanded in the second year, with the goals of being able to speak in simple grammatical sentences, being able to carry on extended conversations, having increased comprehension, being able to converse on most topics, and being able to give short speeches. Finally, by the end of the third year of the program, the apprentices should be able to converse at length, use long (and presumably complicated) sentences, and develop plans for teaching the language. These goals are at once realistic and ambitious: language learning is a slow process, and the apprentice meets with the teacher only for 10 hours per week. One can predict that the learner's motivation will be very high in this program and will have a positive impact on learning. The results of the program vary among individual students depending on a range of factors, such as the overall time commitment, how much the apprentice is truly immersed in the language, and so on.

Potential Difficulties

Despite the many differences between these various educational models and the particularities of individual endangerment situations, they similarly face a number of potential difficulties. These include a lack of qualified teachers, as often speakers are elderly and untrained as teachers, while younger, trained teachers lack proficiency in the language. Lack of pedagogical materials and other basic resources (such as dictionaries) often hamper programs. At a more profound level, a lack of consensus about how the language is to be spoken and how it is to be written, with disagreements frequently centering around issues of orthography and codification, who has the right to teach it, have put an end to many potential programs.

Access to the media is often difficult to impossible for endangered languages.

Legislation at local and national levels can either aid or impede endangered-language education. Policies which promote multilingualism and allocate resources to support educational programs can have favorable effects, while more monolingual policies which require testing or use of a single national language can have a negative impact which is difficult for a local community to overcome.

Language Education: Language Awareness

P Garrett, Cardiff University, Cardiff, Wales, UK

© 2006 Elsevier Ltd. All rights reserved.

The constitution of the Association for Language Awareness (ALA) defines LA as 'explicit knowledge about language and conscious perception and sensitivity in language learning, language teaching and language use.' Hence, LA has always extended into many areas, including translation (Bowker, 1999) and literature (Carter, 1999). Here we focus, first, on what is normally regarded as 'grassroots' and 'classroom' LA, centered on language learning

and teaching, and, second, on pertinent broader social and applied contexts of language use, social attitudes, etc., and on some of the implications of globalization.

LA is generally seen as emerging in the 1970s, in the writings of Halliday (1971), and with the recommendations of the Bullock Report (DES, 1975) in the United Kingdom, drawing attention to underachievement in L2s in British schools. Some more enterprising teachers were soon independently establishing local projects to increase pupils' knowledge of languages and language. Cameron (1993) refers to three types of LA program at this time:

for pupils about to start L2 learning, for pupils in multilingual/multicultural classrooms, and as prelinguistics courses for pupils in higher classes. The National Council for Language in Education (NCLE) working parties (1978) and conferences (1981, 1985) brought valuable institutional support to these grass-roots initiatives, and Hawkins (e.g., 1984) added an enduring theoretical framework, with proposals for LA as a 'bridge' between mother tongue L1 and L2 education, and between primary and secondary education, and also with broader social objectives, such as parenting. Further impetus came in 1989 with a British Association for Applied Linguistics Seminar on LA (an event organized to bring together language practitioners using the term for different purposes in a range of contexts), and in 1992 with the First International Conference on LA, at which the ALA and its journal *Language Awareness* were launched. ALA conferences have followed biennially at venues in the United Kingdom and overseas (to date, Canada, Ireland, Sweden, France, and Spain).

LA often has been identified with the United Kingdom, as above, but equivalent projects are increasingly found elsewhere. EU-funded projects involving networks across several countries have been particularly impressive – for example, the primary-school focused Evlang – 'l'éveil aux langues' project (Candelier, 1998). Labels used to translate LA have occasionally aroused debate, as they can carry subtle distinctions, even within a single context (e.g., Gnutzmann's [1997] list of German terms). Related English terms include *consciousness-raising* (CR) and *Knowledge about Language* (KAL). James (1996) proposes reserving CR for the identification of discrepancies between present knowledge and target knowledge, and employing LA for the metacognition of knowledge that one already possesses without previously realizing one had it. KAL has been employed in some U.K. government reports. Cameron (1993) points to the different origins of KAL and LA, and the confusion arising from assuming synonymy. These two terms in particular reflect the LA debate around the role of explicit learning and explicit knowledge in language learning.

LA is associated with discovery-focused pedagogy. Often, learners engage in small-scale investigations requiring reflection or talk about how languages work, how they are learnt, and how they themselves can best focus their own learning. Hence, the development of metalanguage (e.g., Jaworski *et al.*, 2004; Berry, 2005), awareness of strategies of learning and communication, critical evaluation of the process of language learning (e.g., Garrett and Shortall, 2002), and working toward more autonomy in learning and use (Little, 1997) also feature. Reflective approaches

are extended to language teacher education (e.g., Wright and Bolitho, 1993; Walsh, 2003), and also teacher development. Hence, projects bridging 'the space between' English and Modern Foreign Language teachers have involved the teachers sharing reflections on their different perspectives and experiences (Pomphrey and Moger, 1999; Turner and Turvey, 2002).

Benefits attributed to LA are viewed across five broad and overlapping dimensions: performance, cognitive, affective, social, and power (James and Garrett, 1991). The performance dimension concerns whether knowledge gained from greater awareness of language facilitates improved language use and learning. The cognitive dimension relates LA to an 'awareness of pattern, contrast, system, units, categories, rules of language' (Donmall, 1985: 7), and to the development of an 'analytic competence' that extends beyond language learning: a role Hawkins (1984) suggests might earlier have been fulfilled by learning Latin. The affective dimension is usually considered in terms of attitudes, motivation and curiosity accruing from LA. Hawkins's proposal for LA as a bridging subject to address poor achievement is directed as much at this dimension as the performance one. The social dimension is generally seen in terms of social harmonization in contexts of language diversity, and of building better relations between ethnic groups. The power dimension aims at increased sensitivity and empowerment to counter the manipulative and oppressive use of language, and to understand and counter language ideology. LA work with its prime focus on this dimension is usually referred to as Critical LA (Fairclough, 1999). It will be clear that the success or failure of LA work, in terms of both short-term and more enduring impacts, needs to be judged on these dimensions. We now turn to consider LA in the wider social context, where the last three dimensions in particular feature strongly.

Although some LA projects in schools aim at changing attitudes toward languages and their speakers, other work has studied the broader social backdrop of attitudes and stereotypes itself. Whereas some of this survey work has drawn its data from teachers and students (e.g., Garrett *et al.*, 2003, in Wales; Lochman *et al.*, 2004, in Brussels), other work has studied the views of nonlinguists generally, arguing (*inter alia*) '... the undeniable importance it has in the language professional's interaction with the public' (Preston, 1996: 72). LA-relevant work also has focused on specific contemporary issues in which language and communication can play a crucial role, from designing teaching programs to counter physician-patient communication barriers in HIV/AIDS medical interviews (Singy and Guex, 1997), and

(to extend LA to communication and discourse awareness) understanding the communication complexities of HIV/AIDS campaigns (e.g., Perloff, 2001), to attitudinal studies of ageism in communication, and of 'good communication' between generations (e.g., Williams *et al.*, 2004).

Cameron (2000) has linked this general contemporary concern with 'good communication' with processes of globalization, which is increasingly referred to in other recent LA work. Some concerns itself with the increasing mobility of large numbers of people and the impact on language choice and use, the values attached to them, and social identities, whether they are tourists (Jaworski *et al.*, 2003), or recently immigrated communities (Yelenevskaya and Fialkova, 2003, in Israel) or their children who have grown up in the new community (Jørgensen and Quist, 2001, in Denmark), or people returning to visit locations of earlier family generations (Wray *et al.*, 2003, in Wales). Other work has explored the implications of the claim that, with the weakening of traditional social distinctions of class, sex, and age under globalization, traditional language situations and notions of standard language varieties have come under attack. Kristiansen (2001), for example, finds attitudinal evidence of a splitting in two of Standard Danish, with a standard emerging for the media that differs from that valued in the educational system. But globalization also is viewed in terms of the commodification of discourse, the increasing marketization in our lives and institutions, including education, and of how our increasingly knowledge-based societies impact not only on our jobs but also on our personal relationships and identities across the lifespan. LA has a challenging role to play in such globalization processes, to better prepare us for pursuing our social identities, and for resisting organizational incursions into our everyday lives. To this end, Fairclough (1999) has argued the importance of promoting educational programs in critical discourse awareness.

Language in Computer-Mediated Communication

N Baym, University of Kansas, Lawrence, KS, USA

© 2006 Elsevier Ltd. All rights reserved.

Before computers were networked, the terms 'language' and 'computer' only occurred together in describing programming code. In recent years, however, the Internet and related technologies have become popular and pervasive media for human communication. Since the late 1970s (e.g., Hiltz and Turoff, 1978), questions of how human language is used in these media have become important concerns for linguists, communication scholars, sociologists, and researchers from other disciplines. This article begins by describing the primary forms of computer-mediated communication (CMC), as well as the characteristics that differentiate these media from one another. It then addresses the primary issues that have dominated the discussions of computer-mediated language. A brief caveat is in order. The Internet changes so rapidly that the forms of CMC available, and the ways in they are used and by whom, evolve more quickly than print forms such as this article can accommodate. By the time this article reaches its readers, new forms may well have emerged.

Characteristics of Computer Language Media

In the simplest sense, CMC can be distinguished on the basis of whether it occurs in real-time

(synchronous CMC) or whether there is a time delay between messages (asynchronous CMC). With synchronous forms, participants type messages that appear on others' screens as soon as they are sent. Readers reply instantly, leading to a rapid exchange of brief messages. Chat rooms, where multiple people gather on the basis of shared interests, are one form of synchronous CMC, as is instant messaging, which usually occurs between two people. Synchronous CMC is also found in richly visual graphical online games (including multi-player role-playing games in which people play together to achieve goals such as gaining treasure or slaying mythical monsters) and as an accompaniment to online versions of traditional games such as poker, dominoes, and backgammon. Multi-user domains, or MUDS, are textual online 'spaces' designed for functions as varied as role-playing, generalized socializing, and education. Like other synchronous forms of CMC, users of a MUD interact in real time if they are online simultaneously and are in the same 'room' or area of virtual space.

The most popular forms of CMC are asynchronous. Email, the electronic equivalent of letters, may be person-to-person, or may be group communication organized through mailing lists based on interest, family, friendship, work, or other ties. Websites are also asynchronous, with static information posted for readers. On weblogs (or 'blogs'), a writer or collective of writers posts comments on a daily or even hourly basis. Readers can often engage in discussion of those comments through hyperlinked sections that appear

as second pages. Webboards, bulletin boards, and newsgroups are asynchronous forms of topical discussion in which large groups of users may gather on their own time to read and leave messages. Though the distinction based on synchronicity is common, in practice the lines between the two may blur. If people are online simultaneously and checking often, email can function in a near synchronous manner. Short message services (SMS), also known as text messaging, send very brief messages through mobile phones in exchanges that can happen quickly enough to be considered synchronous or with enough lag between turns to render them asynchronous.

Computer-mediated language can also be characterized by a set of other features that can influence interaction. These characteristics have also proven helpful for thinking about how forms of CMC differ from one another and how they compare to other forms of language use such as face-to-face communication (the usual standard for comparison in CMC research), telephone calls, and traditional letters (see the discussion of oral and written language below). In contrast to most other media forms, CMC can be either one-to-one or one-to-many. Email, instant messaging, and SMS are usually directed at single users, while mailing lists, chat rooms, and discussion boards are usually written for a broad and often semi-anonymous audience. The ability for each Internet user to communicate one-to-many is an unprecedented transformation in the landscape of communication media, which have historically limited this capacity to a small number of influential mass media producers.

Forms of computer-mediated language media also vary in the degree of interactivity, or ability to respond to messages, that they offer. Email and instant messaging are highly interactive, as messages are generally meant to invoke responses (one-to-many email as occurs on mailing lists and with spam is an exception). Websites, on the other hand, may not offer any means for readers to respond to their contents. A single form, such as the weblog, may vary in the degree of interactivity it offers depending on whether the author includes the means for readers to leave comments or reply to those comments that are left.

In strong contrast to face-to-face interaction and to a lesser extent the telephone, computer-mediated language media seem to transcend space. There are many locations where Internet access is difficult or impossible, which affects which languages are common online (more on this below). However, so long as people are online, messages exchanged across continents are indistinguishable from those sent between rooms in the same building, both in form and speed of

transmission. This can create a sense of being close to one another. Since sending messages via computer is generally less expensive than using long distance telephone (let alone travel), computer mediation can greatly increase the opportunities people have to use language with those far away.

By virtue of being electronic, computer-mediated language can be stored and replicated. Although forms of CMC vary in how ephemeral they may feel, most, if not all, are replicated as they are transmitted and stored on servers and backups. Most forms of CMC can be copied and sent on to others. Even messages sent person-to-person can be retrieved and replicated for other individuals or large audiences. This was the case when all email sent at the failed corporation Enron was posted to the World Wide Web as part of court proceedings. Chat and instant messaging seem to pass as soon as they occur, yet they can be logged. However, despite the inherent replicability and storage potential of computer-mediated language, storing and archiving examples of online language use has proven to be a difficult logistical challenge that has become a source of particular concern for librarians and information scientists. Computer-mediated language sites that are present one day may be gone or transformed the next.

Some forms of online language are more hypertextual than others. In hypertextual CMC, exemplified by websites, particular words or phrases on one page are linked to other pages with more information. Clicking on the hyperlink allows users to follow up on those bits that interest them most. In contrast to more linear forms of CMC such as chat, gaming, and instant messaging, in hypertextual CMC, information is connected through multiple possible relationships, giving readers the choice of what to pursue and allowing different readers of the same text potentially very different reading experiences. Email, which was once linear, has become more hypertextual as the ability to embed clickable links within messages has become common.

Finally, CMC media differ in richness (Daft and Lengel, 1984), or the extent to which nonverbal cues are apparent. In its early days, all forms of CMC were extremely lean, as all messages were restricted to the same monochrome font in the limited ASCII character set. The ability to format messages by varying fonts and colors and embedding images and sounds has made many forms of CMC, especially websites and graphic interfaces, richer. When CMC is lean, as it often is in more text-based forms, the reduction of physical appearance cues, along with the evidence of status and attractiveness they bear, can create a kind of invisibility or anonymity. Leanness

also positions language as the sole means of creating social context among interactants.

With this background, the article now turns to key issues that have dominated the research on computer-mediated language. These include the primacy of English versus other languages, comparisons between CMC and speech and writing, online playfulness, hostility, and the influence of gender on online language use. The essay concludes with a consideration of the influence online language use is likely to have on offline language.

Languages Used in Computer-Mediated Communication

Measuring the use of any particular language in online communication is challenging given the variety of forms of CMC and their varying accessibility. Efforts to ascertain language use have usually estimated the proportion of Internet users who speak a given language. English emerges as the most-used language on computer networks, although the proportion of English speakers relative to those who speak other languages on the Internet has fallen considerably since the late 1990s. The business *Translate to Success* has compiled data from varied surveys of Internet users to estimate that in 2004, 38.3% of Internet users spoke English. Chinese, Japanese, and Korean are also popular, constituting 11.2%, 10%, and 4.1%, respectively. The most common European languages are German (6.8%), Spanish (5.5%), Italian (3.9%), French (3.5%), Portuguese (3.1%), Russian (3%), and Dutch (2%). Only 1% of the world's Internet users speak Arabic. Fewer than 0.1% speak any African language. An effort to conduct a language census of weblogs (blogcensus.net) has resulted in the indexing of over two million blogs. More than half of these are in English, followed in dramatically smaller numbers by those in French, Portuguese, and Farsi (each of which occurred in between 10 000 and 90 000 blogs). Polish, German, Spanish, and Italian are the only other languages found in more than 10 000 blogs each.

That language use on the Internet maps so poorly onto language use in the global population reflects the wealth required to incorporate computer-technology into a populace, as well as historical and governmental constraints on the implementation of the technology in given cultures. Furthermore, in some nations, such as India, English may be the language used to access the Internet, even if it is not the primary language spoken by the majority of its citizens. The overrepresentation of languages used in wealthy countries, especially English, has often given rise to a sentiment that the Internet represents a further

colonization of poor nations by those with greater wealth, particularly the United States.

The use of a given language on the Internet is also affected by the technology itself. Until recently, online writing was restricted to the ASCII character set, which is designed exclusively for the Latin alphabet. With the advent of Unicode, people can now write with other alphabets; however, this technology is neither available to nor used by all. The result has sometimes been considered a form of "typographical imperialism" (Herring and Danet, 2004) with potential social, political, economic, and linguistic consequences. For instance, Greece has seen recent controversy surrounding what is called *Greeklisch*, an online version of written Greek in which the Latin alphabet is used to transliterate (Koutsogiannis and Mitsihopoulou, 2004). While some Greeks, particularly the young, view this as a means of participating in the global discourse of the Internet, others view it as a threat to the integrity and history of the Greek language.

Writing, Speaking, and Hybridity

Scholars striving to describe the linguistics of CMC have often done so by comparing online interaction to face-to-face communication and writing. Although in earlier work, the comparison presupposed an erroneous assumption that all computer-mediated language was the same, other scholars have limited their comparisons to particular forms of CMC. Biber (1986), Chafe (1982), and Mulkay (1985, 1986) are among those who have compared oral and written language. In general, scholars examining diverse forms of CMC in a number of languages (particularly English, French, Swedish, and Norwegian) have found that CMC resembles both written language and oral conversation (Baron, 2000; Baron and Ling, 2003; Baym, 1996; Danet, 1997; Ferrera *et al.*, 1991; Hård af Segerstad, 2005; Herring, 2001; Ling, 2005). CMC is like writing in many ways. The text usually bears an address. Messages can be edited prior to transmission. The author and reader are usually geographically (and often temporally) separated, messages can often be read by anonymous readers who may not respond. It is not possible for interlocutors to overlap one another nor to interrupt. Context must be created through the prose so that messages are often explicit and complete. There is rarely an assumption of shared physical context. Messages are replicable and can be stored. Vocabulary, syntax, spelling, and the use of uncontracted forms may make online interaction more like writing than speech.

On the other hand, there are many ways in which online language better resembles speech. Messages

are generally related to prior ones, often through turn-taking, although disrupted turn adjacency and lack of feedback can render turn-taking challenging (Herring, 2001). Messages are based in a relationship between writer and reader. There is often a history of shared referents and speech conventions (e.g., Hymes, 1986). The audience is usually able to respond and often does so quickly, resulting in reformulations of original messages. Topics change rapidly. The discourse often feels ephemeral, and often is not stored by recipients despite the capacity for storage. Furthermore, online language can be marked by colloquial and nonstandard spellings that foreground phonetic qualities (e.g., 'gotta' instead of 'have to').

Ultimately, many scholars conclude that online language is an "interactive written register" (Ferrera *et al.*, 1991), hybrid (Danet, 1997), creole (Baron, 1998), or "uncooked linguistic stew" (Baron and Ling, 2003) that blends elements of written and oral language with features that are distinctive to this medium, or at least more common online than in any other language medium. Among the most commented upon features of online writing are the use of abbreviation (e.g., TTYL for 'talk to you later'), the use of asterisks as brackets to simulate underlines, and upper case lettering to indicate emphasis. A number of deletions have also been noted, including the deletion of subject pronouns (e.g., 'gotta go now'), vowels, and punctuation. In SMS, spaces may be deleted as well, and there may not be any adjectives or adverbs (Hård af Segerstad, 2005; Ling, 2005). Messages in instant messaging, chat, and SMS are considerably shorter than those in conversation, writing, or most other forms of CMC, and in some synchronous forms of CMC such as IM, utterances may be broken up across turns.

In addition to the variety of forms of CMC, the task of identifying distinguishing characteristics of CMC is further complicated by the fact that there are so many other factors that influence language use in any medium (Baron and Ling, 2003; Baym, 1995a; Herring, 2001). As Basso (1974) has noted, written language always depends on its cultural and social contexts, functions, and the relationship between writer and reader. Each of these factors is at play in determining the linguistic form of any single instance of computer-mediated language use. Furthermore, individuals have distinct personal styles. As seen below, gender also influences language style.

In group CMC contexts where many people hold discussion over long periods of time, group norms develop that influence language use. These may include distinctive words, such as 'whuggle,' a form of greeting documented by Cherny (1999) or 're,' a short form of 'hello again' used to greet for a second time in

an Internet Relay Chat channel (Werry, 1996). In some cases, groups develop entire genres of language use distinctive or tailored to their forum, such as humorous lists of 'unasked questions' in a soap opera discussion (Baym, 1995b). Stylistic standards of formality and politeness also emerge over time within particular groups.

Playfulness in Computer-Mediated Language

Some of the distinctive linguistic features found in CMC can be attributed to a desire to save keystrokes, especially features such as deletions in synchronous interaction. However, many of the phenomena that occur in online language are better described as playful than time-saving. A number of scholars, most notably Danet (2001), have noted the playfulness of CMC. Danet (2001) argues that the play found on CMC, especially in synchronous CMC, can be traced to several influences. Interactivity and instant feedback can lead to a sense of immersion that may facilitate play. The lack of clear authorities and formal governing structure of online spaces can promote playfulness. The legacy of hacker culture with its love of wordplay, puns, irony, flippancy, and play with typography and spelling is also an influence as hackers were early adaptors of the Internet. Finally, the anonymity of many online spaces can be conducive to play since the enhanced role of language in creating an identity offers participants greater latitude than normal in presenting a self. For instance, many forms of online interaction require as a starting point that interactants choose a nickname or screen name by which they will be known.

Other reasons for the playfulness of CMC may be a desire for spontaneity or to increase the socioemotional appeal of messages in this nonverbally impoverished medium. Many of the 'errors' that make online interaction more like speech than writing can be understood as efforts to create a friendly, informal, conversational tone, which in turn gives rise to further playfulness. Following Bauman (1975), Baym (1995b) argues that online language often serves as a mode of performance that strives to entertain, to enhance the appeal of the discourse, to build identities for the performers, and to foster friendly relationships among interactants.

Among the most common forms of linguistic play in CMC are the aforementioned acronyms. Often-used acronyms including BTW (by the way), IMHO (in my humble opinion), and many others are compiled into online dictionaries posted on the Web. In particular, CMC contexts, people often develop unique playful acronyms such as PVGD, used in a soap opera discussion group to explain why the

children in the fictional town of Pine Valley aged so rapidly (the GD stands for 'glandular disorder'), or YMMV for 'your mileage may vary' offered when sharing personal experience in an online discussion group for pregnant women. Creative acronyms may be used to substitute for nonverbal expressions, as in LOL for 'laughing out loud.' Language play can also be seen in the development of new words in online contexts. Spam (unwanted barrages of messages), flaming (hostility), and blogging (writing online diaries) are examples of such words that have made it out of the Internet into wider discourse. Many have noted how common humor is in online contexts (e.g., Baym, 1995b; Myers, 1987).

Online Hostility

In contrast to theories that CMC fosters a playful affiliative environment, there has long been speculation that because of its potential anonymity, or reduction of nonverbal cues, CMC would foster the use of more hostile language, or flaming. Early research (e.g., Kiesler *et al.*, 1984) argued that because the computer medium is lean, it creates an environment in which norms are suspended. As a consequence, there would be more swearing, insults, name calling, and expression of negative affect. This (error-filled) comment from a group discussion of the television show *Star Trek*, is a typical flame: "Will you stupid jerks get a real life. Everyone with half a brain or more know that a human and a Klingon can not mate. The Klingon mating procedure would kill any human (except one with a brain like you). Stay off the net stoopid!" In group interactions, such messages usually lead to what has become known as a flame war. Such flame wars follow a fairly predictable pattern in which the original flame is followed by an equally hostile retort. The hostilities escalate, drawing in more participants. Other participants then chime in urging the original participants to move the discussion off-list or to ignore the hostilities. Eventually people lose interest and the discussion dies out. Many sources on the Internet can be found describing this pattern and offering 'netiquette' tips to prevent flame wars. Flaming is also concern in person-to-person interactions online. Fearing flaming, some organizations now require that some forms of communication, such as evaluations and reprimands, be conducted face-to-face rather than online in order to prevent inappropriate hostility.

One explanation of flaming is the reduced "social presence" (Short *et al.*, 1976) of other interactants given the leanness of the computer medium. Other scholars (Lea *et al.*, 1992) have argued that flaming cannot be explained by the medium alone, since the

amount of hostility varies tremendously across online contexts. They argue instead for a normative explanation, in which some groups create contexts that encourage more argumentative styles. Flaming has also been linked to masculinity, or "the chest-thumping display of online egos" (Myers, 1987: 241).

Despite the common sense that flaming is rampant in CMC, research suggests that it is perceived as more common than it actually is. Rice and Love (1987) found in their study of an organization's computer-mediated messages that although socioemotional expression was common, only 0.2% of the messages were antagonistic. Lea *et al.* (1992) theorize that flaming may seem more common than it is because single messages may be seen by so many people and because hostile messages are so memorable. In fact, people are considerably more likely to be nice than to flame in online contexts (e.g., Preece and Ghazati, 1998).

Gender

The speculation that flaming is associated with gender is indicative of a strong focus on gender that has characterized much of the linguistic work on CMC. Early CMC rhetoric often suggested that the elimination of the nonverbal cues to gender would result in the elimination of gender from language use, with optimistic consequences ranging from women's voices being granted more status to the elimination of gender as a meaningful cultural category. In some online contexts, gender becomes a subject for linguistic play. One much-studied MUD, Lambda MOO, offers participants nine gender options for their identity, each with its own set of pronouns (Danet, 2001). In addition to male, female, and neuter, people can choose to identify as: either, Spivak, splat, plural, egotistical, royal, or 2nd person. Third person descriptions of each of these options would be he, she, it, s/he, E, e*, they, I, we, you, and per, respectively.

However, research has consistently investigated whether the differences often noted in face-to-face conversation persist in CMC and whether gender can be identified from language style. Empirical findings are mixed, but do suggest modest gender differences. In discourse analytic studies of asynchronous discussions, Herring (2001) argues that men use an adversarial style, and women a supportive/attenuated style oriented toward affiliation. Although there is more overlap than difference in the messages written by men and women, Herring asserts that at the extremes, longer messages, strong assertions of opinions, and crude language are more likely to be written by men. One MUD described by Kendall (2002) describes the aggressive style of answering questions seen often within the group as MAS for

'Male Answer Syndrome.' Men are also more likely to open and close conversations. Sexist language has also been found in CMC (e.g., Gurak, 1997). Kendall (2002), for instance, describes how women outside the group are depicted as sexual objects. When someone mentions seeing a woman, for instance, a typical response is "did you spike 'er?" (Kendall, 2002: 85).

Messages written by women are more likely to be short and to include qualifications, justifications, apologies, and expressions of support (Herring, 2001). Evidence for a female affiliative style can also be seen in the finding that women's IM closings take twice as many turns and are nearly three times as long as male closings. Women are also nearly three times more likely to begin SMS interactions with openings (Baron and Ling, 2003).

However, while Savicki *et al.* (1997) found that groups in which there were more men used more factually oriented language and calls for action, less self-disclosure, and fewer attempts at tension prevention and reduction, they did not find any gender differences in expressions of opinion, apology, questions, or even flaming. Ling (2005) finds that women's SMS messages are longer, exhibit more complex structure, and are more like writing than men's. In their statistical analysis, Savicki *et al.* (1997) report that gender had only modest explanatory power in differentiating the language style of messages.

Gender is a factor not just in message style, but also in perception of message style, with impacts on response (or nonresponse) to those messages. Herring (1996) argues that men and women differ in their perception of aggressive messages. While men are more likely to see them as evidence of freedom of speech, candor, and healthy debate, women are more likely to see them as hostile and unconstructive.

The Effect of Computer-Mediated Language on Offline Language Use

CMC offers a hybrid, playful, and occasionally confrontational style of language that closely resembles language in other media, yet has some distinguishing characteristics. As is often the case when new language forms emerge, some develop concern that standard language is under threat. Newspaper articles have worried, for instance, that the brief exchanges of instant messaging will lead to an inability to conduct face-to-face conversations or that nonstandard spelling and punctuation will decimate grammar as we know it. Although there have been few if any studies directly addressing this phenomenon, the evidence from studies of computer-mediated language do not offer strong reasons for concern. CMC has

been shown to have depended on a variety of influences, including the technology, the purpose of the interaction, the norms of the group, the communication style of the speakers' social groups offline, and the idiosyncrasies of individuals. There is no consistent standardized 'Computer Mediated Language.'

Baron and Ling's (2003) analysis suggests there are actually far fewer such deviations from standard language forms than people would expect given the attention they are paid. Furthermore, only a few of the nonstandard features of language that do occur in CMC are due to inattention or lack of awareness of standards (Herring, 2001). Most are instead deliberate choices made as language users adapt to the technical and social contexts of their interactions. The evidence thus suggests that people are aware that different situations call for different language styles, and are unlikely to lose the ability to hold face-to-face conversations, spell, or use punctuation as a result of time spent online.

Language Maintenance and Shift

M Brenzinger, University of Cologne, Cologne, Germany

© 2006 Elsevier Ltd. All rights reserved.

On the whole, the extent of endangerment of the world's language diversity reflects the distribution of languages on our planet. The highest density of endangered languages seems to exist in the

linguistically heterogeneous parts of the world. It happens that countries with very high numbers of languages are near the equator, such as Papua New Guinea, India, Brazil and Mexico, as well as the countries of central and western Africa.

An analysis of language endangerment globally shows that a crucial difference in language shift settings seems to be between contexts of globalization, nation-state contexts, and subnational contexts.

In a substantial part of the world, namely Australia, the Americas, Europe, and Japan, minority languages are increasingly under threat as they are replaced by the official languages of nation-states. However, this does not hold true for the vast majority of endangered languages spoken elsewhere, for example on the African continent. With about one-third of the world's languages, this continent is among the most linguistically rich areas on our planet.

Language maintenance activities emerge in quite different contexts and facets. Some French and Afrikaners feel a pressing need for such supportive measures even though their languages seem not to be immediately threatened by extinction. In contrast, speakers of endangered minority languages may refuse to get involved in activities that aim to maintain or revitalize the use of their ethnic tongue. Among linguists, the stances toward language maintenance also vary considerably. Some seem to want to work toward a maintenance of the world's linguistic diversity, which implies a challenge to either human evolution or a creationist design. On the other extreme, some linguists do not see it as their duty to get professionally involved in language maintenance activities. In the following account, language maintenance activities will be discussed with merely a pragmatic focus, i.e., the options and roles for speech communities, linguists, and international bodies such as the United Nations Educational, Scientific, and Cultural Organization (UNESCO).

Has there ever been a *Homo sapiens sapiens* proto-language, which, some 100 000 or 200 000 years ago, started the long process of diffusing into more than 100 000 languages, which have been reduced from that number to the approximately 6000 languages spoken today? Whatever possible scenario for language evolution one chooses to believe, it seems certain that our present language inventory is the remnant of a much richer pool. Furthermore, the shrinking of linguistic diversity seems to have picked up speed in the last few thousand years. This situation is of immediate concern to many linguists and numerous ethnolinguistic communities.

Terms like 'language death,' 'language murder,' 'language suicide,' and 'killer languages' evoke pictures in which languages themselves are alive or dead. Languages are portrayed by these terms either as suffering victims or as aggressive offenders, prior to any scholarly analysis. We should keep in mind that all spoken tongues are no more and no less than variations of human language. Groups of people may foster or give up an ethnic language, the latter having happened thousands of times. Communities and individuals who give up their ethnic language do not end up in total silence, unable to communicate

with anyone any longer. Such language shifters usually acquire 'modern' and more 'useful' languages. Language is one – some say the most important – asset of culture and identity. But cultures as well as identities change over time. Why then do some linguists seem to think that the status quo of language usage could and should be frozen?

While scholars would do well to refrain from sentimental statements on languages of other people, they may very well respect and assist in spreading the emotional attachment of the speakers themselves to their language. Minorities and their offspring very often experience the loss of their heritage languages as traumatic. For example, as First Nations people in Canada phrase it, without an ancestral language, people are no longer able to relate to their environment or to their spiritual world. Khwe in Namibia, Bretons in France, Ainu in Japan, Frisians in the Netherlands, Mohawks in Quebec, and many other ethnolinguistic minorities feel that way and want to maintain or regain their languages. With such communities, the question arises, what can be done and by whom?

The Intangible Cultural Heritage Unit of UNESCO has been working for more than 20 years with members of endangered language communities and linguists toward establishing an Endangered Language Section. These initiatives have resulted in the formulation of the documents 'Language Vitality and Endangerment' as well as 'Recommendations to the Director General' labeled 'Action Plans' in March 2003. I will highlight some of the key issues discussed in these documents.

It seems to me that there are basic differences in the types of language endangerment in different language contact settings. While we are quite familiar with the language endangerment situation in nation-state contexts, as found for example in the Americas, Australia, and Europe, we still know little about the other parts of the world. The greatest linguistic diversity still exists in Papua New Guinea and in Africa south of the Sahara. The threat to these languages differs from that in the previously mentioned parts of the world.

Ethnolinguistic minorities from nation-state contexts, such as the First Nations people in Canada or the Amazigh in Morocco, may benefit from examining the living experience and common practice of multilingualism in most sub-Saharan African communities. The latter, in turn, must learn about the experiences of minorities in nation-states because this will be their challenge in the near future. UNESCO is playing an important role by supporting African governments in establishing language policies that might help to allow for cultural and linguistic diversity within their nation-states.

The role of UNESCO in that process is threefold. UNESCO addresses governments on their educational and cultural policies within the frame of its 'Universal Declaration on Cultural Diversity' of 2001. But UNESCO in addition requests the active involvement of linguists and speech communities to safeguard the still-existing linguistic diversity. Noriko Aikawa, director of the Intangible Heritage Section of UNESCO, stated in 2001: "UNESCO's future strategy on languages is to strengthen co-ordination between language research, policy and education programs. The results of research should be immediately incorporated into appropriate language policies, educational planning and pedagogical tools." (Aikawa, 2004: 35).

Languages Are Threatened in Different Settings

The scenarios in which the world's language diversity is threatened range from subnational settings to national contexts and finally to environments that are formed by processes associated with globalization. It is crucial, indeed, for the understanding of various aspects of language endangerment, to consider the specific contexts in which language shifts occur. In the following discussion, three different settings of language contact situations will be distinguished: the global context, the context of nation-states, and the subnational context.

Global Context

Looking at the dynamics by which languages gain speakers in the context of globalization, we find that only a few languages benefit from global merging, and these languages at present seem to be mainly English and Spanish. The international exchange of knowledge and world trade are conducted to an increasing degree in only a few world languages, and some scholars seem to expect that, given this tendency, a world culture, based on one common language, will finally emerge from these developments.

But up to now, we can state that languages have not been replaced in the context of globalization. The so-called world languages – increasingly English only – are acquired as additional and not as first languages. For example, the integration of the new European Union member states accelerates the spread of English as the European lingua franca. In the course of this process, French will further lose second language speakers, but at the same time, none of the European national languages, especially not French, will lose first language speakers to English ('After Babel,' 2004).

Nation-State Context

In the context of nation-states, governments obviously rely on the languages in which they run the countries. National majority languages are widely established and used in administration, politics, science, and education, as well as in media and literature. Such national languages may not be confined to single political-administrative territories; the same language may be in such a dominant position in several nation-states. National languages may also not cover an entire nation-state, as we see in Quebec. However, common to all these national languages is the criterion that they are instrumentalized by governments, and with that they receive official support and recognition within nation-states.

In the same context of nation-states, we often find minority languages, which are threatened and marginalized by the dominance of established national languages. Languages of this latter type are, for example, Japanese, Finnish, German (German, Standard), and Dutch. In their areas of domination they endanger minority languages such as Ainu, Saami, Sorbic, and Frisian, respectively. At the same time, various forms of English are threatening and replacing minority languages in quite a number of nation-states, such as the United States, Canada, the United Kingdom, Australia, and New Zealand. Within north African states, national Arabic varieties are expanding – not only as a second language but also as a mother tongue – and replacing the ancestral languages of Amazigh communities.

Kiswahili (Swahili), in the Republic of Tanzania, and Setswana (Tswana), in the Republic of Botswana, are among the few African languages that are established as media of nationwide communication. Only these two sub-Saharan African languages have been described as threats to other languages in the context of the nation-state. Kiswahili threatens more than 130 other Tanzanian languages, while Setswana does the same to about 30 languages spoken in Botswana. Other African languages with a nationwide distribution, such as Kinyarwanda (Rwanda) and Kirundi (Rundi), do not threaten minority languages at all, because no minority languages exist within the national boundaries.

Subnational Contexts

Minority languages in many parts of the world, however, are threatened in subnational contexts. In sub-Saharan Africa, as just mentioned, very few African languages are established nationwide. On the national level, African governments predominantly use the imported languages of the former colonial powers, and these are the prevailing languages in national

administration, in secondary and higher education, in modern literature, etc. In most African countries, the knowledge of these imported languages is still – after 40 years of independence – confined to the educated elite in the urban centers. One indication that imported, formerly colonial languages have not developed into the languages of the masses is the fact that not a single African language has so far been replaced by French and English. The only exception on the African continent seems to be the language of the Guanche on the Canary Islands, who lost their Amazigh language to Spanish after their final defeat in 1496. If we consider Afrikaans as a European language, then of course quite a number of Khoisan languages have been replaced by that Indo-European language, which is spoken exclusively on the African continent.

For that reason, language displacement in sub-Saharan Africa occurs, in by far the most cases, in subnational contexts, i.e., minority languages are generally not replaced by established national majority languages. Language shift takes place in local contact situations and for quite different reasons. For example, speakers of a minority language may shift from their language to another due to the adoption of a different religious faith. Former hunter-gatherer communities may assimilate to pastoral societies not only in the mode of production but also by taking the language of the pastoralist. Thus, African minority languages are threatened and replaced by other African languages, languages which themselves are very often minor languages within the nation-state.

Ethnolinguistic minorities in sub-Saharan Africa generally live in complex language contact situations in which they are marginalized in subnational contexts and for various reasons. The processes that may lead to the extinction of their languages are very different from those that affect minority languages in the contexts of nation-states. In the latter context, minority languages are generally threatened because they are dominated by national majority languages. In sub-Saharan Africa, in contrast, most languages of ethnolinguistic minorities have survived until today precisely because their speakers have been and are being marginalized and neglected, in other words, excluded from national developments. Of course, this should not lead us to be cynical and to conclude that it may be better to let the people suffer in order to keep their languages alive, so to speak. With continued efforts and good fortune, the sub-Saharan African nations, too, will progress further, and nation-states there will become the dominant frames of reference for minorities and their cultures. Then, policies that respect and appreciate cultural and linguistic diversity as an asset rather than an obstacle

to national unity may help to foster the use of heritage languages among minority communities. This seems to be one of the most prominent fields for further activities for UNESCO and also for linguists.

Which Languages Are Endangered?

The evaluation of the state of vitality of any language is a challenging task, mainly because speech communities are complex and language use patterns within these communities are difficult to explore. In addition, poor infrastructure and rigid political conditions may not even allow for determining the number of actual speakers of a language.

In 2001, an Ad-hoc Expert Group on Endangered Languages was asked by the Intangible Cultural Heritage Unit of UNESCO to prepare a draft overview of the threat to the world's language diversity. From March 10 to 12, 2003, an International Expert Meeting on Endangered Languages was held at the UNESCO headquarters in Paris, and linguists and language planners, representatives of nongovernmental organizations, and members of endangered-language speech communities discussed the draft. Two documents, namely, 'Language Vitality and Endangerment' and recommendations to the director general (labeled 'Action Plans'), were formulated in March 2003.

In the first document, nine major factors are identified to assess the language situation of endangered languages (see **Table 1**).

Factors 1 through 6 focus on the assessment of a language's vitality and its state of endangerment. The single most important factor is the first one, which asks for the extent of language acquisition among the children within a community. It is obvious that a language without any young speakers is seriously threatened with extinction.

Factors 1 through 5 are meant to capture the dynamics of the processes of a given language shift situation. The proportion of speakers within

Table 1 Factors for assessing endangered languages^a

Degree of endangerment

1. Intergenerational language transmission
2. Absolute number of speakers
3. Proportion of speakers within the total population
4. Loss of existing language domains
5. Response to new domains and media
6. Material for language education and literacy
7. Governmental and institutional language attitudes and policies, including official status and use
8. Speakers' attitudes towards their own language

Urgency of documentation

9. Amount and quality of documentation

^aUNESCO, 2003.

a community (factor 3) reveals an important aspect of language vitality: is the minority language an essential indicator for being regarded as a member of the community or not? The Arggobba in Ethiopia, for example, strongly insist on and declare their ethnic identity and origin even though their language has disappeared and it is not known whether any speakers of Arggobba still exist among the more than 60 000 Arggobba.

Loss of domains (factor 4) for an ethnic tongue may be triggered by, for example, the introduction of formal education or by new job opportunities for members of minority groups. A change in religious affiliation can also result in a shift to another mother tongue, a language that is associated with the new religion (factor 5). For example, Hausa and Dyula (Jula) spread in west Africa along with Islam. An outstanding example of the correlation between language and religious affiliation is the community of the Jeri leatherworkers, who live among the Sienare Senofo in the northern part of the Ivory Coast. The members of the Jeri community abandon their own language and adopt two different languages as new mother tongues according to their religious affiliation: "Sienare with the non-Muslim, and Manding with the Muslim Jeri" (Kastenholz, 1998: 259).

Factor 6 relates to the stage of development of a given language ('Ausbau'). Is there a community orthography? Have they agreed on a common standard form for writing the language? Do teaching and learning materials for the language exist? Is literature, such as newsletters, stories, religious texts, and so forth, published in that language?

Factor 8 assesses the speakers' attitudes toward their ethnic language, and factor 7 deals with the government's policies toward that language. And finally, factor 9 attempts to evaluate the urgency for documentation by asking for the quantity and quality of existing analyzed language data.

For minority languages in national contexts, such as in Canada, New Zealand, and Morocco, it is obvious which of the languages have to be regarded as being endangered, i.e., the First Nations languages, Maori, and Amazigh, respectively. In other contexts, all these nine factors should be taken together in surveying the overall sociolinguistic situation of a language with respect to its degree of endangerment.

What Is Actually Lost When Languages Vanish?

The preamble to UNESCO's 'Language Vitality and Endangerment' document includes the following statement:

The extinction of each language results in the irrecoverable loss of unique cultural, historical, and ecological knowledge. Each language is a unique expression of the human experience of the world. Thus, the knowledge of any single language may be the key to answering fundamental questions of the future. Every time a language dies, we have less evidence for understanding patterns in the structure and function of human language, human prehistory, and the maintenance of the world's diverse ecosystems. Above all, speakers of these languages may experience the loss of their language as a loss of their original ethnic and cultural identity. (UNESCO, 2003: 2, with permission.)

Obviously, linguists need language data from as many languages as possible in order to reconstruct language history, set up typologies on aspects of structure, or understand concepts underlying languages. But above that, do endangered languages offer anything special to linguists?

In his article 'The endangered languages of Ethiopia: what's at stake for the linguists?' Hayward (1998) provides several examples of unusual structural phenomena that exist only in endangered Ethiopian languages. For example, an established typology of number systems had to be fundamentally revised because of linguistic forms found in Bayso (Baiso), an endangered language spoken in the southern part of Ethiopia.

The lexicon and categories of each language are based on and reflect a certain conceptualization of the world. The human population shares more and more perceptions of the world channeled through a rapidly spreading global culture. With that, concepts diverging from the global norms are rapidly fading and appear to be the most vulnerable assets of languages. The numeral systems, spatial orientation, and taxonomies are only some of the areas that are being homogenized in this process (Brenzinger, 2003).

As a final example, even the sounds of languages may no longer be heard, which is unquestionably an essential loss, maybe not only for linguists. The bilabial click, also referred to as the 'kiss click,' had been reported by the late Oswin Köhler (personal communication) to be extinct with the death of the last speaker of a Southern Khoesan language in the early 1970s. At the same time, Anthony Traill collected language data from !Xóǀ, "the last of the Southern Bushmen languages that were once spoken throughout southern Africa" (Traill, 1985: 6). With these approximately 1000 speakers of variants of !Xóǀ, a unique sound of human language, the kiss click, has survived until today.

In turning to the speakers themselves, we may ask: do they suffer from any loss when they abandon their heritage language?

Lee Cronk, an American social anthropologist, has studied the change in ethnicity and culture of a former hunter-gatherer people in Kenya. This community was formerly known as Yaaku, then Mukogodo, and today they belong to the Maasai society. The community lost the former Cushitic language and adopted the Maa language. The Mukogodo took over the pastoral mode of production and along with that the culture of the Maasai.

Mukogodo [born around the 1930s] and before were born in rock shelters, grew up speaking Yaaku, and ate honey and wild game. Younger people were born in small houses, grew up speaking Maa, and drink milk and eat meat from goat, sheep, and cattle. In the past few decades, Mukogodo have also begun attending schools, getting jobs in and outside the Mukogodo area, and even traveling to Ulaya [Europe] itself. Change has been the norm for most humanity for the past century or more, and nowhere has it been faster or more dramatic than among the Mukogodo. (Cronk, 2004: 2, with permission.)

Maasai culture has spread over a wide area of east Africa, and several hunter-gatherer communities have lost their distinct identity and language in the “homogenizing force of Maasai society and culture” (Cronk, 2004: 143). Cronk captured an experience I had while working with a Yaaku elder in 1990:

One day while conducting an interview with an elderly Mukogodo man about the old language [Yaaku], Brenzinger played back some Yaaku phrases that the man had spoken earlier into a tape recorder. At first, the man was delighted to hear the old language, even if it was coming from a box rather than from a person. Not really understanding the principle of the tape recorder, he tried engaging it in conversation, giving the customary cheery ‘Eiuwuo!’ response to the recorded greeting ‘Aichee!’ But soon it became obvious that the tape recorder did not really know how to carry on a conversation in Yaaku. The man first became frustrated, then very angry, and finally he began to weep. (Cronk, 2004: 83, with permission.)

In 1990, only a few elders remembered fragments of the old Yaaku language, and the emotional affection for the Yaaku language, as expressed in the above story, was not shared by other community members. The young members of the community were not interested in the language of their grandparents, whom they thought of as ‘primitive’ cave people, even though some of them were still alive. The community had adopted the Maasai lifestyle and values in sharing the high appreciation for cattle and Maasai customs such as female circumcision, the age-set system (in which groups of men go through initiation and other stages of life together), and marriage ceremonies.

Although the Mukogodo-Maasai decided to abandon their former language and culture, many other indigenous peoples insist that linguistic (and ethnic) identity is essential and enables them to respond to the everyday challenges in their lives. The deep-rooted emotional affection of many speakers for their language has been expressed very often. The following statement is by Christine Johnson, a Tohono O’odham elder, for the American Indian Language Development Institute in June 2002.

I speak my favourite language
because
that’s who I am.
We teach our children our favourite language,
because
we want them to know who they are. (UNESCO, 2003: 1)

There are members of various globally dominant cultures who think that the worldwide spread of one language, of course their own (together with their culture, economy, and religion), would be for the benefit of all humankind. Obviously, not everyone agrees on that. However, one also has to respect the will of communities that decide to abandon their language and culture, as described with the former Yaaku, today’s Mukogodo-Maasai.

What Could and Should Be Done?

What is the first priority when languages are threatened by extinction? Among scholars, there is hardly any argument: documentation, i.e., research on and collection of data from endangered languages, is the fundamental task for linguists working in this field.

Within ethnolinguistic communities discussions on the future of their ancestral languages are far more complex, and quite diverse opinions are expressed. Those speaking endangered languages often consider their own language as being backward and not functional for themselves and future generations. Other communities, however, experience threats to their languages as a crisis and commit themselves to language (re)vitalization activities, establishing environments, such as kindergartens, in which their languages are exclusively spoken in order to stabilize their mother languages among the young generation. An increasing number of ethnolinguistic minorities want more. Firstly, they demand control over the terms and conditions that govern the conduct of research; secondly, they claim rights on research outcomes and also want to have a say in how research results should be used and disseminated.

There is a minimal consensus among linguists on the overall importance of the preservation of

language data of endangered languages. However, reactions to demands for assistance by the speech communities with which linguists work may vary widely. Such requests relate mainly to four areas, which may be regarded as essential for safeguarding endangered languages.

Language Work

Many scholars working with ethnolinguistic minorities are willing to help develop practical orthographies that can be used by community members themselves. And some scholars assist communities in the production of reading, learning, and teaching materials.

Capacity Building

Capacity building in this context may refer to the training of local language workers in reading and writing their own languages, the production of reading materials, etc. More privileged settings further allow for the training of language teachers. The formation of local, academic research centers in which speakers of endangered languages are trained to study and document their own languages is possible with quite a few ethnolinguistic minorities. And an exceptional case for the African continent is the Royal Institute for the Amazigh Culture, in which professors and researchers have worked since October 17, 2001, in a national research institute at the University of Rabat to document and develop their own threatened mother tongue, Amazigh.

Language Policy

Language policy is a highly sensitive issue in well-established democracies and even more so in countries that are still struggling to find their way to good governance. Very few linguists are actively involved in the formulation of national language policies in countries of the first kind, and none I know of in those of the second.

In the educational sector, quite a number of linguists are engaged in implementing mother tongue education programs to safeguard ancestral languages. Mother tongue education has become more popular in most parts of the world over the past 15 years, and UNESCO has been instrumental in this development through its policy statements and related activities since 1953.

Looking at endangered languages, however, we find that in many Asian and African countries, so-called mother tongue education does not refer to the ancestral languages of ethnolinguistic minorities but to the use of local, provincial, and national dominant languages as the media of instruction. Less than 10%

of the approximately 2000 African languages are currently employed as media of instruction in the educational sector, with not even a single endangered language among them. Mother tongue education in many cases further cements the position of languages that spread at the expense of endangered languages. As linguists, we are obliged to support any attempt to use African languages in formal education, but with that we may involuntarily help to threaten the languages of ethnolinguistic minorities, which are not included among the media of mother tongue education. There seems to be no way out of this dilemma.

Living Conditions

Dealing with the living conditions of communities is commonly not considered to be within the assignment of linguists. Nevertheless, linguists could help to overcome problems caused by economic poverty and lack of education. For example, national HIV/AIDS awareness programs do not generally consider the often-illiterate ethnolinguistic minorities. Materials produced for these marginalized communities require input from linguists because the concepts and contents need to be conveyed in a culturally meaningful way. Only then can these communities understand the challenge of HIV/AIDS and react to it appropriately.

Roles for Linguists and Speech Communities

Maintaining language diversity demands the involvement of linguists, language planners, and policy makers. Akira Yamamoto has been rightfully demanding for many years that ‘research in endangered language communities must be reciprocal and collaborative’ because only in working together with the communities are linguists able to contribute to the safeguarding of endangered languages.

Some scholars estimate that in the last 500 years at least half of the languages formerly spoken throughout the world have disappeared. They suggest that only 10% of the present day languages are safe, i.e., not threatened with extinction. To safeguard the vast number of endangered languages requires actions in quite a number of different areas, far more than the few mentioned above. The specific activities that can and should be carried out in a given research setting are determined by several factors. Each research context has its specific limitations and prospects, and these always depend heavily on communities’ attitudes toward their own language and their perception of the research carried out on it. And yet, the professional and social competence of a researcher is crucial in determining what is actually possible in the collaboration between the scholar and the speech community.

Having a linguist who is a member of the community does not always keep other community members from doubting linguistic research being carried out on an endangered language. Ofelia Zepeda, a trained linguist who wrote her Ph.D. thesis on her mother tongue, describes the most critical challenges to her linguistic work, which came from her own people, the O'odham. The objections to her work came from two different angles. The few O'odham people who had received some linguistic training some years before her, instead of supporting her, created obstacles to her work.

Interestingly it was this small group of skilled O'odham language teachers who looked at my publication critically and in their own way offered criticism. However, their criticism was often not constructive or friendly. While still other O'odham people, taking the conservative position, let me know that it was wrong to write the language and to publish it for wide dissemination. (Zepeda, 2004: 7)

Dr Zepeda published *A Papago grammar* in 1982, but the O'odham people have only now, after more than 20 years, started to acknowledge her academic and community work on her mother tongue.

Proficiency in nationally and internationally dominant languages will gain importance throughout the world and, for that reason, will continue to spread. This development does not necessarily require the sacrifice of other languages, i.e., mother tongues of ethnolinguistic minorities, because most societies have always been multilingual. However, speakers might decide to abandon a low-prestige ethnic tongue for the benefit of social mobility and career opportunities. Languages are either maintained or abandoned by their speakers. In these situations, ancestral languages can survive in the long run only if meaningful roles for them can be established in the lives of the community members. Ultimately, in order to maintain and perpetuate the world's language diversity, these speakers have to find good reasons for keeping their ancestral language alive in natural everyday communication with their offspring.

Language Planning and Policy: Models

B Spolsky, Jerusalem, Israel

Just as with many new fields, there continues to be disagreement over the name of this one, variously called language policy (Nesiah, 1954; Sibayan, 1974), language treatment (Neustupný, 1970), language cultivation (Prague School, 1973), language engineering (Sibayan, 1974), language planning (Haugen, 1959), and language management (Jernudd, 2001). While the last five are more or less synonymous, referring to attempts by authorities to modify language behavior, the first can refer to the customary practices in choice of language items and variety in a speech community, or to a specific decision or set of decisions to modify those practices. To avoid confusion, we will use the terms as follows. The language policy of a speech community (an undefined term, ranging in size from a family through a nation-state to a multinational grouping) consists of the commonly agreed set of choices of language items – whether sounds or words or grammar – or language varieties – whether codes or dialects or named languages – and the beliefs or ideologies associated with those choices. It can be found in language practices and beliefs or in formal policy decisions such as laws, constitutions, or regulations. Language management, planning, engineering, cultivation, and

treatment are actions taken by formal authorities such as governments or other agencies or people who believe that they have authority, such as parents, teachers, or academies, to modify the language choices made by those they claim to have under their control (Spolsky, 2004). Language management itself has three components: the development of explicit language plans and policies, their implementation (by rules or laws or resource allocation), and the evaluation of results and effects (cf. Rubin and Jernudd, 1979: 2–3).

Managing Bad and Good Language

Language policy makers and analysts apply the term policy and its synonyms to a wide variety of administrative levels ranging from international organizations (Van Els, 2001) to world regions (Extra and Gorter, 2001; Kaplan and Baldauf, 2003) to countries (Grenoble, 2003; Lo Bianco and Wickert, 2001), or to single educational institutions (Karyolemou, 2002). The term has been expanded to include what is referred to as 'grass roots language policy', that is, policy originating in or influenced by the affected members of the speech community (Hornberger, 1996). Cooper (1989) shows that it can usefully be applied to a family level.

The main principles of language policy become evident even at this simplest level. In any family, there is language policy, as shown by the normal choices of

language in the speech practices of the group, viz., which variety of language is addressed in practice to each member. For instance, baby talk (Ferguson, 1964) may be used with very young children, heritage languages (Cummins, 1983) with grandparents, or community languages (Smolicz and Secombe, 1985) with outsiders. In immigrant families, there is commonly a difference in language usage between adults, older children, and younger children. There are socially determined differences concerning who usually has the right to speak and what topics and forms of language are appropriate when the family gathers. In conversations between adult caretakers and children, there are commonly efforts to manage language choice, whether by encouraging the use of one variety or by attempting to discourage bad language. Definitions of what is bad language vary socially. It may consist of presumed mistakes in grammar or pronunciation, or the use of stigmatized forms or expressions such as cursing, obscenity, blasphemy, foreignisms, or inelegancies. Often beliefs or an ideology will be quite different from practice. Immigrant parents may think that their children should use either the heritage or the new language exclusively. Such beliefs may or may not lead to successful efforts at management.

The effort to avoid bad language and teach good language is carried outside the home into other institutions, particularly the school which takes a leading role in efforts to modify the language known and used by its pupils. Because of their central role in language socialization, school teachers are most comfortable, it seems, with a standardized variety of language, with clear statements on what is right and what is wrong. They commonly share the puristic belief, that there is a 'correct' variety of language, and, *contra* King Cnut, the key belief that language management is possible. They believe that they themselves use correct language: French teachers are sure they pronounce the *l* in *il vient* and Palestinian teachers are sure they teach in Modern Standard Arabic.

Correctness, however discovered or defined, is one common criterion for good language (Guitarte and Quintero, 1974). Another is the avoidance of obscenity, sometimes institutionalized in laws and regulations at the local and national government level. The United States has federal laws against obscenity, but standards and definitions are local (Harrison and Gilbert, 2000). Blasphemy, an obvious concern of religious institutions, is unlikely to be a matter of legislation in secular nations, but remains an issue in the many states with religiously dominated constitutions such as Pakistan. Seditious language, as opposed to actual sedition and violent language ('fighting words' in the laws of some southern U.S. states) is also criminalized in some nations.

A more recent criterion for good and bad language is 'political correctness', the avoidance of chauvinist or racist language. The campaign to avoid words or expressions that stigmatize racial or religious groups or that express prejudice based on gender (assigned or constructed) is about half a century old in the West. In the United States it has led to language management efforts especially by publishers and editors who try to ban gender-biased terminology and grammar (Pauwels, 1998).

A common criterion for language management, one that moves us closer to the realm associated with national language policy, is the avoidance of expressions and words considered foreign (Annamalai, 1989). One of the inevitable effects of culture and language contact, and it is difficult to distinguish the two, is a tendency to borrow foreign words along with the new concepts and artifacts that they label. In many situations, ideological opposition to foreign borrowings is nearly as strong as opposition to the use of foreign languages (Kroskrity, 1998). In Latin America from the conquest, there was puristic opposition to the use of 'americanisms', defined as words borrowed from native languages or locally coined, and a similar anti-foreign purism now calls for laws against borrowings from English (Rajagopalan, 2002). The idea of a pure uncontaminated language is widespread (Jernudd and Shapiro, 1989). Preventing linguistic corruption was and remains a key task of the French Academy. Most national language movements hold puristic beliefs, although the particular source of contamination (French in the Dutch-speaking portion of Belgium, Arabic in Turkish, Yiddish in Hebrew, Danish and now English in Icelandic) varies. Presumably, this represents a belief in the identifying and symbolic value of language. By admitting foreign elements, 'I may be weakening my national identity'.

Three important generalizations emerge from the discussion so far. One is the tension between pragmatic communicative goals (for instance, the caretaker aims to give the child the most efficient variety of language) and symbolic and social goals (identifying the speaker with a chosen social group). A second generalization relates to the linguistic and social levels on which policy can apply: linguistically, it can refer to a single sound or word (*ain't*) or to a labeled variety of language (jargon, English); socially, it can apply to a small social group such as a family or to a higher level such as a nation state or an international federation. A third generalization is that policy is manifested in practice, in beliefs or ideology, and in management activities, and while the three aspects are intertwined, they need not be consistent.

National Language Policies

Most analyses of language policy and management are concerned with formal, governmentally backed activities at the national or regional level aimed at controlling language knowledge and use within a country or region.

During the first phase of the study of language planning, Kloss (1969) proposed a useful distinction between what he called status planning, the determination of the status and functions of a language in a community (such as 'official' or 'national') and what he called corpus planning, the specification of the proper form a particular language should take (such as writing system or spelling or approved lexicon or grammar). Planning was considered an appropriate term in the 1960s, as one part of national development planning (Das Gupta and Ferguson, 1977).

Cooper (1989) added to these two the field of acquisition planning, the determination of which languages should be taught to those who do not speak them and how. While these three domains are conceptually distinct, in practice they overlap. Making a language variety official usually involves standardizing it, writing it down, and modernizing it. It also requires teaching it to citizens who do not know it. Foreign and domestic language policies are blended in situations like the status of French in Canada, the retention of colonial languages in Africa, and the status of trans-border languages in ethnic enclaves such as Swedish in Finland or French and Italian in Switzerland or French and German in Italy.

Corpus Planning and Management

Concern for the form of language may be discerned in the efforts of parents, teachers, and other caretakers to make sure that their charges speak clearly and use forms that are acceptable. It appears more fully developed and institutionalized in efforts to maintain the purity and correctness of sacred texts and in the educational systems that take on some responsibility for correctness. Indeed, language management agencies (Dominguez and López, 1995) are often part of a ministry of education.

More generally, in many countries, especially those where the issue of status is not salient, the largest share of language management is concerned with corpus policy, the prescription of the proper form a language should take, and the cultivation of a language to handle appropriate functions (Prague School, 1973). This can take a variety of forms. In many of the least developed countries and among some indigenous groups in developed countries, the

principal corpus activity is the adoption or adaptation of a script and the promotion of literacy among its speakers (Fishman, 1977).

Another frequent goal is language purification (Neustupný, 1989). Commonly this involves an attempt to return to a sometimes fictitious primal language, purging the modern language of loan words and expressions imported from other languages (Jernudd and Shapiro, 1989). Examples are the purging of Persian and the substitution of Sanskrit-based words in Hindi, and the reverse in Urdu (R. King, 2001). Similarly, the deletion of foreign influences in German during the Nazi years and the perpetual struggle of French against Franglais (Weinstein, 1989) are of the same order. Sometimes purification is more extensive. For instance, under Atatürk, a deliberate attempt was made to simplify and modernize Turkish (G. Lewis, 1999). Older linguistic forms borrowed from Ottoman Turkish, Persian, and Arabic were replaced with elements identified with a Turkic past, and the Perso-Arabic script was converted to a Roman one. Similarly, in China the development of Putonghua was accompanied by extensive modernization of vocabulary and morphology (Coulmas, 1991). In a similar vein, the attempt to create a pan-national standard Arabic and to diffuse it throughout the Middle East and North Africa, overlaying the sometimes mutually unintelligible country dialects, has required major innovation in the writing system, grammar, and lexicon of the language (Suleiman, 2003).

Sometimes corpus activity has been directed to the revival or rejuvenation of a language that historically had become fossilized or marginalized, for instance, the attempt to support the use of Quichua in the Ecuadorian Andes (K. King, 2000). Similar management may be found in the attempts to spread the use of Celtic languages in Ireland, Scotland, Wales, Cornwall, and Brittany. In the case of Cornish, extinct for nearly two centuries, and with only medieval texts available, the decision to revive the language required a major effort to rebuild the vocabulary.

Another example showing how corpus management fosters the status of marginalized languages is the use of institutional power to promote selected languages. For instance, the status of Hebrew was transformed from a sacred and literary language in the Jewish diaspora to the recognized language for everyday use in the Jewish community in Mandatory Palestine, a development which prepared for it for its role as the official language in Israel (Spolsky and Shohamy, 1999). Classical Arabic has been used to enhance religious identity among Muslims; in the Arabic speaking countries, it is usually listed alongside religion in the constitutional definition of

the state. After Indian independence, Sanskrit was listed in the Constitution as one of the official languages of India, was proposed as a medium for the transmission of news on the radio, and is now set as the medium of instruction in three universities. The new draft constitution of Iraq moves Kurdish close to equality with Arabic. An Official Maori Language Act in New Zealand provided official status for what was considered an endangered language. Official status is not enough – Ireland and New Zealand and Valencia were able to increase the numbers who have learned Irish and Maori and Catalan by adding resources for teaching the languages, but they have not so far been able to increase the number of people actually using the language.

The converse of the policy of promoting little-used languages is the deliberate removal or downgrading of languages. The systematic suppression of the use of Tibetan in China or Kurdish in Turkey or the autochthonous languages among the American North, Central, and South American Indians are clear examples. In the same vein, but less dramatic, are the efforts by the former Soviet states (Hogan-Brun and Ramonien, 2003; Landau and Kellner-Heinkele, 2001) to replace Russian with their titular language. While most of this policy is directed at language use – in government, the press, the media, the educational system – it also includes changes in the language itself. These changes include the purging of Russian forms and vocabulary (added during the period of Stalinist Russification) from the titular language, a search for alternative cultural and historical roots – in the case of Muslim states emphasizing Turkic origins – and the creation of neologisms both to replace Russian borrowings and to modernize the traditional language (Grenoble, 2003). In most of these nations, shifts to roman scripts had begun even before independence, but then became more pervasive. In some of the former satellite Baltic and Eastern European states, the Russian language has been stripped of its dominant position in government and the educational system.

Status Management

The status of a language variety refers to the domains and extent of its use and to its associated rankings in society. More particularly, status management usually refers to the designation of languages as official for use in the public sector and in the educational system. Most scholarly analysis of language planning and policy is concerned with status, although, as Fishman (2000) points out, status and corpus are usually intertwined. The nature of status policy depends substantially on differences in the number and types of languages spoken in a country (Lambert, 1999).

Countries with a single dominant language face a different set of policy issues compared with linguistically dyadic or triadic countries – those with two or three relatively equal languages. Similarly, countries that are linguistic mosaics, that have a large number of significant languages, have different sets of problems from monolingual and dyadic or triadic language countries.

Ideologically Monolingual Countries

Few countries are truly linguistically homogeneous – Iceland is probably the closest (Vikor, 2001) – but many countries in Western Europe, the Americas, and Asia have perceived themselves as being essentially monolingual. In Europe, this is especially striking in the face of persistent multilingualism. The recently published *Encyclopedia of the Languages of Europe* (Price, 2000) listed some 300 historical and currently used languages in Europe. Several of the countries in East Asia, too, essentially see themselves as monolingual although each contains important language minorities. In these cases, there is generally what Fishman (1969) labeled a single Great Tradition, which is associated with a single language. Generally, these countries leave the interest in the selection and standardization of the national language to the field of historical linguistics, but for those with a more recent history, there are studies looking at the first congress proclaiming the language (Fishman, 1993) and of the struggle for standardization. In linguistically homogeneous countries (Fishman, 1966a), the principal focus of language policy has been on corpus management, the cultivation and purification of the national language (for instance, Pedersen, 2003), supplemented in some countries – notably France, Germany, and Japan – by efforts to export the national language abroad (language diffusion policy) (Cooper, 1982).

Within ideologically ‘linguistically homogeneous’ countries, language policies that relate to linguistic minorities depend in part on the kind of minority involved.

Ethno-Linguistic Regional Minorities Long-standing, geographically concentrated minorities with a recognized history and culture receive the bulk of attention in both governmental and educational language policy, as well as in academic analysis. Examples of such minorities are the Swedish-speaking minority in Finland, the Sami in Finland, Sweden, and Russia, and the Celtic language communities in Ireland, Great Britain, and France. The dominant paradigm in European status policy and in academic analysis is the protection of such linguistic minorities against the absorptive effects of the dominant national language.

A wide variety of country and language specific case studies is now available (Dorian, 1998; Fishman, 2002; Grenoble and Whaley, 1998; Hale, 1991; Krauss, 1991). Most of them exemplify this approach. The use of terms such as 'threatened', 'dying', 'endangered' languages and at the extreme, 'language death', and 'linguistic genocide' reflect the nature of such analyses. The intended effect of these terms is to characterize the aspirations of ethno-linguistic minorities in terms of group and individual rights. These rights are elaborated by law in many monolingual countries, as well as in covenants and resolutions enacted by international bodies: The European Charter for Minority or Regional Languages, a Framework Convention for the Protection of National Minorities, The Oslo Recommendations regarding the Linguistic Rights of National Minorities, The Hague Recommendation Regarding the Education Rights of National Minorities, and the Universal Declaration of Linguistic Rights (Ferguson, 1968; May, 2001; Nic Shuibhne, 2001). For instance, the term 'other languages' of Europe is a product of an international organization, the European Union. It refers to "all languages apart from the eleven official languages that are ignored in public and official activities of the European Union (Extra and Gorter, 2001: 1)." In practical European Union policy, with its first principle of national sovereignty, the identification of a protected linguistic minority is reserved to the founder states, which have the option to exclude any variety they label as a dialect, as Sweden in 1995 decided that the Charter applied to Sami, Tormal Finnish, Finnish, Romani Chib, and Yiddish, but not Skanian with 1.5 million speakers, and France prefers not to recognize Occitan.

The effect of official designation of a minority language, whether within a country or internationally, can be of substantial benefit to the group, expanding its claim to educational and governmental support. Consequently, there is constant pressure to expand the list, drawing the line further down the continuum from language to dialect or giving legal identity to different types of languages. For instance, the deaf community has sought recognition of sign languages as separate minority languages, but the European Union continues to resist this. Efforts have also been made in the United States to declare Black English a minority language, and thus subject to special protection. There has been a movement to imbue the concept of language rights in a larger framework, the promotion of multilingualism for the general population, autochthonous or immigrant (Skutnabb-Kangas, 2000).

Policies toward linguistic minorities differ according to their relative size, their degree of geographic

concentration, their historical roots, their extra-country linkages, the strength of their ethnic identification, and the political activism of their leadership (Paulston, 1994). The features of official language policy that vary according to these characteristics are: (a) a language's role in the education system, in particular the class and school levels in which it is used, and whether it is taught as a subject or used as a medium of instruction; (b) its role in governmental affairs – the legislature, judiciary, administrative services, the military; (c) its role in the media, particularly that portion controlled by government; (d) the possibility of using it in access to governmental and commercial institutions, and (e) its use in the workplace.

In academic analyses of minority language policy, a number of constructs have been proposed to arrange language minorities along continua of relative vitality. A widely used scale is the Graded Intergenerational Disruption Scale (Fishman, 1991) based upon a language's presence in governmental affairs, education, adult use, and intergenerational transfer. The scale also purports to advise linguistic minorities on how to advance their status and how to promote the use of the language. It ranges from the most threatened eighth stage, where any effort needs to start with 're-assembling' the language from 'vestigial users . . . socially isolated old folks' and teaching it to adults, to the highest stage, where the language is used to some extent in 'higher level educational, occupational, governmental, and media efforts' but lacks the safety of political independence. In between, there are another half dozen levels, the most significant of which are probably the sixth ('intergenerational informal oracy'), the fifth ('institutional unsupported literacy') and the fourth ('use in official lower education'). In Fishman (2001), where various scholars are asked to comment on the scale, several raise questions about the ordering of the scale: for instance, there are many cases where institutionalized literacy teaching (commonly of a religiously sanctified language) continues even without much everyday oral use.

Fishman's scale was developed to account for the process that he labeled Reversing Language Shift, an attempt by supporters of a language to re-establish or establish its status. Also named 'language revival', the process of re-establishing natural intergenerational transmission (language revitalization) or vernacular use of a literary language (revernacularization) is most clearly exemplified by Hebrew.

The success of the Celtic revivals in various countries has depended on the extent to which they are backed by political power, as in Ireland where the Celtic language, Gaelic, has become a symbol of

nationhood, or in Wales, where a regional government has championed its use. However, even in countries and regions where there is strong governmental backing, only a minority of the population actually speaks the Celtic language. Other cases of revival involve territorial linguistic minorities.

Territorial Linguistic Minorities Territorial linguistic minorities also differ in the extent to which their speakers seek full political autonomy, as do the Tamils of Sri Lanka, and some of the Basques in Spain. For most groups, however, the goal is limited to the use of the minority language in governmental affairs and at various levels of the education system. For instance, in Spain in three constitutionally mandated autonomous regions, Basque, Catalan, and Galician languages are not only taught in schools, but public use of the language is actively promoted, and, because their speakers occupy their own political units within Spain, they can determine their own official language policy within their territory (Turell, 2001). By way of contrast, in France, the Basque-speaking sections bordering on Spain are not officially recognized as separate language groups, they do not comprise a separate political unit, and they cannot determine linguistic policies. In France, the promotion of the Basque language is left to voluntary initiatives. In a similar vein, the various Celtic languages represent different kinds of territorially specific language minorities with varying claims on governmental power – one result of autonomy for Wales and Scotland has been to boost the claims of Welsh and Scottish Gaelic. In New Zealand, the campaign for Maori language regeneration accompanied a series of legal claims before a Tribunal set up to remedy failures to carry out provisions of the 1840 Treaty of Waitangi, most of which sought financial reparations for lost land and hunting and fishing rights (Spolsky, 2003).

There are many other territorially-concentrated linguistic minorities elsewhere in Europe, such as the Frisians in the Netherlands who receive special treatment in support for their bilingual education but not in their dealings with government (Gorter, 2001). Special accommodation is also made for territorial linguistic enclaves whose residents are speakers of languages of neighboring countries. For instance the Swedes in the southwestern corner of Finland (Vikor, 2000), and the Germans in the contiguous border regions of Belgium (Aunger, 1993), Italy, and France are examples of transborder linguistic minorities, the former deriving recognition from historic political union and continuing territoriality.

There are a few long-established linguistic minorities that are not geographically concentrated and that

typically receive less policy attention. Of these, the most notable are the Roma or Romani, who are scattered and peripheralized. In its negotiations with new candidates for membership, the European Union generally exerted considerable pressure to have these languages supported, following a principle of ‘do what I say and not what I do’ and not giving them the privilege accorded to foundation members of choosing which varieties to support. While the main goal of Chinese language policy has to do with developing the common language (Putonghua) and in simplifying the characters used for writing Chinese, the cultivation and preservation of minority languages has now been added as a goal (White, 1997). After most speakers of Yiddish in Europe have been killed or have emigrated, some European countries now recognize Yiddish as a minority language (Hult, 2004).

Paulston (2004) has proposed what she calls “extrinsic linguistic (or ethnic) minorities,” groups such as the Russians in Baltic Republics who went from being majorities to minorities by legal measures or the moving of borders or grants of independence, but who continue to show strong language loyalty.

Aboriginals Like other territorially concentrated linguistic minorities within homogeneous states, culturally distinct autochthonous groups receive a great deal of attention both in language policy and in academic analyses. Often the languages of such groups are in a wide variety of stages of development. Hence, a primary focus of management is on alphabetization and the promotion of literacy and oracy. In most cases, the drive for language rights among aboriginal groups is tied to cultural revival and reinforcement. Linguistic groups whose members are still active speakers of their languages and who are territorially concentrated, such as the Samis in the Nordic countries (Jernsletten, 1993) and Russia, or the Quichua (K. King, 2000) in the Andean highlands of Peru, Bolivia, and Ecuador have greater success in achieving special treatment in language policy. More dispersed aboriginal groups such as the American Indians and the aboriginal tribes in Australia who are dispersed through a hundred different regions (Lo Bianco and Rhydwen, 2001), have an even greater difficulty in language maintenance – although the Navajo have had some success (McCarty, 2002; Spolsky, 2002). An exception are the Maoris in New Zealand who have had great success in cultural and linguistic revival through concentrated political agitation and through the use of Maori in Te Kohanga Reo, the preschool ‘language nest’ programs and the subsequent development of immersion education in

elementary schools (Benton and Benton, 2001). Autochthonous minorities, although commonly suffering from political and social and economic discrimination, at least can claim that they were there first. Autochthonous languages are obviously especially endangered, for they lack other territories where they are spoken.

Immigrants Language policies are much less accommodating to the needs of immigrant groups. In fact, almost all of the international covenants supporting the rights of linguistic minorities apply only to citizens, arguing that immigrants chose to live in the country and so can reasonably be expected to make an effort to learn its language. In addition, the claim that the preservation of immigrant languages is required for maintenance of language diversity is a weak one, for their languages are usually spoken in the country from which they come. However, recently this distinction has been blurred (Hornberger, 1998). In the early years immediately after World War II during the first major flow of 'guest workers' into Europe, they were expected to go back to their home countries after a brief sojourn. Moreover, at that time, any service of their linguistic needs in education was supposed to be provided by their home countries. In addition, immigrant groups tended to be widely dispersed in cities and did not constitute a separate territorial unit. Over more recent decades, their numbers have grown immensely, particularly with Eastern Europeans migrating into Western Europe, citizens of former colonies moving to the metropolitan homeland, and a major wave of migrants from Islamic countries. As their numbers have grown, they have not tended to form separate territorial groups, although their concentration in urban areas, their numbers, and their growing political influence have come to require special educational and governmental accommodation. These may include the provision of instruction in the home language in primary schools, the translation of government documents and court proceedings into the home language, and, in some countries, support for instruction of new immigrants in the national language of the country. In spite of expressions of support for immigrants and their human rights, there has been a tendency to require proficiency in the official language for citizenship and in some cases for immigration.

The United States provides a clear example of this transformation. Over two centuries, massive waves of immigrants have been absorbed. Historically, they tended to be widely dispersed into a number of cities, where little islands would be created. Each group, however, was expected in time to merge into the general population, including the learning of English

(Fishman, 1966b). After a period when immigration was restricted by legal quotas, the number of immigrants has increased rapidly. As a result, there are now 3 million children in the United States who speak at home a language other than English. They are referred to as Limited English Proficiency (LEP) children. Three-fourths of the LEP students are Hispanic, and instead of dispersing throughout the country they have become a major territorial language minority in Florida and the American southwest and West, particularly California. One result was the institution of language rights accorded territorial linguistic minorities elsewhere, including a highly institutionalized system of bilingual education in primary schools, and representation of Spanish in public life and the media (Roca, 2000). This development has given rise in some states to reverse pressure to enact legislation banning bilingual education and making English the only official language (Baron, 1990).

Dyadic or Triadic Societies

Countries that have two or three major recognized languages such as Canada, Belgium, Switzerland, Sri Lanka, and Cyprus, each with its own territory, have problems of language policy different from those facing ideologically homogeneous countries. In such countries, language management issues tend to pervade large sectors of the educational system and public life. As in linguistically homogeneous countries, some provision may be made for lesser language minorities, but the fabric of the state itself tends to be linguistically consociational involving only the primary languages. The preferred solution to any conflict is territorial: governmental and educational institutions are organized separately in the different language areas, and political power is carefully balanced between the linguistic units. An extreme example is Belgium, a country historically formed by uniting monolingual territories. After four governmental crises based on language issues between 1979 and 1990, the country was partitioned into different language regions: (a) areas that are exclusively monolingual in Dutch or French, (b) areas such as Brussels that are officially bilingual, and (c) areas that are monolingual but provide some minority language rights (Deprez and Du Plessis, 2000). Switzerland has a longer-established form of consociational linguistic territoriality, but restricts its implementation primarily to educational and governmental affairs; each of the 27 cantons is autonomous in language choice. Canada, too, was formed out of previous, distinct French and English territories. To maintain unity, it is formally bilingual, but French-speaking Quebec periodically attempts

to gain independence from the other, primarily Anglophone-speaking, provinces of Canada. A series of referenda for Quebec's independence has not gained a majority of votes in Quebec, defeated by negative votes from a combination of Anglophones, aborigines, and immigrant communities. However, in Quebec province itself, the use of French in all governmental affairs, education, and public displays is mandated (Bourhis, 2001). In Anglophone Canada, an innovative policy was introduced whose intent was to disarm the Quebec separatist drive. Schools for non-francophones require their students to enroll in immersion classes to make them proficient in French. This widely watched program has been only modestly successful.

In some countries, the relationship between the ethno-linguistic groups is so contentious that the country breaks apart, as in the former Czechoslovakia and Yugoslavia (Bugarski, 2001). In post-independence Pakistan, two linguistically different sectors were separated by a thousand miles – a Bengali-speaking Eastern half and an Urdu-, Punjabi-, and Sindhi-speaking western half (Rahman, 2002). After a bitter war, the eastern sector became a separate country, Bangladesh. A two millennia-old conflict between Tamils and Sinhalese in Sri Lanka is in danger of partitioning the island into two countries, as is the conflict between the Greece- and Turkey-oriented halves of Cyprus. Sometimes in binary societies, one language group dominates the other as in the Sudan where the Arabic-speaking North dominates the lower multilingual, tribal-based south, or in Israel, officially bilingual in Hebrew and Arabic, where Arabic (though benefiting from more use in education than in many nominally Arab countries (Amara and Mar'i, 2002)) is clearly dominated by Hebrew.

In dyadic nation states, then, the key management problem usually remains the resolution of competing demands for status between two languages with strong claims.

Mosaic Societies

Most countries are neither homogeneous nor dyadic nor triadic in composition. Indeed, the majority of countries in the world are made up of five or more important ethno-linguistic and territorially discrete segments. The problems of language policy, both corpus and status, in mosaic countries such as India, Indonesia, the Philippines, and most of the countries of Africa are immense and complex. Here, status and corpus are inexorably linked: a language's claim to official recognition is clearly bounded by its state of cultivation, for it is difficult to use an unwritten language in schools or an unmodernized language to teach science. In many of these countries, the

overwhelming primary concern is corpus management, in particular the development of a written form of the languages, the promotion of literacy among the public, modernization by developing new terminology, the staging and duration of language instruction at the various levels of the educational system, and the preparation of teaching materials and teachers. Moreover, the solutions to status policy issues that are available in ideologically monolingual, dyadic, or triadic countries do not apply where there are many languages.

In mosaic societies, even the number of languages spoken in a country is often uncertain. Various counts have enumerated between 1000 and 2000 languages in Africa. In Nigeria alone, a variety of linguistic censuses have found 200 to 400 languages. At last count, there are 535 languages in India. In the late 19th century, Grierson counted a thousand. In all of these countries, the number of language varies immensely in part because the dividing line between languages and dialects is indistinct and political rather than linguistic.

Those who wish to develop language policy in such countries face a number of special challenges. In many of them, a single over-arching language was introduced by the former colonial power and is still used by a small elite. There were two major approaches to colonial language policy. France and Portugal (like Spain in Latin America) were consistently ruthless in requiring the metropolitan language for all government and for any education they supported. After its experience in India, Britain in other parts of the world followed what might be called a modified Oriental policy, providing initial education (at least the first two or three years and sometimes up to secondary school) in reasonably populous indigenous vernacular languages, at least those with a writing system. German and Belgian colonial policy similarly allowed a small place for vernacular languages. After the primary level, both approaches then accepted the centrality of the metropolitan language, but the British did encourage some continued cultivation of some indigenous varieties.

In the optimistic days after World War II, post-colonial political pressure was to dethrone the colonial language and nativize the choices of national languages. A number of African and Asian former colonies started to indigenize their schools. However, the initial pressure for abolishing the colonial tradition has had to be balanced against the tendency among indigenous elites in many former colonial countries to distinguish themselves by their command of the colonial language (Myers-Scotton, 1993), and increasing proportions of the population see the command of that language as the path to

upward mobility. Moreover, the exclusive choice of native languages sacrifices links to modernity and international communication. As a result, the use of ex-colonial languages lingers and may be growing. For instance, while the Indian constitution prescribes that English was to be abandoned as a national language within ten years, it still remains one of the official languages. Moreover, Indians of all social classes see the mastery of English as the avenue for upward mobility, and enrollment in English-medium private schools is growing (Dua, 1996). Similarly, in most former Francophone states in Africa, French remained the official language after independence, to be threatened most recently by globalizing English rather than by local national languages (Chumbow and Bobda, 2000).

The process of nativization, with its shift to indigenous languages, is handicapped by the number of those languages and their regional or tribal identification, with all of the status implications resulting from selection of one or a few languages and so favoring its speakers over others. Solutions adopted in a variety of countries include the creation of a fresh lingua franca, usually adopting a local dialect, often one close to the capital city, or adopting a regional language. The use of the new lingua franca is then promoted for use in the education system, in government, and in the media. One of the most striking examples is Bahasa Indonesia, developed out of Malay and now the national language (Dardjowidjojo, 1998). Malay was also the basis of Bahasa Malaysia, and the slight variant Bahasa Melayu developed in Malaysia and Brunei, but there are new pressures for English to be used there (Omar, 1998). Other cases are Tok Pisin, in Papua/New Guinea, Filipino, a variant of Tagalog, in the Philippines, and the adoption of Swahili in Tanzania and East Africa. It should be noted that in Malaysia, there has been a decision to move to English-medium instruction at all educational levels (Gill, 2002).

Many mosaic countries have chosen a language policy model which reflects one or another stage in the history of language policy in the former Soviet Union (E. Lewis, 1972). In the early Soviet period, the languages of the 15 principal language regions were declared to be of equal status. Each was declared the official language and taught in the schools in its own region. Every child had the right to be educated in his or her own language. Russian was to be *primus inter pares*. The decision to encourage and cultivate the vernaculars was based on the principle that it would be the fastest way to develop communism among illiterate peoples, and Grenoble (2003) notes that this policy did result in the rapid development of literacy. Under Stalin, with the pressure for central control,

the status of the regional languages was downgraded and the spread of Russian was promoted.

India initially adopted the Soviet model. At Independence, the boundaries of the states were redrawn from the multilingual units they had been under British rule to more or less monolingual units, taking into account the major literary languages, as the political parties in the independence movement had urged. In the years immediately after independence, there was a great deal of concern in India about the balkanizing effect of this decision. To combat what were called 'fissiparous tendencies' Hindi – a Sanskritized form of Hindustani – was chosen to be the bridging national language. However, the states in southern India, whose languages belong to an entirely different family, strongly objected. As happens in many mosaic societies, the resulting compromise piled on languages in the educational system. The medium of instruction in the primary school was to be the local language, with various other languages added in secondary and higher education, serving as either media of instruction or as subjects of study. India's compromise was called the Three Language Formula – in primary school the local language would be used; in secondary school Hindi, English, and the regional language would be taught. In the Hindi area in the north, another regional or European language was to be substituted. As yet this policy has not been rigorously applied and, *de facto*, the local languages still seem dominant with English serving as the bridge language. While such compromises mitigate political difficulties in mosaic countries, the problem of governmental communication remains, particularly which languages can be used in governmental affairs. This usually requires the adoption of one or a few working languages, or allowing the use of many languages but providing a mechanism for interpretation and translation (Itagi and Singh, 2002).

The People's Republic of China essentially continued a 2000-year old tradition for Chinese languages by continuing the ideology that they were all dialects, united by their single writing system (Zhou, 2004). Language management then became a matter of finding a way to simplify the characters, supplement them with a more or less phonetic alphabet, and encourage a shift to Putonghua, the variety of Mandarin based on the Beijing dialect. For the non-Chinese languages, the initial policy was based on the Soviet model, with the development of literacy in and recognition of a manageable number of varieties, originally (as in the Soviet approach) selecting one dialect as the basis of standardization. There was, however, no effort to force them to accept the Chinese writing system, but rather acceptance of various traditional scripts or use of modified Roman or Cyrillic

alphabets. At one period, there was a strong effort to assimilate these groups, too, linguistically as well as culturally, but more recently, there is an acceptance of bilingual solutions for the larger languages (Zhou, 2003).

Most African nations are afflicted with the effect of the lack of congruence between imperially established and tribal or linguistic boundaries. They generally include many languages, many of which are spoken by large numbers in bordering states. In former French colonies, the position of French as language of government and advanced education is well established (Salhi, 2002), in spite of efforts in North Africa to establish the status of Arabic (Daoud, 2001). Portuguese, too, remains dominant in former Portuguese colonies, though in some countries Creoles are developing and becoming important (Vilela, 2002). In West Africa, Bamgbose (2000) complains, there are national language policies that do not reflect an understanding of local linguistic practices and that are seldom seriously implemented. Illiteracy rates are high; colonial language policies mainly remain in effect. In Botswana, Nyati-Ramahobo (2000) reports, the indigenous languages other than Setswana have been ignored or discouraged, and English is favored over it in government and education. Summarizing the current status in Africa, Batibo (2004) notes that only 2 countries (Egypt and Libya) have adopted indigenous languages as their official medium, 8 use an indigenous language alongside an ex-colonial language, 27 use an ex-colonial language with some symbolic secondary use of an indigenous language, and 18 have ex-colonial languages as the only official national language. In other words, 80% have failed in any efforts to establish indigenous languages as official languages. Two countries that use indigenous languages in the school system, Botswana and Tanzania, require its use by all students, whatever their mother tongue. Many are hopeful that the recognition of a number of indigenous languages in the South African constitution alongside English and Afrikaans will lead to multilingual policies (Kamwangamalu, 2000; Mesthrie, 2002), but studies are suggesting how slow the process is (Heugh, 2003).

This same problem of mosaic societies is not limited to single countries, but faces international organizations with sovereign states as members who must communicate in multilingual contexts. The Council of Europe, for instance, now has 45 member states. It has adopted French and English as its official languages of communication. The United Nations publishes its daily journal in English and French, but has six 'working languages' in which official statements may be made: Arabic, Chinese, English, French, Russian, and Spanish. If a delegation wants

to communicate in another language, it must provide translators and interpreters. The European Union provides for translation and interpretation among the languages of all its members, requiring about 200 simultaneous translators for a single session if all possible language pairs are to be covered.

The issue of language policy in international organizations with their presumption of equality among the languages of member states illustrates the more general problem of the tension between status considerations in language choice and the need to make communication in multilingual contexts effective (Ammon, 2002; de Swaan, 1999; Van Els, 2001). The *de facto* primacy of English as the language of communication is not without its critics (Phillipson, 2003). Elsewhere, when the need for international communication is paramount, the trend is to use English as the common language. For instance, 85% of the citations in the world's scientific literature are published in English (Garfield and Alfred, 1990). While the multilingual capacity of the computer and the Internet has belied the prediction that only English would be used, the pressure for English appears to continue unabated. The growing predominance of English in international communication, of course, is a major handicap to speakers of other languages, and there are numerous attempts such as 'English as a Lingua Franca' or 'World English' to modify the language to make it more accessible to non-native speakers. The perennial attempts to foster the use of Esperanto serve the same purpose.

Foreign Language Teaching Policies

There is some overlap in language teaching policy between domestic and foreign languages. For instance, French is both a domestic and foreign language in Canada, as are French and English in many ex-colonial countries. However, in the main, foreign language policies are usually quite distinct from, and less developed and conflicted than, policies with respect to national language(s) and those of intra-country minorities. They also tend to be given less attention in scholarly analyses of language policy. In addition, such policies tend to be piecemeal rather than coordinated. Only a few overall national foreign language teaching policies have been adopted. The national plan for The Netherlands (van Els, 1992) is one of the few that were based upon surveys of adult use and national need. Australia's national policy statement (Lo Bianco, 1987) included policies with respect to indigenous peoples and immigrants as well as foreign languages. Comprehensive national policy in England was until recently either expressed as part of official

curricula for all instruction, or is addressed by non-governmental organizations (Moys, 1998), including a new policy document developed from the 2000 Nuffield Report (Department for Education and Skills, 2004). Foreign language policy normally relates only to the educational system, although France and Egypt try to limit the use of English outside the educational system. Within the education system, there are a number of common issues that foreign language policy must face (Bergentoft, 1994).

One basic decision concerns the proportionate role of foreign language instruction in the curriculum. In most mosaic countries, the promotion of multilingualism in intra-country languages and perhaps the colonial language leaves little time for foreign languages. The study of foreign languages is most fully developed in Western Europe, where statutory mandates usually require the study of one, and in most countries, two, foreign languages. It appears that the reason for a two-foreign-language policy is to ensure that languages other than English, which is almost always the first choice, are included. Language study may take up a substantial proportion of curricular time. In Sweden, for instance, language study may absorb 15% of total curricular time. In Luxembourg, where French, German, English, in addition to Luxemburgish, are required, the proportion of time taken up in language study is much higher.

Time spent on foreign language study is generally less in the English-speaking countries (Moys, 1998). In the United States, although some state governments which have authority over education do mandate the teaching of foreign languages, the decision on how much foreign language should be offered is usually left to individual districts and schools. All 50 states include the study of foreign languages in their secondary school curricula, although no state requires the study of foreign language in secondary school as a graduation requirement for all students, and only ten states require language study for college-bound students. Unlike other countries, in the United States students may start their language study in higher educational institutions. In 2002, there were 1.4 million students enrolled in foreign language classes in 780 colleges and universities. However, unlike other countries where students enroll in foreign language study in primary school and continue throughout secondary school, enrollments in the United States foreign language classes tend to start in secondary school or college, and drop on the average by half from one language course level to the next. In many countries there is an increasing tendency to start language study earlier and earlier in primary schools, but the practice is still uncommon in the United States. In England, where

a decision was made to drop the requirement for foreign language study after the age of fourteen in comprehensive schools, and in the United States, where budgetary pressures became intense, the number of foreign language courses dropped precipitously.

Foreign language teaching policy specifies which languages are to be studied and in what order of priority. This choice is determined by government fiat in some countries. In many countries, however, school and student choices are primary. In England, and formerly in the United States, the traditional order of language selection for modern languages was French and then German. In the United States, Spanish has become the overall favorite, with French and German in steep decline. French, a language spoken in a country a short journey away, remains the favorite in England. In the other countries of Western Europe, the language chosen after English is likely to be German, followed by French and Spanish. In almost all non-English speaking countries that require foreign language study, the first language to be studied is English, selected by eighty per cent or more of the students, often starting in primary school (Bergentoft, 1994). In the United States, federal governmental support, provided during the Cold War for the teaching of Russian, now promotes the study of the languages of Asia and the Middle East at the higher education level; this support has been boosted since 9/11. Except for instruction specifically aimed at immigrants, Asian languages are seldom taught in countries outside of their home regions.

While some countries specify the method of teaching in language classrooms, in the main, the choice of style of classroom instruction is left to teachers, school districts, and textbook publishers. Indeed, the general trend is away from centralized control of language education to more localized and individual teacher decisions. There are, however, some general trends in the style of language teaching that are taking place in most countries. Particularly in Europe there has been a tendency toward the adoption of what is called communicative competence-oriented language instruction and the primacy of oracy over reading and writing skills. Moreover, the Council of Europe has been instrumental in bringing about a modernization and uniformity in language teaching in many countries. In the early 1990s, what was referred to as the Threshold Level (van Ek, 1975) was introduced by the Council of Europe. It provided specific communicative competence goals that students were expected to achieve. The Threshold Level has been adopted throughout Europe for the teaching of 20 languages, and more advanced levels have been described (Ek and Trim, 1991, 2001). The Council also

provided to its members a widely adopted series of guidelines for everything from teacher training, elementary school language instruction, and language education for vocational students. The European Union supported research throughout Europe on improvement of foreign language teaching and provided advice on general language instructional strategies to all of its member states (European Commission, 1997).

Much of the control of the nature of foreign language instruction lies with the adoption of uniform strategies for assessment. In this regard, once again the international organizations in Europe have been helpful. The Council of Europe developed a set of language assessment standards, the Common European Framework (Council of Europe, 2001) intended to promote a degree of uniformity among its members, with a goal of facilitating the growing practice of student exchanges (Scharer and North, 1992). These standards have been widely adopted throughout Europe and are influential elsewhere. In the United States the most important, indeed the only, national attempt to make uniform policy for foreign language instruction is the development of a set of standards for a substantial number of languages. Developed by a teachers' organization, the American Council on the Teaching of Foreign Languages, the ACTFL guidelines (American Council on the Teaching of Foreign Languages, 1986) has had a major effect on the modernizing of foreign language instruction throughout the United States.

In China, after the end of the Cultural Revolution and even more with the access to the World Trade Organization, there has been a centrally mandated increase in foreign language teaching, with an emphasis now on English (as opposed to an earlier emphasis on Russian) but with a wide choice of other languages. Methodology, too, is being revised, with a new concern for oral language and for humanistic approaches.

Conclusion

In summary, both the development and analysis of language policy have grown immensely in the past several decades. Earlier interest in corpus management has now been overshadowed by a surge of interest in status policy, particularly as it relates to the rights of territorial, regional, and aboriginal minorities. There has also been an increase of interest in language acquisition policy, but it still receives less attention and is almost entirely unrelated to the rest of language policy. However, anyone following the topic in the world's press can usually find two or three stories about language policy a day, and scholarly

activity is fast expanding in order to keep up. It seems safe to predict that the study of language policy in general will continue to develop rapidly.

Language Policy in Multinational Educational Contexts

S Romaine, University of Oxford, Oxford, UK

© 2006 Elsevier Ltd. All rights reserved.

Global Distribution of Multilingualism

Bilingualism and multilingualism are a normal and unremarkable necessity of everyday life for the majority of the world's population. Linguists estimate that there are roughly 6800 languages in the world,

but only about 200 nation-states. With more than 30 times as many languages as there are countries, bilingualism or multilingualism is present in practically every country in the world, whether it is officially recognized or not (Romaine, 1995). This means that in a broad sense multilingual educational contexts can be understood to encompass the educational practices of most countries in the world. The varied cultural and linguistic contexts existing in contemporary societies around the globe pose

complex challenges for policy makers in many areas. The centrality of language to education means that policies concerning choice of which language(s) to use as the medium of instruction are essential, even if the need is not always overtly acknowledged. In addition, the need for teaching of additional languages as subjects is widely recognized as schools have a critical role to play in providing the bi- and multilingual skills that have become increasingly necessary in the modern world. In this article the terms 'bilingualism' and 'multilingualism' will be used interchangeably to refer to the routine use of two or more languages in a community (*see Bilingualism*).

Despite the near-universal presence of more than one language in every country, the global distribution of linguistic diversity is strikingly uneven. Papua New Guinea alone contains 13.2% of the world's languages, but only 0.1% of the world's population and 0.4% of the world's land area. The overall ratio of languages to people is only about 1 to 5000. If this ratio were repeated in the United States, there would be 50 000 languages spoken there (Nettle and Romaine, 2000). Over 70% of all the world's languages are found in just 20 nation-states, among them some of the poorest countries in the world. They include Papua New Guinea (823), Indonesia (726), Nigeria (505), India (387), Mexico (295), Cameroon (279), Australia (235), the Democratic Republic of Congo (218), Brazil (192), United States (175), the Philippines (169), Malaysia (139), Tanzania (135), Vanuatu (109), Russia (100), Vietnam (93), Laos (82), Ivory Coast (77), Ghana (79), and Solomon Islands (69). These data come from the *Ethnologue*, a database compiled by SIL International.

Need for Language Policy and Planning

The pervasive presence of some degree of multilingualism indicates a universal need for language policy and planning in order to ensure that members of different language groups within a country or other administrative unit have access to and can participate in important societal institutions such as schools, government, and media (*see Language Planning and Policy: Models*). Schooling is one of the most critical sites for planning because education is the primary societal institution through which legitimation for the state's dominant language is sought. Formal education is often the first point of contact children have with the world outside their own community. Speakers of languages other than the official and national languages recognized for instructional purposes are often at a disadvantage. The poor school achievement of minority group

children due to discontinuities between home and school language is well documented (Corson, 1990; Tollefson, 1995).

The first sociolinguists to tackle questions of language policy and planning were concerned with the language problems of developing nations such as Malaysia and India (Fishman *et al.*, 1968). Many countries under former colonial rule designated the colonial language as their sole official language for education and government. Ivory Coast, for example, declared French as its official language. Some have in addition specified national languages which may be compulsory in education. Others such as Indonesia replaced the former colonial language with their own.

From the 1970s onward, scholars have been concerned with education in migration contexts, particularly in Europe, which has seen the rise of increasingly diverse populations in countries such as Portugal and Iceland, often cited as examples of monolingual nations. The illusion of linguistic homogeneity is belied by the existence of a number of minorities in both these places. Portugal has a population of about 10 000 speakers of Mirandese (Miranda do Douro) concentrated in small villages in the northeastern part of the country. Because both Portuguese and Mirandese are closely related Romance languages, Mirandese has been thought of as a dialect of Portuguese. However, in 1999 the Portuguese parliament recognized it as a regional minority language and has undertaken some steps to protect it. It is optionally taught in some local schools, and work on grammars and dictionaries is under way. Portugal also has large numbers of immigrants from its former colonies (Angola, Mozambique, Guinea-Bissau, Cape Verde, São Tomé and Príncipe, East Timor, and Brazil). There may be as many as a quarter of a million 'new' immigrants (many of them illegal) from eastern Europe, especially Ukraine and Russia. Immigrants now comprise about 5% of the population, one of the highest proportions in the European Union, up from less than 2% at the turn of the 21st century. Iceland too has witnessed an influx of immigrants from Asia, especially since the 1990s, in addition to those coming from European countries. Although only around 3% of the population is non-Icelandic in origin, as many as 40 different languages may be spoken in addition to Icelandic.

An even more recent area of concern has been the notion of language rights, as individual and collective rights of persons belonging to linguistic minorities have been increasingly acknowledged in international human rights law and encoded in various legal instruments (May, 2001; Skutnabb-Kangas and Phillipson, 1994).

Components of Language Policy

Spolsky (2004: 5) distinguished three components of language policy: language practices, language beliefs or ideology, and language planning. The notion of language practices concerns the choices members of a community make among the varieties available for use. Consider, for instance, the many Haitians or Cubans who have immigrated to cities such as Miami, who may use English to varying degrees in addition to Haitian Creole French or Spanish. Or consider Saami speakers in Norway, who may know Saami (an indigenous language of northern Norway, Sweden, and Finland), Norwegian, and English to varying degrees. Language beliefs include attitudes toward and beliefs about these varieties. Until recently attitudes toward Saami have been quite negative, among both Saami and non-Saami. Majority populations often show little enthusiasm for the languages of immigrant minorities either, even when the language concerned is a world language such as Spanish (as is the case in the United States) or Arabic (the language of many immigrants in France and the Netherlands). This is due to status differences between the majority and minority populations. Distinctive food, dress, song, etc. are often accepted and allowed to be part of the mainstream, but language much less so. The idea that linguistic rights need protection has never been part of American culture, and so they have not been seen as central to U.S. courts unless allied with more fundamental rights such as educational equity, etc. (Schiffman, 1996).

Language planning includes any efforts to modify practices or beliefs by means of some form of management or intervention. It usually takes the form of a set of planned and managed interventions supported and enforced by law and implemented by official government agencies. Many countries encode language policies of one sort or another in their constitutions, laws, or other official documents. UNESCO sponsors the MOST (Management of Social Transformations) Clearing House on Linguistic Rights, designed to provide information for legislators, decision makers, researchers, and other representatives of both governmental and nongovernmental organizations. The database provides an overview of the most important international legal instruments, major nongovernmental documents, and national constitutions containing provisions relating to language and the rights of linguistic minorities, and a bibliography on linguistic rights in international human rights law (*see Law and Language: Overview*). In conjunction with other sources of data (Skutnabb-Kangas, 2000: 297–311), this information can be used for further sociolinguistic analysis as well as for the development of multilingual policies.

The MOST database lists 163 constitutions containing some mention of language; 22 countries either have no constitution at all or have a constitution that contains no provisions relating to language. Perhaps the most common kind of provision is to declare a language or languages as official or co-official, or as a national language. Nevertheless, fewer than 4% of the world's languages have any kind of official status in the countries where they are spoken. The fact that most languages are unwritten, not recognized officially, restricted to local community and home functions, and spoken by very small groups of people reflects the balance of power in the global linguistic marketplace. Around 100 constitutions specify one or more official or national languages with special privileges of use. Seventy-eight mention a single official or national language. The constitution of France says that "the language of the Republic shall be French."

More than 20 countries have more than one official language. India, for instance, has 19 and South Africa has 11. The constitution of Vanuatu states that the national language is Bislama, and the official languages are Bislama, English, and French. The principal languages of education, however, are English and French. India's constitution codifies a variety of provisions protecting linguistic minorities, including the right to establish and administer educational institutions of their choice, and freedom from discrimination on grounds of language. In addition to specifying Hindi as the official language, it grants rights to regional state languages and specifies which languages can be used for communication between states, and between states and the national government. Every state is supposed to endeavor to provide adequate facilities for instruction in the mother tongue at primary level to children belonging to linguistic minority groups, and there is a provision establishing a Special Officer for Linguistic Minorities. When a language is spoken by 30% or more of the population in any state or district, it is recognized as bilingual and the relevant minority language is placed on the same footing as the regional language for use by public authorities.

In practice, no country gives official status to every single language spoken within its territory. Where language policies exist, they inevitably privilege a limited set of languages. Even where explicit policies do not exist, governments have to operate in some language(s). This means that policy is implicit even if no specific mention is made of language. Here is where an examination of practice is essential. The presence of many languages other than English in industrialized countries such as the United States and Australia often comes as a surprise because these

countries have generally operated and seen themselves as largely monolingual English nations, despite the presence of a considerable number of indigenous and (im)migrant communities using other languages. The United States is a classic example of a country with no official language policy. The term 'benign neglect' is sometimes used to describe cases where a state has no codified policy specifying which languages are official. Nevertheless, when a multilingual country uses one or more languages exclusively in public schools, and in the administration of state services and activities, it is making a distinction based on language. In showing a preference for some language(s), whether designated as official or national or not, the state's decision benefits those for whom the chosen language(s) is a primary language, to the detriment or disadvantage of others who either have no or lower proficiency and are denied the benefit or privilege of using their own primary language. The only cases where immigrant and indigenous minorities receive equal treatment are in those countries where neither group is given any special status (Kymlicka and Patten, 2003).

The term '*de facto*' ('by fact') is used for policies that operate covertly, implicitly, without necessarily having any official written support in legal documents. '*De jure*' ('by law') policies are overt, explicit, officially and legally defined. Probably most majority languages dominate in many domains where they have only *de facto* and no legal status. English is the dominant *de facto* or official language in over 70 countries. French has official or co-official status in 29 countries. The majority of countries in the world operate either *de facto* or *de jure* as monolingual states in recognizing only one language for use in education. This does not always mean that no other languages are used in education, but rather that they do not have official status. Again one must look to practice in individual cases to assess the situation.

Language Policies in Nation-States

The nation-state is the most critical unit of analysis because it is the policies pursued within national boundaries that gives some languages (and their speakers) the status of majority and others that of minority language. The term 'minority' is ambiguous because it may have both numerical and social/political dimensions. It is generally a euphemism for nonelite or subordinate groups, whether they constitute a numerical majority or minority in relation to some other group that is politically and socially dominant. What is common to most minority languages from a sociopolitical perspective is the fact that their status is defined in relation to some

administrative unit, which in the modern world is generally the nation-state. Mandarin Chinese, with 900 million speakers, is spoken by more people than any other language in the world. In China, it has the status of majority language, but in many other countries such as Malaysia, it is a minority language. Catalan (Catalan-Valencian-Balear) is spoken by a minority of people within Spain, but by a majority in Catalonia, where it has official recognition. A minority language in a large country may be a majority language in a smaller country. Some languages, such as the signed languages used among deaf speakers, are minority languages in all contexts (see **Minorities and Language**).

The linguistic heterogeneity of many countries reflects the linguistic arbitrariness of shifting political boundaries that have encapsulated distinct ethnic groups or nationalities with their own languages. All nation-states, whatever their political ideology, have persecuted minorities in the past and many continue to do so today. Many indigenous people today such as the Welsh and the Basques find themselves living in nations that they had no say in creating and are controlled by groups who do not represent their interests and in some cases actively seek to exterminate them. More than 80% of the conflicts in the world today are between nation-states and minority peoples (Clay, 1990). The Chechens, for example, lost at least one-quarter and perhaps half of their population in transit when they were deported *en masse* to Kazakhstan and Siberia in 1944. In 1957 they were allowed to return to their ancestral territory. In the face of continued Chechen rebellion to Russian appropriation of their land, economic resources, and a continued denial of civil rights, in late 1992 Russia sent tanks and troops to the north Caucasus, ostensibly as peacekeepers in an ethnic dispute.

While not all states are actively seeking the eradication of minorities within their borders, they have pursued policies designed to assimilate minorities into the mainstream or dominant culture. It was not too long ago that minority children in places such as Australia, the United States, Britain, and Scandinavia were subject to physical violence in school for speaking their home language. Often the education of these children entailed removing them from their parents and their own cultural group. The Statutes of Iona in Scotland, dating from 1609, are among the early instances of legislation in present day U.K. designed to promote linguistic and cultural assimilation. The statutes had the expressed purpose of separating Highland children from their native Gaelic culture and language and educating them in English in the Lowlands, where they would not only learn the dominant language, but would do so in an alien

cultural and linguistic environment where their own culture was seen as barbaric. The law required the chiefs to send their eldest child to the Lowlands to be educated until they could speak, read, and write English.

In North America native children were sent to boarding schools where their own languages were forbidden. In Canada, the federal government and churches entered into a formal partnership to run a residential school system for Indian and Inuit children as part of the assimilation policy of the Canadian government. Education in such church-run, government-funded residential schools was supposed to prepare children for life in white society by denying them their native identity. The residential school system was in operation for nearly 150 years. In some parts of Canada as many as five generations of children attended, and some communities were depopulated of children between the ages of 5 and 20. Such schooling produced a collective sense of shame about native languages and identities. It is not surprising that demands for some form of bilingual education emerge when a group feels it is being discriminated against on other grounds. In a study done of 46 linguistic minorities in 14 European countries, the clearest link to emerge between language and schooling is that a minority language which is not taught tends to decline (Allardt, 1979).

The borders of most countries are often linguistically diverse areas. Due to a variety of political and historical factors, bilinguals may be concentrated in particular geographic areas constituting regions where the use of a language other than the state language is normal. The northeastern corner of Italy shares a border with Slovenia to the east and Austria to the north. It contains a substantial population speaking either Slovenian, as well as Friulian (more closely related to Provençal than to standard Italian), or German (Standard German). Sauris is in effect a German linguistic island severed from the Austrian empire and incorporated into the Italian state. The region of Trentino-Alto Adige (Südtirol), governed by a special statute giving equal status to German (Standard German) and Italian, guarantees the right to education in the mother tongue for Germans in the province (from nursery to higher level). Italian is taught as a second language starting from the second year of the elementary cycle. Friulian is one of the largest minority languages of Italy, with over half a million speakers in the region of Friuli-Venezia-Giulia. A regional act of April 1993 provided funds for the promotion of Friulian in primary schools. Friulian is also used in some bilingual preschool education in the province of Udine. In the south and on the east coast, Greek and Albanian are spoken in

some communities by descendants of refugees and mercenaries. Neither Greek nor Albanian has any official status, although the languages are taught in a small number of schools.

Although Article 6 of the Italian constitution is a clause pertaining to linguistic minorities which states that the republic protects linguistic minorities by special laws, there are discrepancies between policy and practice. Many minorities do not benefit from any special provisions. There are approximately one million speakers of Sardinian, which has no official recognition, despite the fact that Sardinia is an autonomous region governed by special statutes. Sardinian may be used in preprimary schools if needed to communicate with children. At the primary and secondary levels Sardinian has recently been introduced as a separate subject on an experimental basis.

In some countries decisions about language policy follow a 'personality' or 'territory' principle. In Switzerland territorial unilingualism exists under federal multilingualism in the country's four officially declared national languages: German, French, Italian, and Romansch. Of the 26 cantons, 22 are officially monolingual, with one of the four languages functioning as the dominant language in education. English is much preferred over the other official languages as a second language learned at school. Canada follows the personality principle for its two official languages, French and English, where sufficient numbers warrant. Quebec gives a universal right to French education, but the right to English education is limited to those with at least one parent educated in English.

Language Policy beyond the Nation-State

Many nation-states are similar to Italy in their incorporation of a number of groups with distinct languages, and their recognition of only one or a few languages for use within the education system and for other societal institutions. As the official language of Italy, Italian is also recognized beyond its national borders as an official language of the European Union (EU). Europe is perhaps unique in having such a large concentration of world languages within its borders as well as a sizable number of minority languages. From its beginning as the European Economic Community, the EU has accorded official status to each of the national languages of its member states. This means that relatively small national languages such as Danish, with roughly five million speakers, and Greek are, in principle, as official community languages on an equal footing with international languages such as French and English, a status they have nowhere else in the world. Outside the

EU and its own borders, Danish has a similar status only in the Nordic Parliament, and, like Greek, it is not spoken at international gatherings. As embodied in its linguistic policy, this has meant that equality of access to the EU's institutions should not be hindered by language. In 1990 the European Parliament adopted its so-called 'principle of complete multilingualism,' which it declared to be "consistent with the respect which is owed to the dignity of all languages which reflect and express the cultures of the different peoples who make up the European community." However, from the beginning not all languages have been equal; nor in the larger sense was or could multilingualism ever be 'complete.' This resolution was adopted due to pressure in support of granting Catalan some sort of official standing in the EU's operations.

The case of Catalan is indicative of the fact that many minority languages, both indigenous and non-indigenous, are not recognized either as official or as working languages, even though some of them have larger numbers of speakers than do the national languages. Thus, Catalan with its roughly six million speakers, despite having more speakers than Danish, was not an official language because the country in which it was officially recognized, Andorra, is not a member of the EU. In the member states where it is spoken, France, Spain and Italy, it does not have official status. While denying official status to some languages like Catalan, the regulations of the EU have continually been expanded to accommodate the entrance of new member states with their national languages. In 2004 the EU expanded from 15 countries with 11 official languages to 25 countries with 20 official languages.

The EU has undertaken legislation to defend the status of certain minority language communities within its borders in the form of the European Charter for Regional and Minority Languages (1992). Although it specifies no list of actual languages, the languages concerned must belong to the European cultural tradition (which excludes 'immigrant' languages), have a territorial base (which excludes languages such as Yiddish [Western Yiddish] and Romany [Romani], used over a wide geographic area), and be a separate language identifiable as such (which excludes local dialects of the official or majority languages). The terms of reference are deliberately vague in order to leave open to each member state how to define cultural heritage and territory. The charter provides a large number of different actions that state parties can take to protect and promote historical regional and minority languages, from which states must agree to undertake at least 35. However, each state is free to name the languages

which it accepts as being within the scope of the charter (Ó Riagáin, 1998). The U.K., for instance, ratified the treaty in March 2001, but did not include Manx and Cornish. Mercator Education maintains a database of information relating to the use of regional and minority languages in education.

Language planning on an even more limited regional basis clearly makes better sense for languages such as Saami, Basque, Catalan (Catalan-Valencian-Balear), and other languages cutting across national boundaries, but the EU has generally avoided taking any action which would interfere with national laws or policies concerning linguistic minorities. The result is that many languages are valued only beyond their national borders, while not being recognized for educational or other public purposes even within their own areas of concentration.

Language Policies at the International Level

The issue of language in education has been central to the mandate of UNESCO because one of its goals is to achieve universal quality primary education and a 50% increase in adult literacy by the year 2015. Established in 1945 as a special agency of the United Nations, the organization promotes international cooperation among its 190 member states and six associated members in the fields of education, science and culture. It aims to be a standard setter in forging international agreements on a variety of ethical issues. In 1953 UNESCO published an expert report on the use of vernacular languages in education, whose recommendations are still considered to be a central reference and have been widely referred to.

Nevertheless, UNESCO's (1935:6) much-cited axiom "that the best medium for teaching is the mother tongue of the pupil" did not lead to any widespread adoption and development of vernacular languages as media of education. Despite some encouraging developments in some countries, in most parts of the world schooling is still virtually synonymous with learning a second language. Brenzinger (1998) estimated that fewer than 10% of African languages are included in bilingual education programs, with the result that more than 1000 African languages receive no consideration in the education sector. Skutnabb-Kangas (2000) maintained that education for minorities in many parts of the world still operates in ways that contradict best practices. She estimated that fewer than 10% of the world's languages are used in education.

In 2003 UNESCO published a new position paper on languages and education reflecting the changing global context for education in a multilingual world

(see **Education in a Multilingual Society**). The recommendations included choice of the language of instruction in multilingual contexts; the need to preserve the languages and the ethnic identities of small language groups; and the role of English as the lingua franca and the language of instruction in countries where it is not a native language. These concerns grew out of recognition of education as an important tool and reflection of cultural diversity in a rapidly changing world.

The changing character of multilingualism in the world today has manifested itself in at least two patterns. The first is that over the last few centuries in particular, some languages have shown a remarkable propensity to spread. Speakers of the 10 largest languages make up about half the world's population, and this figure is increasing. The 100 largest languages account for 90% of all people, with the remaining 6000-some confined to ten percent of the world's most marginalized peoples, who have generally been on the retreat for several hundred years (see **Endangered Languages**). European colonization of the New World created many such language spreads, and most of the largest European languages are also widely spoken outside Europe. Today an Indo-European language, either English, French, Spanish or Portuguese, is the dominant language and culture in every country in North, Central and South America (Nettle and Romaine, 2000).

A second noteworthy trend is increasing bilingualism in a metropolitan language, particularly English, which has become the language of the 'global village.' No one knows exactly how many people speak English as a first or second language, but some estimates for the former group are 375 million; for the latter group, some figures run as high as 1.5 billion (roughly a quarter of the world's population). As the world's economy has shifted from an industrial base to one based on exchange of information, the globalizing new world order is founded on communications technology, which underlies the linking of national economies. Hence the role of language and communication is destined to play a more critical role than ever before (see **Languages of Wider Communication**). Because the technology facilitating these developments originated largely in the English-speaking world, English is at the leading edge of global scientific and economic development. As much as 80% of the information stored in the world's computers is in English and 90% of the world's computers connected to the Internet are located in English-speaking countries. English is now the most widely used language in publication, with over 28% of the world's books printed in English and over 60 countries publishing books in English. English is also the language of international air traffic control and the basis for Seaspeak, used

in international maritime communication. Crystal (1997) estimated that 85% of international organizations use English as one of their working languages, among them the United Nations and its subsidiary organs. French is the only real rival to English in this arena and it has been continually losing ground. Virtually all major corporations advertise their products in English. English is also the language of international popular culture for today's youth.

Most people in northern European countries such as the Netherlands, Germany, and the Scandinavian countries are becoming bilingual in English at an increasingly earlier age through schooling. Soon there will be few monolinguals among their school-age populations. English has rapidly become the first preferred foreign language study at school in the European Union, with nearly 90% of students studying it. French is almost always the second most widely taught language. The teaching of one or more foreign languages in primary school has also become more widespread.

Many countries have changed their educational practices regarding the teaching of foreign languages as a response to increasing demand for English. In Iceland, for instance, English has replaced Danish as the first foreign language taught in compulsory education (i.e., primary and lower secondary) in the new national curriculum. Danish is still taught as a compulsory second language to maintain and strengthen ties and cooperation with other Nordic countries. English instruction begins at age 10 (the fifth year of schooling) and is taught for 6 years, while Danish begins at age 12 and is taught for 4 years. During the last two years of lower secondary schooling students generally have the option of learning a third foreign language, usually German (Standard German), but Spanish and French in some cases. The national curriculum guidelines also prescribe a minimum number of hours per week of foreign language instruction. These are rather low: 16 hours per week in English over a 6 year period, 14 for Danish, and only 2 hours per week in the optional third foreign language. Foreign languages are generally not used as the medium of instruction.

In other parts of the world English has rapidly replaced other languages once widely taught as second languages. Under the Soviet regime Russian was imposed in schools throughout the former Soviet bloc. After disintegration of the Soviet Union, few countries besides Russia require students to learn it, with the result that the language is less and less used.

Meanwhile, a third trend is that immigration and migration have brought about increasing linguistic and cultural diversity in much of Europe as well as the United States and other parts of the globe (see **Migration and Language**). At the end of the 20th century one-third of the urban population in

Europe under the age of 35 was composed of ethnic minorities, the result of widespread migration in the 1950s and 1960s when Europe experienced an acute labor shortage. Around 10% of the school age population already has a culture and language different from that of the majority of the country in which they reside (Extra and Verhoeven, 1999). London has become an increasingly diverse city with as many as 200 languages spoken in its schools as a result of the influx of overseas migrants from the Caribbean and Asia. Similarly, Melbourne, once primarily a monolingual city, now has the largest concentration of Greek speakers in the world.

At the beginning of the 20th century one in eight persons in the United States was nonwhite; by the end of the century the proportion had increased to one in four. The white population also grew more slowly than any other group in the latter half of the 20th century. From 1980 to 2000 the Hispanic population in the United States doubled. The U.S. Census 2000 revealed that persons claiming Hispanic or Latino origin have replaced African-Americans as the largest ethnic minority group. A third of California's population belongs to this minority and nearly 40% of its population claims to speak a language other than English at home (Hobbs and Stoops, 2002). The United States is now the fifth largest Hispanic country in the world. Cities such as Miami and Los Angeles are now predominantly hispanophone, and Los Angeles has been Latinized by its continuing immigration from Mexico. In three states, California, New Mexico, and Hawaii, as well as the District of Columbia, minority populations constitute the majority.

Recognizing that issues of identity, power, and nationhood are closely linked to the use of specific languages in the classroom, UNESCO's (2003) position paper on education in multilingual contexts reaffirmed the value of mother tongues, but at the same time stressed the importance of balancing the need for local languages in learning and access to global languages through education. As far as mother tongue teaching is concerned, UNESCO advises that it should cover both teaching of and through this language for as long as possible. Learning through a language other than one's own presents a double burden. Not only must new knowledge be mastered, but another language as well. Many minorities may be disadvantaged to begin with, coming from at-risk populations such as new immigrants, refugees, etc.

Linguistic Human Rights

The UNESCO (2003) position paper also endorsed many of the recommendations that have come out of

the debate about linguistic human rights, which has emerged as an important topic in the context of the education of linguistic minorities (Varennes, 1996; Paulston, 1997; Skutnabb-Kangas, 2000). The notion of linguistic human rights is an attempt to link the debate about language rights with the relatively well-defined international legal framework in existence for human rights. That is, the concept of human rights is invoked as a means of reaching consensus on the rights of linguistic minorities to ensure social justice. These include the rights of indigenous and minority groups to education in their own language, access to the language of the larger community and that of the national education system, and international languages (see King and Schielmann, 2004). Discussion of a universal declaration of linguistic rights is taking place under the auspices of UNESCO. Such legislation aims at guaranteeing at an individual level that everybody can identify with their mother tongue(s) and have this identification accepted and respected by others, and can learn the mother tongue(s) fully, orally (when physiologically possible) and in writing. In most cases, this requires that indigenous and minority children be educated through the medium of their mother tongue(s); that they can use the mother tongue(s) in official situations (including schools); that everybody whose mother tongue is not an official language in the country where they are resident can become bilingual (or multilingual, if they have more than one mother tongue) in the mother tongue(s) and (one of) the official language(s) (according to their own choice).

In practice, this is being achieved to some degree in some contexts, often by means of what has been called a 'three-language formula' or a '3 ± 1 language formula' in education (see **Education in a Multilingual Society**). In India a three-language policy means that children from non-Hindi-speaking areas study their regional language, in addition to Hindi, and English. Hindi speakers, on the other hand, study Hindi, English, and another language. In each state there is generally a large population who speak the dominant language of the neighboring state in addition to the dominant language of the state in which they reside. In Andhra Pradesh the dominant language is Telugu (Telugu), but many people speak Kannada, Marathi, and Tamil. Millions of Telugu speakers reside in the states of Karnataka, Orissa, Tamil Nadu and Maharashtra. Each state is multilingual and the linguistic majority in one state may be a minority in other states. Each state usually recognizes one official language and restricts the use of other languages to particular districts within the state. Critics of the policy contend that although it sounds fine in theory, in practice it has not been followed throughout the country.

In Luxembourg trilingualism in the national language, Luxembourgish or Lëtzebuergesch (Luxembourgish), French, and German (spoken in the neighboring countries of Belgium, France, and Germany) is encoded in legislation which ensures that all citizens learn all three languages at school. Students begin with their everyday spoken language, Luxembourgish, in compulsory preschool education. German is added in the first year of primary education, and French from the second year of primary school onward. Over the years, however, and particularly in secondary education, French gets an ever-bigger share until it completely replaces German as the language of instruction. English is learned as a fourth compulsory language in secondary education and secondary technical education.

Kymlicka and Patten (2003: 7) claimed that one reason why there has been a general reluctance to view policies of official bilingualism as rights rather than as pragmatic accommodations is that public institutions in the most powerful Western nations, the U.K., the United States, France, and Germany, have been monolingual for a century or more with no significant movement toward challenging the hegemonic position of the majority language. Immigrants have not generally challenged the hegemony of these nations and have usually assimilated rapidly and none of these countries has faced the linguistic challenges of Belgium, Spain, Canada, or Switzerland. Language occupies a contested position when nation-states cannot ground their basis for a common identity on language, religion, or culture. Some still regard the concept of language rights as 'regressive' because they are seen as encouraging the persistence of ethnic differences, leading to conflict and divided loyalties. It is an unresolved question whether and when language shift can be required or expected in deliberative democracies (see **Language Maintenance and Shift**). Likewise, one can question whether it is legitimate for the state to insist that all children be schooled in the majority language of the state as the sole or main medium of instruction. National ethnic minorities have many more internationally and nationally coded rights than immigrants. The linguistic human rights movement has focused on securing a universal right to mother tongue primary education.

Typologies and Models of Multilingual Education

Bilingual education is not a modern phenomenon; it has existed in one form or another for at least 5000 years. Only recently, however, has it become an area of concern for policy makers. The term

'bilingual education' can mean different things in different contexts. If we take a commonsense approach and define it as a program where two languages are used equally as media of instruction, many so-called bilingual education programs would not count as such (see **Bilingual Education**). Moreover, the 'same' educational policy can lead to different outcomes, depending on differences in the input variables.

Typologies of bilingual education range from those which distinguish two basic types (Edwards, 1984) to Mackey's (1972) 90-cell typology. In her discussion of these many typologies each with somewhat different terminologies, Hornberger (1991) showed how the same terms are often confusingly used for different types of educational programs and conversely, different terms refer to the same type. So-called transitional bilingual education, for example, is also referred to as compensatory or assimilation bilingualism. Sometimes a distinction is made between immersion and submersion, and often the additional term 'structured immersion' is used for a program that has more in common with submersion than immersion. Like submersion, it is a program of monolingual majority language instruction for minority language speakers with little or no use of the pupils' first language. A so-called maintenance program does not necessarily foster maintenance. Sometimes the term refers to a program's goal, e.g., the maintenance of a minority language, while in other cases, it refers to the structure of a program, e.g., the curricular maintenance of a minority language as a medium of instruction.

Hornberger proposed her own framework, which distinguishes between bilingual education models and program types. Models are defined in terms of their goals with respect to language, culture and society, and program types in terms of characteristics relating to student population, teachers, and program structure. This led her to recognize three types of models, transitional, maintenance, and enrichment, each of which may be implemented via a wide range of program types. Like Hornberger, Skutnabb-Kangas (2000) recognized three general types: immersion, submersion, and maintenance. If the educational aim of a bilingual program is the enrichment of majority children, an immersion program is chosen and the children are taught through the medium of a second language. The type of program chosen will typically, though not always, have different consequences. In practice, the situation in individual countries is complex and often several different options are available for different kinds of children, depending on a variety of circumstances, varying from place to place.

Immersion

Immersion programs first began in Montreal in 1965 to teach French to English-speaking students. Although there are many variants of the model, in most cases the students come from the same home language background, and the curriculum typically involves two or more languages as the medium of instruction. One of these is usually the student's home language, and the other a second or foreign language, with at least 50% of the curriculum being taught through the second or foreign language. The Canadian model can be thought of as leading to 'additive bilingualism' because the aim is to produce a high level of proficiency in both languages. Results have shown that immersion students consistently display normal levels of academic development in their first language while acquiring high levels of proficiency in the second language (*see Bilingualism and Second Language Learning*). Full benefits of immersion emerge after about 5 or 6 years of continuous participation. Early immersion programs tend to achieve better results, but late immersion programs can also be successful (Johnson and Swain, 1997; Cenoz and Genesee, 1998).

After the success of the French immersion programs, similar immersion models of various types have become widely used around the world to promote indigenous and minority languages. Some programs are total immersion, such as the Hawaiian program, which uses Hawaiian as the language across the curriculum. English is introduced as a subject from the fifth grade (around age 10) for 1 hour a day. Most of the students attending are English speakers and are learning Hawaiian as a second language. The immersion model contrasts with more conventional language teaching as a subject for a limited number of hours with fewer opportunities for high levels of academic or informal engagement with the language in use. In immersion there may be little if any focus on language learning *per se* in the form of direct teaching of grammar and vocabulary. Language is acquired through the meaningful interaction required to learn academic content in various subjects. Other variants of the model may rely on bilingual immersion combined with a third language taught as a subject. In parts of the Basque country Basque and Spanish are used for instruction during primary education, and English is taught as a subject beginning in kindergarten.

In other cases, however, total immersion programs have been used as a tool to assimilate linguistic minorities into dominant languages. Minority children are put into majority language classes (with or without

some additional teaching of the second language). Some researchers have called such programs 'submersion' or 'subtractive bilingualism' since the second language gradually undermines proficiency in the first because the development of the child's first language is disrupted and incomplete. In the United States some children have received assimilationist treatment (with or without special instruction in English as a second language), while others have had the opportunity to participate in bilingual programs along with majority children who were being exposed to the first language of the minority group in an enrichment scheme. The types of programs offered to particular groups depend very much on the relationship between them and the government.

Transitional Bilingual Education

Bilingual education was given a legal footing in the United States by the Bilingual Education Act of 1968. Aimed at children with 'limited proficiency in English,' it provided funds for instruction in the mother tongue only as an aid to allow the children to proceed as rapidly as possible into ordinary mainstream classes in the majority language. From the beginning there was conflict over the degree of emphasis to be given to native language instruction. The model of bilingual education prescribed by the federal government, however, was opposed in its aim and principles to the kind of enrichment goals underlying Canadian immersion. Although it provided opportunities for schools to set up bilingual education programs, it did not place individual schools under any legal obligation to do so. Moreover, there was no intention or provision to maintain the students' home language. Instead of receiving equal instruction in both languages as they would in a maintenance program, the students would be given increasingly less instruction in their native language until they finally left the program.

Litigation brought to the courts on behalf of various groups of minority students led in some cases to court-mandated bilingual education programs. In *Lau vs. Nichols* a class action suit was brought against the San Francisco Unified School District by Chinese public school students in 1970. It was argued that no special programs were available to meet the linguistic needs of these students. As a consequence, they were prevented from deriving benefit from instruction in English and were not receiving equal treatment. The plaintiffs made their appeal not on linguistic grounds, but on the basis of the Civil Rights Act of 1964, which states that "no person in the United States shall, on the ground of race, color

or national origin, be excluded from participation in, be denied the benefits of, or be subject to discrimination under any program or activity receiving Federal financial assistance” (Teitelbaum and Hiller, 1977: 6). In their case against the school board, the plaintiffs requested a program of bilingual education. Although the case was lost, the Supreme Court overturned the decision of the federal district court in 1974. It concluded that “the Chinese-speaking minority receives fewer benefits than the English-speaking majority from respondents’ school system which denies them a meaningful opportunity to participate in the educational program – all earmarks of discrimination banned by the regulations” (Teitelbaum and Hiller, 1977: 8). This was a landmark decision because it meant that for the first time in the United States the language rights of non-English speakers were recognized as a civil right. It was one of the few language cases ever to reach the Supreme Court, and its ruling made schools rather than parents or children responsible for remedying the children’s limited knowledge of English.

In its decision the Supreme Court did not press for any specific remedy. It pointed out only two possibilities: namely, teaching English to the students or teaching them in Chinese. They requested only that the school board rectify the situation of inequality of educational opportunity. The remedy taken by the San Francisco school board was to set up a bilingual education program for Chinese, Filipino, and Spanish language groups, who made up over 80% of the students with little or no English. Teaching in English as a second language was offered to all other minority groups. The Lau decision led to other cases. It also encouraged expansion of the services and eligibility provided through the Bilingual Education Act, and many states passed bills mandating bilingual education. The Lau decision was also instrumental in setting up policy guidelines at the federal level that would allow the U.S. Office of Education to decide whether a school district was in compliance with the Civil Rights Act and the Lau case. A document referred to as the ‘Lau Remedies’ directed school boards to identify students with a primary or home language other than English and to assess their proficiency in English and the home language. Elementary school students were to be taught in their dominant language until they were able to benefit from instruction entirely in English. The U.S. Congress made the Lau decision an explicit part of the Equal Educational Opportunities Act (1974). Further mandates for bilingual instruction followed from lawsuits by Latino parents.

The sixth (and final) version of the Bilingual Education Act reauthorized by Congress in 1994

endorsed for the first time the goal of developing native language skills alongside its traditional focus on English language acquisition for limited-English-proficient children. Meanwhile, under the Clinton administration (1993–2001) two-way or dual immersion programs were promoted; these grew more than tenfold between 1987 and 2001. These were aimed at integrating majority and minority children in a program of content and literacy instruction in two languages.

In the late 1990s, however, the tables turned dramatically when a lawsuit was filed on behalf of Latino parents who claimed that state policies mandating Spanish instruction discriminated against their children (Carbajal *et al.* vs. Albuquerque Public Schools, 1999). This case attempted to portray bilingual education as a violation of civil rights rather than an entitlement. In California a conservative software millionaire named Ron Unz spearheaded a movement named English for the Children, portraying itself as a group committed to securing the right to instruction in English for immigrants. Under this proposal children with limited English proficiency were to be ‘mainstreamed’ as soon as possible into regular classrooms. After voters in three states (California in 1998, Arizona in 2000, and Massachusetts in 2002) voted against bilingual education, programs were dismantled, and have been under attack in others. This outcome meant that most of the bilingual education programs enrolling 43% of the English language learners in the United States would be replaced with intensive English immersion.

Ironically, one of the reasons why many people have viewed bilingual education so negatively is due to the fear that it aims to maintain languages, and by implication cultures, other than English. Even at the peak of their existence, bilingual programs reached only a minority of children for whom they could have been beneficial. Voters appeared to be largely ignorant of the rationale behind such programs as well as their aims and outcomes. Crawford’s (2004) analysis suggested that the public had a mistaken view that bilingual education was a diversion from acquiring English rather than a means to that end. It was the idea of maintaining languages other than English which the public was against. While foreign language instruction in the world’s major languages in mainstream schools has been seen as valuable, both economically and culturally, bilingual education for minority students has been equated with poverty and loyalties to nonmainstream culture which threaten the cohesiveness of the state. Voters were also misled by the use of the term ‘English immersion,’ which suggested an intensive English program tailored to the needs of children learning English.

In addition, various opponents of bilingual education have formed a powerful lobby backed by considerable sums of money. The English-only movement formed in 1983, operating under the name U.S. English, has been campaigning in favor of a constitutional amendment to make English the official language of the United States, and for similar legislation at state level. The organization also seeks to repeal laws mandating multilingual ballots and voting materials. Twenty-seven states have enacted some form of official legislation. The group has seen programs that accommodate immigrants in their native languages as a kind of 'linguistic welfare' system that lowers the incentive to learn English and restricts them to low-skilled, low-paying jobs.

In 2002 the Congress effectively repealed the Bilingual Education Act when it passed the 'No Child Left Behind Act.' References to bilingualism have been removed from various federal agencies to reflect the shift away from bilingual education to concentration on the acquisition of English. The Office of Bilingual and Minority Affairs at the U.S. Department of Education was renamed the Office of English Language Acquisition, Language Enhancement and Academic Achievement for Limited English Proficient Students. The National Clearing House for Bilingual Education has been renamed the National Clearing House for English Language Acquisition and Language Instruction Education Programs.

As in the case of immersion programs aimed at enrichment, research supports the pedagogic effectiveness of bilingual education programs. Students in bilingual programs have typically performed at least as well on English reading tests as students in all-English programs (Corson, 2001; Crawford, 2004). Much of the concern over acquisition of English masks the fear many middle-class whites have of losing their majority status. Although proponents of U.S. English attempt to legitimize the organization's existence as a way of breaking down supposed language barriers and facilitating minority access to the material and other benefits of mainstream America, the irony is that most ethnic minorities do not actually want a self-contained ethnic group where no English would be spoken. Nor, however, do they want to assimilate linguistically or culturally. A majority want to maintain their ethnicity and language while also being American. An unfounded fear of diversity itself and thinly disguised racism lies behind the backlash against bilingual education in the United States, and in Europe, where earlier policies of providing home language instruction to the children of migrant workers have been rescinded or drastically curtailed.

Despite propaganda from U.S. English to the contrary, there were actually 4.5 times as many non-English speakers recorded in the U.S. census when immigration reached its highest level than in the 1990 census. The assimilative forces that absorbed those immigrants and their languages are even more powerful today. Although the number of non-English speakers is increasing, so too is the rate of shift to English. Languages other than English are the ones under threat. Spanish is fast approaching a two-generation pattern of language shift rather than the three-generation model typical of immigrant groups in the past. Without the replenishing effects of continuing immigration, Spanish would scarcely be viable in the United States over the long term (Veltman, 1983, 1988).

Weak Linkages between Language Policy and Planning

Despite evidence of growing rather than decreasing diversity in many education systems, in some countries the trend has been toward not recognition of the need for policy and planning but the imposition of ever more centralized provision and greater intolerance of diversity. There are important differences between 'tolerance rights' and 'promotion rights.' Most democracies provide for freedom of government interference in private language use, but many are reluctant to make legal provision for promotion of languages in the public sector other than the dominant language(s).

In addition, weak linkages between policy and planning render many existing policies ineffective (Romaine, 2002). Many language policy statements are often reactive *ad hoc* declarations lacking a planning element. Eritrea's 1995 decision **not** to recognize an official language is a grand declaration with no linkage between policy and planning. Thus, President Isayas Afewerki (Brenzinger, 1998: 94):

When we come to the question of language as a means of instruction in schools, our principle is that the child should use its mother tongue or a language chosen by its parents in the early years of its education, irrespective of the level of development of the language. Our policy is clear and we cannot enter into bargaining. Everyone is free to learn in the language he or she prefers, and no one is going to be coerced into using this or that 'official' language.

Policies cannot be implemented unless those with the duty to implement them are provided with the necessary resources. Policies cannot be effective unless they are tied to a plan for monitoring of compliance and application of sanctions where they are not implemented.

Language Politics

U Ammon, University Duisburg-Essen,
Duisburg, Germany

© 2006 Elsevier Ltd. All rights reserved.

Language politics (LPt) is actual political activity with respect to language and can be distinguished from *language policy* (LPc), i.e., the conception and planning of such activity; but both are, as a rule, closely intertwined (Spolsky, 2004; Ozolins, 1996). LPt's typical agents are state politicians, but they can be members of any polity (institution or community) – for example, a family, a religious community, a town, a nongovernmental organization, or an international organization. Objectives of LPt can vary greatly depending on interests and motives – e.g., ‘purifying’ one's own national language of foreign loans to shape it into a more adequate symbol of national identity, or spreading the language within the state or beyond in order to more efficiently exert power. LPt has to reckon with existing language rights and may result in new language rights (Paulston, 1997) (see **Linguistic Rights; Linguistic Decolonization**).

Internal LPt regulates language within the polity, while *external* LPt aims beyond it. For the state, the former is part of interior politics, the latter of exterior politics. Internal LPt can be directed at language structure (*language corpus politics*, LCpT) or language status and function (*language status politics*, LSPt). Typical aims of LCpT are graphization (introducing or regulating script and orthography); standardization, including codification (selection and codification of norms of spelling, pronunciation, vocabulary, grammar, and style or texts); ‘purification’ (eliminating foreign loans); and modernization (developing modern terminology). Typical aims of LSPt are spreading the norm of a standard

variety and, in the case of multilingual communities, allocating languages to certain regions (McRae, 1975) or domains and functions – for example, official (Laitin, 1992), educational (medium or subject of teaching on various educational levels; Lo Bianco, 1987), religious (Landau and Kellner-Heinkele, 2001), the media, or the military (Ager, 1996; Schiffman, 1996). Politics of language promotion, language maintenance, or language revival can comprise LCpT, such as constructing or reconstructing vocabulary, as well as LSPt, such as encouraging use in the family or institutionalization in school (Ó Riagáin, 1997) (see **Applying Pragmatics**).

External LPt is mainly LSPt or, more specifically, *language spread politics*. Examples of global consequences occurred during colonialism (Phillipson, 1992) (see **Linguistic Imperialism**). Today virtually all the larger language communities, or their major states, endeavor to allocate their languages in international organizations (e.g., the Arab countries in the UN in 1973, France and Germany in the EU; Ammon, 2003, 2004) or in the school curricula of other countries (Ammon and Kleineldam, 1992, 1994; Ricento, 2001; Haarmann, 2005).

Language Socialization

P B Garrett, Temple University, Philadelphia, PA, USA

Introduction

Language socialization is the process whereby a child or other novice develops communicative competence through interactions with older and/or more experienced persons. Language socialization researchers seek to understand how novices learn to use language in the culturally specific ways that enable them to participate competently in the social life of a particular community. Another, equally important goal of language socialization research is to understand the broader sociocultural contexts within which this developmental process occurs, from local to global levels of analysis.

Origins

The language socialization research paradigm was initially formulated in the early 1980s by Elinor Ochs and Bambi Schieffelin (Ochs and Schieffelin, 1984; Schieffelin and Ochs, 1986a, 1986b). At that time, a significant body of research on language acquisition already existed, as did another on socialization (sometimes referred to as enculturation). But the two had developed quite separately from one another.

Language acquisition research, rooted in developmental psychology and psycholinguistics, tended to treat language acquisition as a rather self-contained individual developmental process, largely ignoring the sociocultural contexts within which it occurs; conclusions drawn from studies conducted in mainstream North American and European settings were assumed to be universally valid. Meanwhile socialization research, rooted in anthropology and sociology, was conducted in a variety of ethnographic settings worldwide, but gave little attention to the central role of language as the primary medium through which socialization occurs. Working in collaboration with researchers from several disciplinary backgrounds (including linguistic anthropology, developmental psychology, sociolinguistics, applied linguistics, and education), Schieffelin and Ochs sought to combine the strengths of both of these established bodies of research and to bridge the gap between them.

Axioms and Aims

As this synthetic approach suggests, a central assumption in language socialization research is that the acquisition of language is inseparable from the acquisition of other kinds of cultural knowledge and practices. This is perhaps nowhere more clearly seen than in interactions between young children and their

caregivers, which were the main focus of the earliest language socialization studies (Schieffelin and Ochs, 1986a, 1986b). As a young child is acquiring language, she or he is simultaneously developing a repertoire of social skills and a culturally specific world view. In learning how to use the language(s) of their community, children also learn how to think, how to comport themselves, even how to feel in particular situations and how to express (or otherwise manage) those feelings. As a developmental process, then, language acquisition is far more than a matter of learning to produce grammatically well-formed utterances. It is also a matter of learning how to use language in socially and pragmatically appropriate, locally intelligible ways, and as a means of engaging with others in culturally meaningful activities. Over the course of time, this makes it possible for the child to engage with others in an increasingly broad range of social contexts, and to assume increasingly complex roles and identities. (To varying degrees, these assumptions are shared by researchers in allied fields such as developmental psychology and developmental pragmatics; see Bloom [1998] and Bugental and Goodnow [1998] for useful overviews, and see Blum-Kulka and Snow [2002] for a recent collection of case studies.)

Language socialization research is thus concerned with the microgenesis of communicative competence (Schieffelin and Ochs, 1996), which comprises but also goes well beyond linguistic competence in the generativist sense. Communicative competence also comprises the practical knowledge, much of it predisursive (if not preconscious), that one must have in order to use language as a social tool, to engage in talk as a social activity, and to coconstruct meaningful interactive contexts with others. Language socialization research is thus concerned with all of the knowledge, orientations, and practices that make it possible for an individual to function as – and, crucially, to be regarded by others as – a competent member of (or participant in) a particular community, however broadly or narrowly defined.

Examples of Key Insights and Areas of Investigation

Since the initial formulation of the language socialization research paradigm in the early 1980s, language socialization studies have been conducted in a broad range of settings worldwide. These studies have provided the empirical foundations for various kinds of comparative insights, which in turn have given rise to new theoretical developments and productive new areas of thematic focus as the paradigm has continued to develop.

Nonuniversality of Baby Talk

In their pioneering comparison of language socialization practices among members of three groups – white middle-class Americans, Kaluli (of Papua New Guinea), and Samoans – Ochs and Schieffelin (1984) found important culturally based differences in several areas. One such difference concerns baby talk – the simplified, stylized register that caregivers in some groups (e.g., white middle-class Americans) use with infants and young children. Previously, language acquisition researchers had assumed, based on studies conducted in mainstream North American and European contexts, that baby talk is universal (i.e., used by caregivers in all societies), and that this ostensibly accommodative way of speaking facilitates the child's acquisition of language. Ochs and Schieffelin found that not only do Samoans and Kaluli never use baby talk; they rarely address preverbal children at all, and do not treat them as conversational partners. Even so, young Kaluli and Samoan children are immersed in a richly verbal environment from the earliest days of their lives. Ochs and Schieffelin found that they acquire language at more or less the same age, and at the same developmental rate, as children in Western societies.

Differing Cultural Understandings of Human Development

Ochs and Schieffelin also found that the preverbal child's abilities and tendencies are conceptualized quite differently from one group to another, and that the professed goals of language socialization practices differ accordingly. The egalitarian Kaluli regard preverbal children as 'soft' and helpless, based on not just their lack of physical abilities, but also their inability to use language as a social tool, i.e., as a means of getting what they need or want from others (Schieffelin, 1990). For the Kaluli, a primary goal of socialization is to 'harden' children, which is largely a matter of helping them learn to use 'hard' (adult-like, socially effective) language. (From a Kaluli perspective, the use of baby talk would be antithetical to this goal.) Samoans, in contrast, regard preverbal infants as willful, defiant, and antisocial; among their foremost concerns is that children learn their place in hierarchical Samoan society, and that they learn to act and speak accordingly (Ochs, 1988). Age is an important dimension of social stratification in Samoa, so in this regard young children are near the bottom of the hierarchy. They must learn to adapt themselves to social situations, as they cannot expect their elders to accommodate them (such as by using deliberately simplified language). The first words attributed to children in these two

societies reflect these differing cultural conceptions of the nature of the child: Kaluli believe that a child's first meaningful utterances will be the words for *mother* and *breast*, while Samoans expect to hear a defiant (*Eat*) *shit!* (Ochs and Schieffelin, 1984).

Influence of Local Social Norms on Children's Acquisition and Production of Specific Linguistic Forms

Language socialization researchers have demonstrated that specific aspects of culture and social organization such as those just described can influence children's acquisition of language in quite specific ways at the level of linguistic form. A striking example is Platt's (1986) study of Samoan children's acquisition of the deictic verbs *sau* 'to come' and *'aumai* 'to bring/give.' Young children frequently hear both verbs used as imperatives in everyday contexts, and *sau* is the less semantically complex of the two. Based on this information alone, the expectation would be that children would begin using *sau* productively earlier than they would begin using *'aumai*. But as noted above, young Samoan children occupy a low position in an age-stratified social hierarchy. Very rarely is it appropriate for them to tell anyone to come – it is the prerogative of higher-status persons in Samoan society to remain stationary and to have lower-ranking persons come to them. Young children are expected and encouraged to appeal to higher-status persons to give them things (such as food), however. Thus the number of persons toward whom a young child can appropriately use the imperative *give* is far greater than the number of persons whom the child can tell or ask to *come*. Young children's much more frequent use of *'aumai* 'give' can be taken as evidence that they learn the social norms that organize and constrain the use of these two verbs at the same time as they learn the linguistic forms.

Differing Social Functions of Specific Verbal Practices across Cultures and Social Groups

Language socialization researchers have found that the same basic type of practice or activity may serve different functions in different communities, even in the same society. A good example is verbal teasing. Teasing may be used as a means of social control, i.e., to shame a child and thereby discourage him or her from engaging in a particular behavior (perhaps as an alternative to corporal punishment or some other form of coercive physical intervention, which may be dispreferred); to toughen the child by teaching him or her how to deal with others' affronts, and how to be self-assertive in return; or as a form of interactive play that provides a basis for a child and an adult to engage each other verbally without need

or expectation of exchanging substantive information (Schieffelin and Ochs, 1986b). Examples such as this reveal the potential of language socialization research to reveal both universal and culturally specific aspects of socialization practices, and of communicative practices more generally.

Delimiting Universals of Communicative Practice

Ways of dealing with unintelligibility provide another such example and may offer insight into a universal aspect of communicative practice. Schieffelin and Ochs (1996) propose a universal set of possible responses to unintelligibility, first making a distinction between speaker-rooted unintelligibility (in which the speaker perceives his or her own utterance to be unintelligible to an interlocutor) and addressee-rooted unintelligibility (in which the speaker perceives an interlocutor's utterance to be unintelligible). In each case, they assert, four basic responses are available to speakers everywhere. But in different communities, one response may be preferred over the other three; or two or three may be regarded as more or less equally valid options while another is strongly dispreferred. In the case of addressee-rooted unintelligibility, the four universal options are:

1. ignore unintelligibility;
2. display nonunderstanding;
3. verbally guess at what interlocutor might be saying;
4. negatively sanction interlocutor's unintelligibility (e.g., by teasing or shaming).

Schieffelin and Ochs observe that among Kaluli and Samoans, option #3 is least preferred – quite unlike in mainstream American society. Looking beyond these three groups, one might reasonably surmise that in East Asian societies such as Japan and Korea, where the social dynamics of honorification are pervasive and subtle, empathetic and intuitive styles of interaction are strongly preferred, and there is much concern with face (one's own as well as that of one's interlocutor), option #4 would be dispreferred in most situations; whereas #1, #2, and #3 would all be more preferred, but to differing degrees under different social circumstances (e.g., #3 is much more likely to be used in casual conversation with a peer than in a workplace exchange with one's supervisor).

Language Practices at Home and in School

Certain themes addressed in early language socialization research have been carried forward and taken in new directions in subsequent years. Heath's (1983) comparative study of language use in two working-class communities in the USA (one black, one white) and the implications for children's rates of success in school has had enduring influence. Heath's work

continues to inform recent studies that examine various kinds of continuities and disjunctures between children's home environments and the classroom. The dinner table conversations of white middle-class American families (Ochs *et al.*, 1989, 1992), for example, have been shown to foster specific types of problem-solving orientations and to encourage children to display skills that are expected and rewarded in the classroom. In other settings, cultural disjunctures between home and school lead to poor educational outcomes (Watson-Gegeo, 1992). Research on children from immigrant and other nonmainstream communities in the USA suggests that when classroom activities and modes of interaction draw on communicative practices and participant structures that are familiar to these children, their levels of participation and academic achievement improve significantly (Gutiérrez *et al.*, 2001). Heath's influence can also be traced to other recent studies that focus on the role of narrative in language socialization. Baquedano-López (2001), for example, examines how narrative practices serve as a resource for the socialization of a transnational Mexican identity in a Catholic parish in Los Angeles; and Capps and Ochs (1995) consider the central role that narratives of personal experience play in the discursive construction, and quite possibly the social reproduction, of agoraphobia.

The Development of Subjectivities

A central theme of virtually all language socialization studies is the development of locally intelligible subjectivities, or ways of being in the social world (Kulick and Schieffelin, 2004). This is clearly seen, for example, in Clancy's (1999) study of how affective states and verbal expressions of affect are negotiated between Japanese mothers and their young children; in Schieffelin's (1990) examination of how Kaluli mothers cultivate sibling relationships among their children such that elder sisters will 'feel sorry for,' and always be willing to give to, their younger brothers; and in Fader's (2001) study of how Hasidic Jews in New York City use literacy practices in socializing girls' gender and ethnic identities – also an important means by which symbolic boundaries separating the Hasidim from other groups (including other Jewish groups) are maintained. As these examples suggest, virtually all aspects of subjectivity, including affect, morality, and desires, are shaped in culturally specific ways – and in accordance with cultural preferences, by and large – through language socialization. But in an interesting and productive reorientation of this perspective, Kulick and Schieffelin (2004) urge language socialization researchers to consider 'bad subjects' – those individuals in every community

who persistently display culturally dispreferred traits and/or engage in nonnormative, deviant behaviors. As Kulick and Schieffelin point out, "the focus on expected and predictable outcomes is a weakness if there is not also an examination of cases in which socialization doesn't occur, or where it occurs in ways that are not expected or desired" (Kulick and Schieffelin, 2004: 355). Language socialization research must account for reproduction as well as "why socializing messages to behave and feel in particular ways may also produce their own inversion" (Kulick and Schieffelin, 2004: 356).

Languages and Cultures in Contact

As noted previously, recent language socialization studies explore the ways in which locally situated interactions articulate with macro-level social processes, such as cultural revitalization movements and postcolonial nation-building. Many of these studies have been conducted in settings characterized by sustained contact between languages and cultures, such as occurs in postcolonial, creole, diasporic, urban, and border communities (Baquedano-López, 2001; Fader, 2001; Garrett, 2005; Kulick, 1992; Moore, 2004; Paugh, 2005). These studies investigate the ways in which language socialization processes unfold in linguistically and socioculturally heterogeneous settings characterized by bilingualism and multilingualism, code-switching, language shift, and other contact-induced linguistic and sociocultural phenomena. The coexistence of two or more codes within a particular community, whatever the sociohistorical circumstances that have brought them into contact, is rarely a neutral or unproblematic state of affairs. It tends to be a focal point of discursive elaboration and social conflict, with complex linkages to other, equally contested issues that play out on multiple levels, from the household to the state. As they are socialized to use language, children are also socialized into knowledge of these intimately related issues, and of preferred and dispreferred ways of dealing with them, from their earliest years.

Dynamics of Language Shift

In some contact settings, language socialization practices may be an important mechanism of language shift – a point made vividly by Kulick's (1992) study of rapid shift in a small village in Papua New Guinea. Building on Kulick's work – which shows that local cultural and ideological factors may be of greater importance in accounting for language shift than the macrosociological (e.g., political and economic) factors that are more commonly invoked – more recent studies have shown language shift to be a contingent, nonlinear phenomenon in which language

socialization practices play a crucial but often subtle mediating role. Paugh (in press) shows that young children in the Caribbean island of Dominica are encouraged by their parents and other adults to acquire English, which is contributing to language shift away from the local Afro-French creole. But in later years, as children spend increasing amounts of time interacting with peers beyond the supervision (and earshot) of adults, they increasingly use the creole in their play as a way of enacting adult roles and activities. Although ultimately it may not prevent language shift from running its course, at present such pretend play seems to provide older children with opportunities to develop some degree of proficiency in the creole. In his investigation of a quite similar situation in the Caribbean island of St. Lucia, Garrett (2005) examines code-specific genres as the basis for socialization activities in which adults encourage young children to be verbally self-assertive. Cursing, insulting, and other locally valued self-assertive ways of speaking conventionally require use of the historically stigmatized Afro-French creole language that many St. Lucian caregivers (much like their counterparts in Dominica) otherwise discourage children from using. The persistence of socialization routines in which adults playfully urge children to use the creole in self-assertive ways favors the maintenance of such code-specific genres, which in turn may be having a retarding or dampening effect on language shift.

The Persistence of Everyday Practices

These and other recent studies suggest that a language socialization approach can yield a more nuanced account of ongoing changes and shifts in local communicative practice than can larger-scale, quantitatively oriented studies that are less attentive to situated interactions (particularly those occurring at the critical juncture between generations). In a case where language shift is already quite far along, for example, a language socialization approach may reveal that culturally specific ways of using language persist in speakers' use of the 'new' code. In her study of a Navajo community, Field (2001) demonstrates that although today's bilingual caregivers often speak English to children, they continue to socialize traditional Navajo values of autonomy, self-determinacy, and respect through the use of a triadic participant structure in issuing directives. Based on this observation, Field (2001: 249–250) proposes that “certain aspects of language use may be more conservative, or more resistant to change, than code.” She goes on to assert, “[I]t is exactly those aspects of a speech community's interaction that are tacitly taken for granted that are also the most basic, pervasive, and resistant to change. Furthermore, they are maintained through

the most mundane routines and forms of everyday communicative practice – which also happen to be the preferred context for research on language socialization.”

Essential Features of Language Socialization Research

In whatever setting a particular study is conducted, and whatever specific linguistic and sociocultural phenomena are the focus of the investigation, four key features are essential to language socialization research. These four features reflect the paradigm's interdisciplinary origins as well as its commitment to taking a maximally holistic perspective on the relationships among language, culture, and society.

1. **Longitudinal study design.** Language socialization researchers closely track developmental changes in individual subjects by periodically recording their participation in naturally occurring socialization interactions and activities over a developmentally significant span of time. In order for such tracking to be feasible, a language socialization study usually focuses on a relatively small number of children or novices – typically three to six, or a single small cohort (if the study is conducted in a school or other institutional setting). Qualitative depth of analysis is emphasized over quantitative breadth. Data in the form of naturalistic audio and/or audio-video recordings of the focal children or novices interacting with caregivers and other community members are collected at regular intervals (e.g., monthly), usually over the course of a year or more of sustained fieldwork. Some researchers revisit their field sites periodically over several years or even decades (e.g., Schieffelin, 1996) in order to keep up with individual and community development over longer spans of time.
2. **Field-based collection and analysis of a substantial corpus of naturalistic audio or audio-video data.** Regular, periodic data collection as described above gives rise to a large corpus of recordings; a year-long study typically yields 75–100 hours. A corpus of this size strikes a balance between ethnographic and longitudinal adequacy and practical manageability. But collection of the recordings is only a first step; in order for them to serve as a meaningful data set, the researcher must transcribe and annotate them while in the field. This is accomplished with the aid of local consultants, usually members of the community in which the research is being conducted (such as older relatives of the focal children). For language socialization researchers, this one-on-one collaboration with local consultants is indispensable. In addition to

assisting with the most basic aspects of transcription (such as clarifying specific words and phrases captured in the recordings), consultants can bring to the researcher's attention layers of meaning that would otherwise escape his or her notice or understanding. Collaborative transcription also provides ongoing opportunities for the researcher to benefit from consultants' native-speaker intuitions about the use of particular linguistic forms and variants, and their perspectives on many other aspects of local social life.

3. **A holistic, theoretically informed ethnographic perspective.** This is achieved in part through sustained fieldwork and a commitment to ethnographic methods (including participant observation), and in part through familiarity with current theoretical issues and debates concerning such methods. Both depth and breadth of ethnographic observation are important in language socialization research. In addition to tracking individuals over the course of time (as described above), the researcher must observe and record in a broad variety of contexts in order to understand how different social settings may influence those individuals' language usage and modes of participation. Doing so allows the researcher to observe and record a broad range of persons as well; in effect, tracking a particular focal subject across contexts provides access to an entire social network, and often to a broad cross-section of the community that includes fictive kin, peers, neighbors, etc. Although most recorded data are collected during everyday activities, the researcher must be attentive as well to exceptional events (i.e., those that occur rarely or unpredictably) and to periodic activities such as those associated with agricultural, political, and ritual cycles. The systematic collection of recorded data that is central to any language socialization study may be supplemented by surveys, interviews, elicitation sessions, or other methods, depending upon the kinds of data that are needed in order to address the study's central research questions. Whatever complementary methods are chosen, the researcher should have a thorough understanding of the theoretical issues in which they are based.

4. **Attention to both micro and macro levels of analysis, and to linkages between them.** This can be considered part of the ethnographic perspective outlined above, but is important enough to merit consideration in its own right. Language socialization research is not just a matter of producing detailed ethnographic accounts of individual developmental processes and the local contexts in which they occur. An overarching goal is to

understand how such individual developmental processes relate to larger sociocultural and historical processes. As they analyze their recordings and other microethnographic data, language socialization researchers are constantly on the lookout for patterns and principles that may also be discernible at macro levels of analysis. Likewise, when they make macroethnographic observations, they consider various ways in which the patterns or principles identified may be writ small in their recorded data. Ultimately, the language socialization paradigm is comparative in perspective, recognizing that while some aspects of language socialization are universal, others vary considerably from one sociocultural setting (or historical period) to another. Attention to micro-macro connections is an important means by which researchers are able to distinguish between the universal and the culturally specific, and to consider the relationships between them.

In recent years, some researchers who have claimed to be doing language socialization research have largely if not completely ignored one or more of these four essential areas. (See Kulick and Schieffelin [2004] and Watson-Gegeo and Nielsen [2003] for recent comments on language socialization research design and methodology.) A short-term study that offers no longitudinal observations, a study based solely on questionnaires and interviews, or one that makes use of naturalistic recordings but is not ethnographic in any meaningful sense simply does not constitute language socialization research. (Such a study may yield interesting data and may contribute meaningfully to other research paradigms, of course.)

That said, the language socialization paradigm is sufficiently flexible to comprise a broad range of studies that place varying degrees of emphasis on the four features outlined above. Since the paradigm's initial formulation, certain trends have emerged in language socialization research that reflect broader trends in the social sciences. Most early language socialization studies were conducted in small-scale non-Western communities and focused primarily on microethnographic levels of analysis. These studies yielded classic ethnographic descriptions of these communities as well as fine-grained, strongly longitudinal accounts of how individual developmental processes unfold within them. More recent studies, many of them conducted in Western societies and in various kinds of socioculturally and sociolinguistically heterogeneous settings, have tended to emphasize the ways in which individuals and local communities are implicated in macro-level processes such as those associated with globalization phenomena, and the

ways in which everyday practices of individuals shape and are shaped by those processes (Garrett and Baquedano-López, 2002). Similarly, language socialization studies conducted by researchers of different disciplinary backgrounds show certain broad differences in orientation, such as whether they place greater emphasis on ethnographic topics and issues of social theory, or on grammatical development and the functions and distribution of specific linguistic forms and structures (Ochs and Schieffelin, 1995).

Language Socialization across the Lifespan

Language socialization is always a reciprocal, dialectical process in which the learner, regardless of age or level of experience, is much more than a passive recipient of input. The child or novice plays an active role in coconstructing every interaction in which she or he participates, however limited that participation might be; even a preverbal infant must be regarded as an emergent participant (de León, 1998), who, while being socialized himself or herself, is in various ways socializing others into such roles as mother, father, and elder sibling. Novices can often be observed to resist socialization, or to steer socializing interactions in new, sometimes unexpected directions. Older children may even assume the role of expert *vis-à-vis* their elders, as when a school-age child introduces his or her parents to a new technology (e.g., computers), or when adult immigrants with limited proficiency in the language of the host society rely on their bilingual children to assist them in dealing with persons and institutions outside the household.

Although the majority of studies conducted thus far have focused on young children, others, particularly in recent years, have focused on language socialization later in the life cycle: in middle childhood, adolescence, and adulthood. As this suggests, language socialization researchers consider socialization to be a lifelong process. Even those who study young children avoid treating child development as unilinear progression toward a static, monolithic adult status. Likewise, in studies of older children and adolescents, it is not assumed that they are gradually taking on pre-existing adult roles and identities; on the contrary, they can often be observed, particularly within their peer groups, to contest and renegotiate the tropes and discourses of identity (including gender and racial/ethnic stereotypes) that circulate among adults in their communities and in society at large.

Entry into adult status, however locally defined, is by no means the end of socialization. Adults continue to be socialized into new roles, statuses, identities, and practices, many of which involve new ways

of using language. Adults may find it necessary or desirable to master new registers or styles associated with changes in their vocational or professional lives, or with new avocations or other activities that broaden their social horizons and involve participation in new communities of practice. Similarly, emigration, religious conversion, and other significant life changes may make it necessary or desirable for adults to master new codes and/or new discursive genres, which may involve either spoken or written forms of language (Schieffelin, 1996).

Reproduction and Continuity

For language socialization researchers, close analyses of individuals' participation in naturally occurring interactions are not ends in themselves, but provide empirical points of entry into larger issues of socio-cultural reproduction and transformation. Among the most significant contributions of language socialization research is the insight that it yields into the everyday life of a community – the mundane activities and interactions in which ordinary individuals participate on a daily basis, constituting the warp and weft of social life. As linguistic anthropologists have long recognized, a community's norms, values, ideologies, patterns of social organization, and cultural preferences of various kinds are inscribed in – and to a great extent, constituted by – everyday communicative practices and social interactions. For language socialization researchers, this means that it is possible to investigate the ways in which everyday exchanges such as those between a young child and his or her primary caregiver relate to other domains of social structure and cultural meaning such as cosmological belief systems, kinship, and patterns of exchange and reciprocity.

The cultural knowledge that guides an individual's participation in mundane social interactions tends to be difficult for the anthropologist or other investigator to tap into because it is implicit, common-sense knowledge that is seldom reflected upon or articulated. But even adults or experts for whom it is second nature realize that it does not just come naturally to the child or novice. Virtually all socialization activities (even those that do not involve explicit teaching) are routinized to some degree, so as to provide the child or novice with opportunities to engage in more or less predictable, schematically structured interactions with caregivers, teachers, or other more experienced persons. Socialization activities are thus contexts in which the background knowledge that adults or experts draw upon during the course of everyday activities tends to be discursively formulated and explicitly articulated for the benefit of children or novices. To be

sure, the routinized, explicit qualities of socialization activities also make them a prime analytic focus for the investigator seeking to understand the underlying cultural principles that organize day-to-day social life in the community as a whole.

Transformation and Change

Language socialization research is not merely a matter of accounting for linguistic and cultural reproduction and continuity, however. Language socialization researchers recognize that everyday communicative practices are finely guided by preferences, orientations, and dispositions that are social in origin and culturally specific in nature. But at the same time, they are creatively and strategically deployed by individuals whose particular configurations of interests, intentions, and goals are uniquely their own. Language socialization research therefore highlights the open-ended, negotiated, sometimes contested nature of everyday life, and recognizes that the most ordinary activities may be sites of innovation and far-reaching change.

Languages themselves change over time, and language is a crucial medium through which virtually any aspect of culture may be contested, resisted, renegotiated, and ultimately transformed. Recognizing this, language socialization researchers regard both language and culture as fundamentally emergent, dynamic, open-ended domains that partake of all of the ebbs and flows of social life. A corollary of this is that any given language or culture greatly exceeds the capacities (cognitive, practical, and otherwise) of any individual speaker or social actor; every individual's access, therefore, is necessarily partial (Schieffelin, 1990). This partiality is contingent on specific configurations of social variables (gender, birth order, class, ethnicity, etc.) that in turn shape, and are shaped by, the individual's lived experiences. The variation among individuals that inevitably results – even among children in the same household, or students in the same classroom cohort – is a primordial source of social dynamics, which over the course of time give rise to innovation and change in language and culture alike.

Toward a Relational, Nonlinear Perspective on Human Development

Language socialization researchers therefore avoid conceptualizing human development as a matter of individuals acquiring pre-existent bodies of cultural knowledge, linguistic forms, etc., that are static and bounded. Rather, language and culture, and individuals' acquisition thereof, are conceptualized

in relational terms, emphasizing their symbolically mediated, coconstructed, dynamically emergent qualities (Kramsch, 2002).

This is not to say that the heuristic value of established notions of system and structure are spurned in favor of a radical antiformalism. In practical terms, the processes with which language socialization research is centrally concerned can hardly be described and analyzed without reference to some such notions (e.g., grammar, code, speech community), nor without due regard for the demonstrable formal and structural properties that make them coherent units of analysis. The challenge is to avoid unduly reifying such systems and structures: to avoid treating them as self-contained, autonomous entities that somehow exist apart from the historically particular social worlds and lived experiences out of which they emerge, and by virtue of which they can be discerned, labeled, and posited as units of analysis in the first place. The grammar of a given language, for example, is better regarded as a **precipitate of** or **distillation** from the ongoing flow and flux of communicative practice (at a specific historical moment in the social lives of actual speakers) than as an abstract, timeless **basis for** or **prerequisite of** communicative practice (by hypothetical speakers within an idealized, homogeneous community).

Similar concerns inform language socialization researchers' nonteleological perspectives on the outcomes of socialization (Kramsch, 2002). Individual development is recognized to be variable, contingent, nonlinear, and ultimately open-ended. Differing degrees and types of developmental progress and multiple kinds of successful outcomes are recognized – even when the arena of investigation is a classroom or other institutional context in which the participants themselves differentiate success and failure in much starker terms.

The relational tensions that language socialization researchers seek to explore are well captured by Bourdieu's notion of 'habitus' (Bourdieu, 1977; Bourdieu and Wacquant, 1992). Habitus can be defined as an integrated set of durable, embodied dispositions which predispose the individual to act and react in ways that are more or less specifiable, more or less predictable, but ultimately open-ended and underdetermined. Habitus is the emergent outcome of numerous densely intersecting factors – virtually all of them mediated and substantially influenced by culture – ranging from gender and class status to the particulars of individual life experience. An individual's habitus predisposes him or her to perceive, think, and act in semi-routinized ways, and to regard certain conditions in the world around him or her as normal. But habitus does not rigidly determine that

individual's behavior; it is open-ended, allowing for creativity, improvisation, and innovation.

A defining characteristic of habitus is that it is inculcated, i.e., socialized; the dispositions to which Bourdieu refers are said to be acquired largely through socialization, particularly during the early years of the lifespan. Bourdieu's work says very little about how socialization actually comes about, however. Language socialization research strives to fill this gap in our knowledge of human development by means of empirically grounded studies, and in so doing, to contribute to understandings of the multiplex relationships among language, society, and culture.

Language Teaching Traditions: Second Language

D Musumeci, University of Illinois at Urbana-Champaign, Champaign, IL, USA

Introduction

Learning a language in addition to one's first, or native, language has its roots in prehistory, when tribes encountered other tribes whose language differed from their own and a need to communicate arose, perhaps to exchange goods, form alliances, or ask directions. With no written records on which to rely, we can only conjecture as to how that learning happened. However, it would not be unreasonable to assume that it occurred in much the same way as uninstructed (sometimes called 'informal' or 'natural') language acquisition happens today, given similar communicative needs. Instructed (or 'formal') second language learning, however, has a long and varied tradition that may or may not have been based on communicative necessity, depending on the particular historical context in which it occurred. Traditions in language teaching reflect a mix of earlier, established techniques combined with innovative influences justified by contemporary ideas in philosophy, religion, and later, psychology, in addition to cultural norms and values. A fascinating aspect of language teaching is that particular themes continued to recur throughout its history, down to the present day.

The following overview of language teaching traditions traces their history from classical Greece and Rome to the 20th century. The perspective is Western European based on the role of Latin and, to a lesser extent, Greek in the curriculum. This is not to suggest that other, non-Western traditions do not contribute to our understanding of historical practice. For example, the oral tradition associated with non-Western

educational approaches can provide important insights into second-language teaching and learning. Unfortunately, research on the teaching of second languages within and from the non-Western perspective – as opposed to the teaching of Western languages in the non-Western context – is an area that remains largely unexplored in academic research. Reagan (1996) provides a general overview of non-Western educational traditions, including the teaching of first, but not second, languages.

Early Greek Education

Greeks during the 6th century B.C. held two conflicting views of education in the schools of Athens and in those of Sparta. Although the Athenian model formed the basis for the Western tradition, it is nonetheless interesting to review the Spartan model to see which aspects were shared between the two.

Schools in Sparta

Sparta was a military state established in the 8th century B.C. The Spartan citizen lived for the welfare of the state, of which he was the property, and individuals had no importance apart from the state. Contact with foreigners was discouraged; in fact, free travel outside the state was prohibited. The aim of education was to develop character, not intellectual capacity, and thus to create obedient, courageous, disciplined citizens who were physically fit and loyal to the state. Girls received no formal education; they learned at home the ideals of the state and of home-making. They also studied gymnastics to enhance physical fitness, essential for healthy reproduction. Boys became wards of the state at age 6 years, when they left their family homes and moved into military barracks in units of 64 peers. They would not live in a

home situation again until marriage at age 30 years. A state official, the *paidónomous*, supervised education, with the aid of assistants who conducted the actual training. At age 18 years, young men became cadets, at which time they began a 2-year period of training in military strategy and tactics, followed by a 10-year obligatory military conscription. On successful completion of service, men were granted full citizenship.

The Spartan curriculum consisted of extreme physical training, sports, and military drill, motivated by competitiveness and harsh discipline. Training in literature was limited to accounts of military heroism. Language teaching, first or second, was not part of the curriculum. In fact, the adjective 'laconic' derives from the geographical name Laconia, of which Sparta was capital, to describe the terseness of speech for which its citizens were famous.

Schools in Athens

In contrast to education in Sparta, the aim of education in wealthy and cultured Athens, victorious in the Persian War (479 B.C.), was to produce a well-balanced individual, intelligent and of strong moral character. Although the state supervised and regulated elementary education, it did not financially support it. Each school was independent and privately operated by a teacher. Education was not compulsory. On the other hand, a 2-year period of military training, *ephebia*, beginning at age 18, was mandatory. Only sons of free citizens were educated; girls received their education at home from their mothers. From ages 7 to 14, boys studied reading, writing, music, and gymnastics, with different teachers for each subject. Reading instruction began with learning the alphabet. Children sang an alphabet song and formed the letters with their bodies while the rest of the class guessed the letters and words.

All teachers were male, and each pupil was accompanied by a *paedagogós*, a male slave who served the mixed functions of nurse, chaperon, and tutor throughout the school day. The elementary school teacher was among the lowest-status occupations in Athens. Itinerant teachers provided instruction beyond the elementary school, offering curricula dependent on their interests and expertise: grammar, composition, rhetoric, literature, music, mathematics, astronomy, or physics. When military training became voluntary, it was replaced by higher education in philosophy, rhetoric, and science, offered through private academies.

Plato and the Academy

A military hero from an aristocratic and wealthy family, at age 20, Plato became a student of Socrates,

studying with him for almost 8 years until he witnessed his teacher's trial and conviction in 399 B.C. Disillusioned with Athenian democracy, Plato left Athens, only to return in 387 B.C. and purchase a recreation grove dedicated to the god Academus, wherein he opened a school, the Academy. Plato charged no tuition, relying on the donations of wealthier students to support the enterprise. Both men and women were welcome to study at the Academy. However, only advanced students – those who had already studied geometry – were accepted. The teaching method was lecture-based, with some elements of Socratic dialogue. The curriculum included higher mathematics, astronomy, music, literature, law, history, and philosophy. Plato's epistemology (theory of the nature of knowledge) viewed knowledge as a recalling of ideas that are innate in the soul. He believed that man does not arrive at truth through the senses or by experience. Instead, he must turn inward, looking inside himself. In this way, he can arrive at innate truths through reason. 'Education,' literally 'to draw out of' derives from the idea and exist within learning is the recollection, or remembering, of what is already known and that exists within.

Plato's philosophy, translated into education theory, held that all children should be educated to the limits of their abilities, and that the state, rather than the family, should provide that education. The aim of education was to produce individuals (rulers, warriors, workers, and civil servants) who were oriented to their role in society and whose characters were disciplined to control their animal appetites; that is, to subordinate their senses to reason. Until ephebia at age 18 years, education was devoted to the study of mathematics, literature, poetry, and music. Plato recommended that elementary-level learning be as close to play as possible and that higher levels of learning develop students' critical thinking skills and their ability to use abstract reasoning.

Aristotle and the Lyceum

Aristotle became the most famous of Plato's students in the Academy. At age 41 years, he became tutor to Alexander, son of King Philip of Macedonia, who would later become known as Alexander the Great. At age 50 years, Aristotle returned to Athens and, following in the footsteps of his famous teacher, purchased property and opened a school. The property, dedicated to Apollo Lyceus, provided the name for the school, the Lyceum. The Lyceum became known for its work in natural sciences and was the site of the first zoo and botanical gardens in the Western world. Aristotle's keen observations of nature – honed over the years by examining samples of animal and vegetable life brought back from Alexander's conquests – became

the world's chief source of scientific knowledge for the next 1000 years. Aristotle's teaching style consisted of a morning walk through the gardens with his regular students, during which they exchanged and discussed ideas; his school became known as 'peripatetic,' or 'walking about.' After eating lunch with his students, Aristotle gave public lectures on politics, literature, and philosophy. The students organized themselves and performed the administrative duties of the Lyceum. All students were expected to engage in historical or scientific research, much of which formed the basis for Aristotle's propositions.

Like Plato, Aristotle believed that man is a rational animal: an animal because he possesses a body with physical needs and appetites, and rational because he has a soul. Unlike his teacher, who held that man is born with preformed ideas, Aristotle proposed that man is born devoid of knowledge, a *tabula rasa* ('blank slate') and that he formulates ideas as a result of contact with material objects. Whereas Plato would have defined learning as 'education,' learning for Aristotle was a matter of instruction ('to put into'): a process of putting knowledge into an empty, but receptive, mind.

The aim of education under Aristotle was to produce a good man; that is, to change a man who is not good by nature to one who controls his animal activities through reason. Both his intellectual and his physical abilities should be developed to their fullest potential. Women were viewed as inferior to men, and their proper functions, as wives and procreators, were fulfilled in the home through training in the domestic arts and gymnastics. Even among men, education was aristocratic; that is, limited to the sons of citizens. The curriculum was not to serve any vocational function, as such activities were the provenance of slaves. Reading, writing, mathematics, natural science, physical education, and humanities (rhetoric, grammar, poetry, politics, and philosophy) formed the curriculum. Because man learns from nature, by habit, and by reason, the teacher's function consisted of organizing the material in a logical manner. Repetitive drill was used to reinforce what was understood by reason, and correct habit formation was essential in the learning process.

The opposing ideas of Plato and Aristotle, in simplified terms of 'education' versus 'instruction,' or of innate knowledge as opposed to knowledge derived from experience, had a profound influence on Western education, including traditions of language teaching. Twenty-first century debates surrounding the extent to which language acquisition is a function of innate human faculties or a result of environmental factors continue to capture the attention of linguists and to influence teaching practice.

Roman Education

In the Roman Republic (508–146 B.C.), education took place at home. Mothers or older relatives tutored young children. Strict obedience was valued. Children were expected to acquire an elementary knowledge of reading and writing. Instruction, whether in literacy or in the trades and professions, was through apprenticeship; that is, through example and imitation. Education was largely vocational, not erudite.

The Roman conquest of Macedonia and Greece (201–146 B.C.) had a powerful influence on Roman society and education. The acquisition of the new territory brought thousands of well-educated Greeks to serve as slaves in Roman households, where they became the teachers of Roman youth. Greek language, culture, and philosophy, including principles of education, spread. The Greek language was so commonly used among educated people that one could address the Roman senate in Greek and be understood. The inclusion of jokes and plays on Greek words in Roman theater provides evidence that even lower classes of Roman society were familiar with the language. By the beginning of the 3rd century B.C., Greek was the language of prestige and culture among educated and upper-social class Romans, existing alongside Latin in a bilingual society.

Considered more practical in orientation than the Greeks, the Romans viewed education as a means to an end: It conferred prestige, but more important, it led to higher status and, thus, to better marriage prospects and more opportunities for advancement.

The system of formal education in Rome in the first century B.C. was divided into four levels. The first, or elementary, level, the *Ludus* (meaning 'game' or 'play'), enrolled children from ages 7 to 12. In it, the *magister* ('teacher') taught reading, writing, and arithmetic. Despite its name, the *Ludus* was infamous for its harsh discipline, and teaching was primarily by rote. Children depended on memory to learn. Elementary schools were open to children of all free families, boys and girls alike. In this sense, Roman education was more public than the Greek. (Girls' public education, however, ended at this level.) Romans debated the advantages of public versus private school for their children, and upper-class families employed private tutors for their children. The second level of formal schooling was the Grammar School, enrolling students ages 12 to 16. 'Grammar,' from the Greek *grámma* ('letter'), was the art or technique of writing, not the compendium of rules that the term implies today. The students who attended Grammar School did not typically come out of the *Ludus*. Rather, they were students who had been privately instructed at home for their elementary education.

Both Latin and Greek grammar schools were available, and students could attend one or the other, or both. It is important, from a language learning perspective, to remember that the grammar schools used Latin or Greek as both the content of the curriculum and the medium of instruction, in what we would consider today an immersion-type setting. Young people who attended them would have already been at least functionally competent in the language, having learned to understand, speak, and probably read it at home from a private tutor. The teacher, or ‘grammarians,’ taught grammar (composition) by means of literature, primarily through lecture. Lecture (literally, ‘reading’) consisted of the teacher’s reading aloud of literary texts and providing comments. The texts provided both the content of the lesson and the form that students were to imitate. Students took notes and memorized lectures. From ages 16–20 years, students attended the School of Rhetoric, where they learned how to use language effectively through the continued study of grammar, argument, and speech (or oratory, literally ‘pleading from the mouth’). The chief purpose of the school of rhetoric was to train students to be successful public speakers. The last and highest level of schooling was the University. Two universities were established in the early years of the Roman Empire: one in Athens and the other in Rhodes, both Greek-language institutions. In addition to higher learning, attending the university would have been a study abroad experience. Students who attended the university could be anywhere from 21 to 45 years old. The principal subject was philosophy, but other subjects included law, mathematics, medicine, architecture, and rhetoric. The well-educated Roman was bilingual in Latin and Greek.

Quintilian

One of the most well-known and influential educators in Rome was Quintilian (35–96 A.D.). After training in rhetoric and pursuing a career in law and politics, he was appointed the first state professorship of rhetoric in Rome. Quintilian authored the *Institutio Oratoria* (‘Education of the Orator’), a 12-volume series that covered wide-ranging topics in education from pre-school to advice for the practicing orator. His advice was that of a distinguished politician and orator regarding the education of boys from upper-class families who were destined to become future leaders. From that perspective, the primary objective of education was to train students to be effective and persuasive public speakers who would then be good public servants. Self-discipline, moral integrity, and social conscience were highly valued attributes. In an age that lacked print media, an esteemed man who could sway public opinion with his oratorical skills

held incomparable value for the state. A command of spoken language in conjunction with a background in its literature, history, poetry, music, and philosophy was the mark of a well-educated citizen.

Many of Quintilian’s educational principles would be recognized in modern guidelines for practice. Among other things, he advocated that curricular content must be appropriate to the child’s ability level (a better predictor for success than age alone); individual differences, both intellectual and physical, among students must be taken into account, with aptitude being an important factor in determining success; a system of rewards to promote learning is more effective than one of punishment; learning cannot be forced, rather, interest, motivation, and persistence are better served through a pleasurable instructional experience; content should be relevant to contemporary situations, and activities should deal with the practical application of that knowledge; and public education is more beneficial than private for the development of social skills.

With regard to language learning in particular, Quintilian suggested that spelling should reflect pronunciation and that games should be used to encourage learning. He advocated the use of wooden blocks in the shape of letters as a way for young children to learn the alphabet and spelling. Above all, he maintained that earlier is better, especially where language is concerned. He recommended that children learn Greek first and Latin second, as the latter would be learned anyway in the context of daily life. Because he believed that learning derives from instruction, he warned that care must be taken to expose children only to excellent and accurate models of language use, both with regard to their caregivers and to the texts they read. Errors, once inscribed on the wax tablet that was the metaphor for the child’s mind (Aristotle’s *tabula rasa*), were considered difficult, if not impossible, to erase.

Latin Grammars

Aelius Donatus (4th century A.D.) and Caesariensis Priscianus (end of the 5th to the early 6th century A.D.) were Roman grammarians who wrote Latin grammars. Donatus’s short grammar, *Ars minor*, was so widely used that any elementary grammar book became known as a ‘donat.’ It presented the parts of speech in a question and answer format (‘What is a noun? A part of speech that signifies by its case a person or thing specifically or generally.’) Examples from literature illustrated forms and correct usage. It also contained lists of commonly made errors (alongside the correct forms) and figures of speech. Donatus referred to students’ errors as

'barbarisms,' and it is likely that many of them were incorrect spellings based on language they had learned only from dictation, in addition to influences from Vulgar Latin (i.e., the language commonly spoken by the people), which was quite different both from the classical, literary language that students learned in school and from non-Latin dialects. Priscian's grammar, *Institutiones grammaticae*, meant to follow the *Ars minor*, was an 18-book treatise on all aspects of Latin grammar, phonology, morphology, and syntax, filled with quotations from Latin authors. For many students, the examples from Priscian's grammar constituted their only exposure to Latin literature.

The curriculum that Rome had adopted from Greece, namely, grammar, rhetoric, dialectics, mathematics, astronomy, music, and philosophy, remained unchanged for centuries throughout Western Europe. It was a system of education founded on the study of language and designed for students who were already functionally proficient in the language – Greek or Latin – before they began to study it formally.

Education in the Medieval Age

When Germanic tribes invaded, fractured, and conquered the Roman Empire, many of them accepted the culture of Rome and Greece, including Christianity. As a consequence, the Roman church emerged as a dominant influence in Western Europe. The aim of education changed from the development of the educated citizen to the preparation of a man of God, in anticipation of the afterlife. The focus of education turned away from the practical affairs of the world, from sense experience, from physical education, and from external reality. Truth was viewed as absolute: it was not discovered through experimentation but delivered through faith, and it was found only within the Church. Because pupils were inclined toward evil, as a result of original sin, they had to be disciplined and undergo physical punishment to control their evil inclinations.

The spread of Christianity created a conflict between Christian theology and ancient philosophy in education. Liberal thinkers wanted to maintain what was beautiful from the ancient authors, preserving their culture in a Christian form. Theologians were ambivalent in their attitude toward Latin and Latin authors. On the one hand, the Bible and church services were in Latin, so all clergy needed to learn the language. On the other hand, Latin literature, which had served as the model and the method for language teaching, was pagan and a source of possible moral corruption. Because of this, the classical authors were no longer considered appropriate content, especially for young people. Scripture and the writings of the

early Church fathers replaced them as models for learning Latin.

Three types of schools predominated during the Middle Ages: the catechetical school, the cathedral school, and the monastic school. Catechetical schools provided an elementary level of education consisting of fundamental doctrines of faith. They were designed for catechumens, that is, possible converts to Christianity, and they provided only what was essential in Latin; namely, the memorization of prayers and scripture passages. The monastic schools, in contrast, trained boys to become monks. They retained the Roman curriculum of the seven liberal arts, divided into the trivium – grammar, rhetoric, and dialectics, or logical argumentation – and the quadrivium – arithmetic, music, geometry, and astronomy. The cathedral schools prepared clergy and sought to provide advanced knowledge of scripture, doctrine, and ritual. This instruction was combined with the study of grammar, rhetoric, literature, geometry, history, and philosophy. Boys who did not intend to become either priests or monks but who wanted a general education attended either the cathedral or monastic schools, where they studied the liberal arts as 'externs.'

Monks were members of a religious order, or community, who vowed dedication to lives of chastity, obedience, poverty, farming, and teaching. These monks were workers, not contemplatives. The curriculum of the monastic schools, therefore, stressed practical skills. Latin, too, was learned for utilitarian purposes: reading and singing to participate fully in the ritual activities of the church, writing to copy manuscripts (but not necessarily to understand them), rhetoric to be able to teach and preach effectively, and arithmetic to calculate the dates of Easter.

An early church figure, Jerome (340–420 A.D.), having completed a classical education in Rome and then studied theology, asceticism, Hebrew, and scripture, translated the Bible from Hebrew and Greek into Latin. This was the first Latin bible, known as the Vulgate. It became the official version of scripture for eight centuries. Jerome also founded a monastery and a monastic school in Bethlehem. In a letter dated 403 A.D., he offered advice to a mother on how to raise her infant daughter, much of which can be traced to Quintilian. Jerome stressed the importance of good models and advocated early play with alphabet blocks. He warned against allowing errors to occur and suggested that to ensure accuracy from the very beginning, the mother should guide her daughter's hand as she wrote on a wax tablet or traced letters carved in a board, "so that her efforts confined within these limits may keep to the lines traced out for her and not stray outside of these" (Ulich, 1954: 165). Errors are to be strictly avoided,

as “An unused jar long retains the taste and smell of that with which it is first filled” (166). Jerome also advised that the girl learn both Greek and Latin from the very beginning to avoid a non-native-like accent: “For, if the tender lips are not from the first shaped to this, the tongue is spoiled by a foreign accent and its native speech debased by alien elements” (167). Finally, he suggested that the ideal solution would be to send the girl to a monastery.

Another early Church father, Augustine, in his *Confessions*, provided an account of his language-learning experience. He claimed that language developed out of a need to communicate and that he learned his native language by associating sounds and gestures with objects. He then collected these ‘signs’ and used them to convey his own meanings and desires. Augustine did not know Greek before he went to school and suffered because of it, causing him to hate the language: “The difficulty of learning a strange language did sprinkle as it were with gall all the pleasures of those fabulous narrations. For I understood not a word of it, yet they vehemently pressed me and with most cruel threats and punishments to make me understand it.” He compared that experience to learning his first language, without fear or torment, but simply by listening to people talk to him and attempting to convey his own meanings, concluding that “a free curiosity hath more force in children’s learning of languages, than a frightful enforcement can have” (147). By his own admission, Augustine loved classical Latin literature, but he criticized the amount of time and effort spent on it and particularly disliked grammar: “men care more to observe the rules of grammar than the laws of God” (149).

The Rise of Universities

Moslem influence during the 11th and 12th centuries, with access to Greek texts in translation, stimulated renewed interest in classical learning. Scholars traveled to Spain and southern Italy to peruse the tremendous libraries that the Arabs had built. In addition, the growth of cities provoked a need for professional training in law and medicine. The university had its informal beginnings where teachers and students came together to learn and debate, much as they had done in Plato’s Academy. For their own protection from interference by secular or Church authorities, teachers and students found it necessary to incorporate themselves; hence, the term *universitas studiorum* (‘collective of studies’ or corporation). The University of Bologna was the earliest – established in 1088 – and specialized in law; the University of Salerno specialized in medicine, and the University of Paris specialized in the arts.

At the university, one could attain three levels of degrees: the bachelor of arts, the master’s, and the doctor’s (from the Latin *docere* ‘to teach’). The bachelor of arts degree entitled one to continue for a higher degree. The master’s and doctor’s were earned through the defense of a thesis, demonstrating one’s scholarship. The curriculum for the bachelor’s degree remained the seven liberal arts. Because of a continued lack of books in the Medieval period, the method of instruction was still by lecture, delivered by either a master’s or doctor’s candidate who read something he had written and provided commentary. There was no minimum age for attending the university, and it was not unusual for students to be as young as 12 years old.

As in earlier times, a thorough knowledge of Latin was essential for the successful completion of studies at the bachelor’s level and a prerequisite for more advanced study. By this point in time, however, Latin was no longer any student’s first language. So, to ensure that students would acquire proficiency in Latin, not only for conducting research and writing but also as a means of spoken communication, students were required to use Latin as all times, in and out of class, even in the ‘colleges’ (student residences): “It has been decreed that the speaking of Latin shall be strictly observed in all the colleges and lodgings, not only by the simple students but also by the bachelors, according to the statutes, . . . on penalty of a certain fine to be imposed” (Seybolt, 1921: 72). Students were encouraged to report their peers who didn’t speak Latin outside of class. In fact, some students were appointed language spies, called ‘wolves,’ who recorded the names of students who used the vernacular (their native language) instead of Latin. The students whose names appeared on the lists were summoned and fined.

For conventional and religious purposes during the Medieval Age, Latin remained the language of school even as it became further and further removed from students’ linguistic reality outside the classroom. Students did not possess a functional command of Latin; it was a not used by the vast majority of people in the wider community. Latin was a foreign language. Most students did not use it readily and had to be forced to speak it.

Revival of Classical Studies

With the rediscovery of classical authors, there was a renewed enthusiasm for the *studia humanitatis*; that is, the classical Latin education including literature and history. The proponents of the new learning, the humanists, advocated more than just the correction of manuscripts: They proposed a revival of classical

learning and culture. They sought to institute Latin as the language of wider communication, much the way that English is used today. The school curriculum, then, continued to be devoted to the liberal arts, but with the insistence that texts of the ancient authors form the content of the curriculum. Students would, once again, learn language in conjunction with content, through exposure to excellent models, and not as a system of abstract rules. The most prominent educators of the day – Vittorino da Feltre, Guarino Guarini, Desiderius Erasmus – exhorted that learning should be pleasant, that harsh discipline was unnecessary and counterproductive, and that errors are artifacts of a developing grammatical system and not a sign of linguistic or moral decay. New attention was paid to the surroundings and comfort of the pupils, as evidenced by Vittorino da Feltre's delightful boarding school, the *Casa Giocosa* (the Playful House), where children learned Latin and Greek in an Italian countryside villa while enjoying fresh air, simply prepared food, and lots of physical exercise and outdoor games. Erasmus, the Dutch humanist, not one to mince words, put it boldly when he wrote in his treatise *On the right method of instruction*,

I have no patience with the stupidity of the average teacher of grammar who wastes precious years in hammering rules into children's heads. For it is not by learning rules that we acquire the power of speaking a language, but by daily intercourse with those accustomed to express themselves with exactness and refinement, and by the copious reading of the best authors (Woodward, 1921: 163–164).

Rise of the Vernacular Languages

The humanists' best efforts notwithstanding, they failed in their quest to establish Latin as the universal language. A combination of economic, religious, political, and scientific developments worked against them. As nations formed across the European continent, national languages solidified national identities. Increasing criticism of the abusive power of the Catholic Church stigmatized the use of Latin by association. Although Latin prevailed for a while longer as the language of scholarship and international relationships, it began to lose ground as the vernacular languages grew increasingly powerful. Scientific discoveries began to be published in the vernacular. Galileo published his treatise on planetary movements in Italian, not Latin. The rise of a middle class of merchants and bankers legitimized the vernaculars as media of communication. Parents needed to be convinced of the value of having their children devote

so much time and effort to learning Latin. Perhaps the event that had the most significant effect on the language teaching was one of the greatest inventions of all time: the printing press, which allowed for the mass production of books. For the first time, students had easy and relatively inexpensive access to texts. They no longer needed to commit everything to memory or to laboriously copy reams of commentary and lecture notes. Moreover, it wasn't long before the Latin texts were readily available in translation, either interlinear or in side-by-side columns. Such innovation had the obvious effect of eliminating the need for students to struggle through the Latin text to understand its meaning. They could simply read it in their native language.

In addition to his condemnation of the excesses of the Catholic Church, Martin Luther was also a proponent of widespread literacy education. He advocated free elementary education for all children in Germany so that they would be able to read the Bible and thereby attain salvation. Philip Melancthon functioned as Luther's mouthpiece for educational reform. On the basis of his observations in schools, Melancthon proposed a three-level system. The plan remained basically humanist, with the innovation that children should first be taught (level 1) in the vernacular before proceeding to the Latin grammar school (level 2) and the conventional course of study, followed by the university (level 3). The rules and regulations that Melancthon outlined, however, suggest anything but a golden age for learning: those for the university students prohibit a long list of weapons that students were not to bring to their classes, along with curfews for evenings in the pubs and recommendations to students on how to organize their time effectively.

In England, Sir Thomas Elyot authored the first book on education written and printed in English language, the *Boke named the Governour* (1531). While still advocating the learning of Latin, he argued that English could be used just as well as Latin for scholarly purposes. The Spanish scholar and humanist Juan Luis Vivès (1492–1540) held that language is a living entity, not a static one, and that its use defines its grammar. He proposed that Latin should also be treated as a living language and not simply in imitation of Cicero. Vivès also advocated the use of the vernacular in teaching boys, even though he wrote his treatise in Latin. However, Pietro Bembo (1470–1547), in Italy, not only urged the use of the vernacular but wrote in Italian to praise the Italian language. Bembo was instrumental in establishing as the literary standard the Florentine dialect found in the literary masterpieces by Dante, Petrarch, and Boccaccio.

The Jesuits

The Catholic Church responded to its critics by calling the Council of Trent (1555) to initiate reforms from within. Its program (the Counter Reformation) depended on the education of clergy and laity. Ignatius of Loyola (1491–1556) founded the Society of Jesus, the Jesuits, using a military model: Members would be soldiers who fought for the cause of religion. The Jesuit system of education, although criticized for its elitism, has enjoyed tremendous prestige and esteem since its founding in 1540. The graduate of a Jesuit school was expected to think clearly and logically, express himself eloquently and effectively in speech and in writing, and possess erudition. The *Ratio studiorum* ('Plan of Studies') was the Jesuits' exhaustive description of their educational model. Again, it was a liberal arts curriculum, based on and devoted to the study of Latin. In the lower grammar school, students spent almost 25 hours per week on the study of Latin. Ignatius himself advocated the learning of Latin through literary texts, with Latin as both the medium and the content of instruction. Students were admonished to use Latin at all times. The use of the vernacular was strictly limited, allowed only for the purpose of learning to deliver sermons in it when necessary. Extensive teacher training, rigorous organization, and a carefully prescribed curriculum were hallmarks of the Jesuit system. Despite a lengthy and highly supervised period of training, the least prestigious position was held by the teacher of grammar.

Toward the Modern Era

The esteem with which the Jesuit system was held provided impetus for the Protestants to design a educational system that could compete with it. In opposition to the elitist nature of the Jesuits, the educational reforms proposed by Johannes Comenius included public education for all, regardless of aptitude or intelligence: "a sieve, if you continually pour water through it, grows cleaner and cleaner, although it cannot retain liquid" (Comenius, 1657: 67). A renewed emphasis on observation, experimentation, and reasoning within the scientific paradigm of the day was realized in Comenius's curriculum by a focus on direct experience and learning through the senses. He advocated that pupils study things before words and that teachers organize materials into a natural order, by presenting ideas incrementally, beginning with the known and gradually introducing the unknown, and by recycling material at increasing levels of complexity throughout the curriculum (what he referred to as "the concentric method"). He was

also strongly in favor of repetition, explicit error correction, and accuracy from the very beginning: "the first attempt at imitation should be as accurate as possible, that not the smallest deviation from the model be made. . . . For whatever comes first is, as it were, the foundation of that which follows. If the foundation be firm, a solid edifice can be constructed upon it, but it be weak this is impossible" (Comenius, 1657: 199–200). Although his treatise, *The Great Didactic* (1657) contains many contradictory statements, Comenius's textbooks were his claim to international fame. His major contribution to education is his pioneering use of illustrations as an integral, not merely decorative, element in language textbooks. He, too, advocated elementary instruction in the vernacular school, followed by the Latin school.

Even the most ardent proponents of vernacular education, although advocating education for all, restricted it to the elementary level. Thus they ensured rudimentary vernacular literacy and religious education for the common people. Secondary schools (gymnasias, grammar schools, lycée, academies) were still based on the Latin model and remained the intellectual territory of the elite: boys from well-to-do families who could afford to send them off to school to be trained in the liberal arts.

Vernacular education at the elementary level predominated in the 17th and 18th centuries, whereas the commonest type of secondary school remained the traditional Latin school. The 'naturalistic' movement in education reflected the major philosophical points of Romanticism and naturalism; namely, an emphasis on emotion as opposed to reason, an intense interest in nature and intuition, and the belief that the closer man remains to his natural state, the more authentic he is. Rousseau (1712–1778) authored a treatise on education in novel form, *Émile*, in which he proposed that man is by nature good, but becomes spoiled by the restraints of society and formal education. This position was in direct opposition to the notion that man is born evil and must be saved by God's grace. In line with his philosophical position, Rousseau recommended the elimination of schools altogether.

Émile, however, influenced the ideas of Johann Basedow (1723–1790) in Germany, who established an experimental laboratory school, the *Philanthropium*. His methodology abolished rote memorization, advocating instead the use of games and a natural, immersion-type approach to teach language, even Latin: "They [the youngsters] played the 'Command' game. You see, it is this way: first, they all stand in a row like soldiers, and Herr Wolke [the teacher] is the officer who commands in Latin, and they must do everything he orders. For instance, when he says

claudite oculos, they close their eyes tightly: or, *circumspicite*, they peer around in all directions” (Cole, 1965: 429–430) Basedow’s curriculum emphasized the importance of the vernacular as the language of instruction and led, ultimately, to the elimination of the Latin grammar schools.

The Lesson of Tradition

When the connection between language and content was severed, Latin became a subject in the curriculum, like science or music, rather than its foundation. Moreover, as it no longer functioned as a means of communication – other than to read ancient texts that were readily available in translation – it served no utilitarian purpose and so could be abandoned for the sake of including more practical subjects in the curriculum. The learning of language for a practical purpose presupposes certain social and economic conditions; for example, international politics, evangelization, commerce, travel, and globalization. In the 20th century, ‘living’ modern languages replaced Latin in the curriculum, but interestingly, although the language changed, the teaching methodology did not. The legacy that the teaching of Latin left on the early–20th-century curriculum was one of a system of abstract grammatical rules and translation, despite centuries of reformers’ advice to the contrary.

In an attempt to create successful classroom conditions for language learning, educators returned, perhaps unknowingly, to the last, most confident era of language teaching – the ideal method – in the tradition of Comenius and the Jesuits. Many methods were introduced: The Silent Way, Suggestopedia, Community Language Learning, and the Berlitz Method. Audiolingualism, a language teaching method popular in the United States in the 1960s, promised to produce competent second-language users through the use of pattern practice, with lots of repetition and absolute accuracy from the beginning. The presentation of language was so rigorously prescribed that learners were not allowed to make mistakes or form bad habits. Touted as a ‘scientific’ method-based partially on principles of behaviorism in psychology – it prompted schools to make huge investments in language learning laboratories, where students donned headphones, listening and repeating what they heard on tapes. Needless to say, the method did not produce the results it had promised. Unfortunately, it did produce a generation of learners who were convinced that they were incapable of learning language and a cadre of school administrators who were reluctant to invest in future language learning schemes.

The communicative language teaching movement that became popular in the 1970s emerged in

opposition to the grammar translation practice of teaching Latin, behaviorist approaches, and any rigidly prescribed method. Proponents of the approach argue that learners acquire language through the interpretation, expression, and negotiation of meaning, rather than through the study of grammatical rules, translation, or mimicry. Others propose immersion education or content-based instruction to maintain the connection between language and content, in a way similar to the bilingual system in early Rome. Others seek to recover the humanist tradition and the centrality of literature in language teaching. Those who take a fully vocational approach suggest curricula designed to teach Language for Special Purposes. Rhetoric and argumentation have resurfaced in Language for Academic Purposes courses.

Consonant with a society that values scientific over humanistic endeavors, some applied linguists look for a scientific orientation to language learning. Such approaches place a renewed emphasis on providing learners with models, in the form of ‘input.’ Research continues to investigate the extent to which earlier is better, especially with regard to the acquisition of native-like pronunciation. Other linguists take a more philosophical approach and seek to discover universal truths about language and its acquisition, fueling the debate about whether language derives from innate faculties of the human mind or environmental factors.

Language teachers, having never heard of Quintilian, Jerome, or Vittorino da Feltre, readily embrace the role of affect in language learning to explain why it is important to create an environment that is conducive to learning. They consult language teaching manuals that suggest the use of concrete objects, body movements, and illustrations to convey meaning and to support language development. They include authentic texts in the curriculum to provide models of real language use, although the glossing of text may take the form of hyperlinked text, rather than interlinear translation.

Whether, when, and how to deal with learner’s errors remains a concern, as well as how to focus learners’ attention on form, without losing sight of meaning. How much and what kind of grammar instruction might enhance learning is still under discussion.

Language teaching tradition reveals that true innovations may be rare, but when confronted with the necessity of implementing instruction that leads to successful language learning, the voice of tradition still echoes in contemporary practice.

Languages for Specific Purposes

J Engberg, Aarhus School of Business, Aarhus, Denmark

Defining the Object

The object of study for the branch of applied linguistics that is covered by the heading 'Languages for Specific Purposes' is multi-faceted. The many facets are a consequence of the fact that this discipline looks at (in principle all) aspects of actual communication in specialized discursive domains. To say that discursive domains are specialized means that it is possible to become a specialist in the domain, through education, training, or experience. This definition covers primarily professional areas, but also nonprofessional areas like hobbies. The fact that not a focused part of the human linguistic competence, but the totality of aspects involved in communication in the described settings is the potential object of study, gives studies into the field a very wide range. However, two main poles may be isolated in the landscape of LSP research, around and between which different approaches and projects are located:

- One pole sees LSP as supplementary language skills that are applied when producing texts in specialized

situational settings in order to realize specific purposes. The basic assumption is that language is generally used in the texts according to the ordinary rules known to all language users (Language for General Purposes, LGP), but the ways words are connected and the words are specialized. This approach is generally meant by the English term used to designate the object of study, viz., 'Language for Specific Purposes.' The concept centrally behind this term is closely connected to language teaching for professional purposes, where speakers of, e.g., English as a foreign or second language have to learn (additionally) how to use language in areas where they are going to work. In other words, scholars tending to this pole concentrate upon the specific linguistic differences between language used in different settings.

- The other pole is more closely connected to the concept of specialized meaning. The center of this pole is the concept meant by the German term *Fachsprache*, i.e., domain or subject specific language. This concept lays more weight upon the specialized meanings constituting a domain and upon the relations between these meanings and the linguistic choices conventionally made by the agents of the domain. In other words, the view of the scholars tending to this pole is more global,

they are rather looking at the language of a domain as a general reflex of the domain and the specialized meanings constituting the domain. This latter view is more discourse oriented in its approach to its object.

The two poles describe two original, fairly different approaches to this object: the first mentioned approach, concentrating upon text production in specialized situational settings, is connected to language teaching, especially to teaching a foreign or second language in connection with vocational training, university studies, etc. A major interest in this approach is to create knowledge about the specific needs to be covered in such specialized language classrooms, in order to make this kind of language teaching as efficient as possible. The study of domain specific language use comes in handy as a linguistic basis for such specialized courses. This kind of language teaching is mostly connected to learning English. For one thing, this occurrence is due to the fact that a number of countries with multiple national languages (often former British colonies like India or Malaysia) use or have until recently used English as a common language, for example, in administrative and judicial settings. Here, there is a strong need for specialized teaching. Secondly, the position English has especially in the scientific world as *the* lingua franca of international contacts and publications means that there is a strong everyday need among students and scholars from all over the world to acquire specific and specialized English language skills. Consequently, this approach has been followed mainly by scholars working in the field of teaching English to adults with specialized professional or academic needs. Due to the distribution of English in the world described above, the approach is not limited to Britain or the United States, but is widely spread in all parts of the world, although predominantly connected to the teaching of English.

The second mentioned approach, the one focusing more on the specialized meanings, has a different root. It grew out of a general interest in sociology and dialectology and was an extension of former studies of different population groups' ways of living through studies of their discourse. Thus, the original interest was wider in its scope. This study led to an early interest in global models of communication in specialized settings, combining text internal and text external factors in the descriptions and focusing upon global explanations including and combining discursive features, relevant knowledge, and social backgrounds rather than just finding specialized elements of the discourse. Germany and Austria were the two countries where this kind of study of specialized

discourse was first developed, but also the Scandinavian countries have a tradition for investigating specialized discourse from this perspective.

It is important to say that modern LSP research is normally not placed at any one of the two poles, but rather at some place on the continuum between them. And furthermore there is no 1:1 relation between countries and approaches. Just as an example, recent work by Bazerman (1995) and by Swales (1998) is highly discourse analytic in its approach and thus more broadly interested in global features of the specialized discourse.

Basic Distinctions: Relations between Communicators

In their essence, all approaches to the study of domain related discourse are sociological in their basic assumptions. This tenet is reflected in the fact that degree of specialization of a text and, connected to that, the relation between senders and receivers in a communicative situation concerning their respective levels of expertise is traditionally seen as a crucial factor when setting up models for describing specialized communication. The basic assumption lying behind such models is that the characteristics of the participants in the communication and the purposes pursued by them are main determiners of the way texts are written. Many different stratified classifications of the relevant communicative settings have been proposed. The following tripartite stratification gives a fairly good overall picture of the factors underlying the different proposals:

- Scientific discourse: This kind of specialized discourse is characterized by the fact that both senders and receivers are experts (expert-to-expert-communication). Texts show a high degree of abstraction and a considerable amount of often standardized terminology. These characteristics are seen as consequences of the purpose of communication in such settings, viz., to develop and refine the general knowledge of a domain. Furthermore, the high prestige connected to such discourse and its highly public character means that, apart from aspects of necessary precision, stylistic features play a very important role.
- Practically oriented discourse: Here, too, we find communication where both senders and receivers are experts (expert-to-expert-communication). But in this type of discourse, the experts are not working on developing or refining the general scientific knowledge of a domain. Instead, they are solving practical problems in their daily work and use communicative devices relevant for these purposes. As

an example, the difference between the two levels in the stratification is the difference between chemical scientists writing learned articles for scientific journals and chemical scientists working in the laboratory, running their experiments and collecting the data. In the first setting, the purpose is to textually present and develop new knowledge in the field in a public environment (scientific discourse); in the second setting, the purpose of the communication is to solve practical problems occurring in the daily work (practically oriented discourse). The second setting tends to be more informal and to show only the degree of, e.g., terminological specialization in its oral or written texts that is necessary for coping. Aspects of necessary precision play a major role here, although also in this stratum the sociological aspect of showing by way of the applied language that the communicative party belongs to the relevant peer group should not be neglected.

- Discourse of popular science and domain-oriented didactics: The sender-receiver relations are here always asymmetric (i.e., sender has a higher degree of relevant knowledge than the receiver(s)). Two prototypical cases are communication between experts and consumers (e.g., in manuals) and between experts and novices (e.g., in textbooks). The purpose of this kind of communication is to convey structured knowledge of the domain to receivers who lack this knowledge, but need it for (often) practical purposes. A third prototypical case is the communication of domain-specific knowledge in magazines for popular science. This kind of communication is slightly different from the two cases first mentioned,

as it is characterized by a very important element of entertainment, whereas, e.g., manuals and textbooks are more directed toward actually enhancing the receivers' knowledge in practically relevant areas. Although texts of all three prototypical kinds show lots of similarities due to the fact that sender-receiver relations are always asymmetric, they also show important differences, mainly due to the last-mentioned difference.

Traditional Approaches

In order to describe the very complex object of study, that is text from specialized domains in all their aspects, LSP linguistics has included a wide variety of disciplines and approaches from the general toolbox of linguists, see **Figure 1**.

In the following list, we outline some of the central approaches of LSP linguistics and relate them to the above model.

- Terminology and lexicography: A very central area of LSP linguistics and historically the first area of studies of special domain language to be developed in large scale is terminology. Traditionally, terminology has concentrated upon standardizing the use of words (lexis) and the denomination of concepts, in order to shape languages for specific purposes, so that they are optimal for scientific or professional communication. Recently, terminology has expanded toward other areas like organization, representation and handling of information and knowledge, thus contributing to the development of systems and

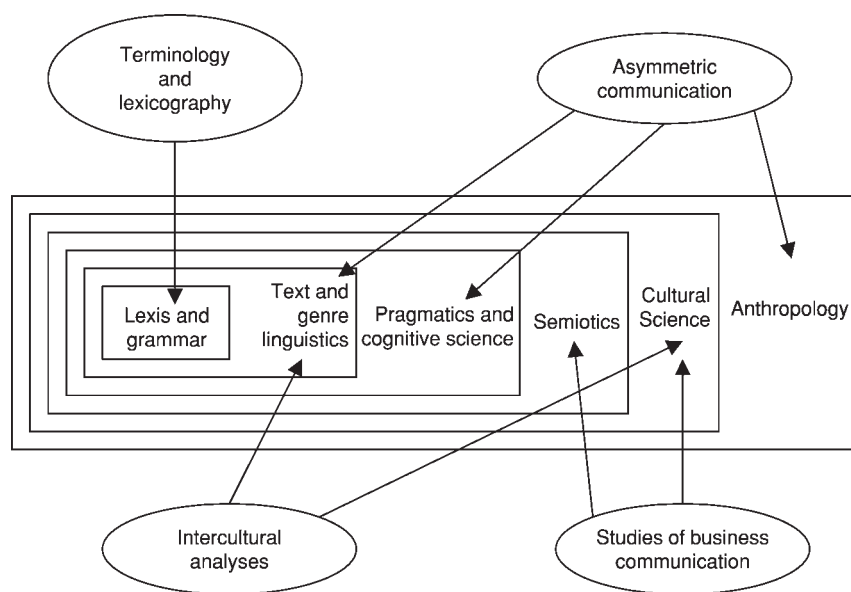

Figure 1 Linguistic disciplines with special importance for LSP linguistics.

databases for storing knowledge. Consequently, the interface between knowledge stored in words and knowledge stored in other semiotic systems is of major importance for modern terminological research. Especially technical domains have been the object of terminological studies. Another area connected to lexis and to the manageable representation of words and meanings from specialized discourse is lexicography. The main purpose of this branch of LSP linguistics is to create a sound basis for the production of specialist dictionaries that are highly functional for dictionary users. Consequently, research in this area concentrates on the user and his/her needs and the functions of dictionaries that may be deduced from such studies. Studies from this perspective have been performed in many domains, among them especially the areas of science, law, and administration, where there is a substantial need for translational tools. Finally, it is relevant to mention that research in these fields have treated in some detail the question of the importance of cultural context for the term systems of a domain. A general distinction is made between culture-dependent and culture-independent domains. A prototypical example of a culture-dependent domain is the domain of law. Term systems in this kind of domain are basically different across national cultures, as each nation has developed their own legal system. Consequently, legal terms from different cultures in principle do not mean the same (at least as long as no standardization has taken place). A prototypical example of a culture-independent domain is the field of electricity. In this domain, the degree of overlap between term systems from different national cultures is very much higher than in the culture-dependent domains.

- Intercultural analyses (genre analysis, register analysis, conversational analysis): The wish to develop LSP linguistics toward a more global description of discourse in specialized settings led directly to a focusing on the text as the central object of study. And in this connection, the concepts of genre and of registers have acquired paramount importance. This emphasis is due to the fact that both concepts as descriptive tools are highly oriented toward describing the influence of communicative purposes (genre) and situational settings (genre, register) on texts. Thus, to a large extent, the development of genre and register linguistics has been driven by the interest in developing descriptive tools for LSP research. Concrete studies have concentrated upon conventional characteristics of domain specific genres like research articles, legal judgments, statutes, company brochures, or scientific journals. Especially in a continental European context such studies have been performed as contrastive text and genre analyses

across different cultures, thus generating results with special relevance for translators of these specialized genres. Domains with special interest have been the areas of law, medicine, and areas of (technical) science. An area where much work was produced especially in the 1990s was the area of scientific communication, and the applied perspective was the intercultural. This stress was, to a large degree, due to the fact that in these years the development toward English as lingua franca in scientific contexts was speeded up decisively. This development made it especially interesting to investigate whether in scientific contexts the national culture or the (international) discipline is the most influential concerning textual and stylistic choices in text production. An intermediary position was defended by scholars, claiming that academic writing is not influenced by national styles as such, but that it is possible to isolate four different styles, connected to different scientific cultures. No decisive evidence has been found for any of the positions, but the discussion showed different influences at different textual levels. And recently the instruments developed for this type of intercultural pragmatic studies of texts are used also in projects investigating the influence of English textual conventions on texts from different domains (like business communication) originally written in other languages. The intercultural perspective is also relevant for oral communication and has especially been investigated using conversational analysis in a number of cases. The question of differences in ways of negotiating, of showing disagreement, or in solving problems in professional settings has attracted special interest. Finally, it is important to state, that the criterion 'culture-dependent vs. culture-independent domain' is hardly relevant in this perspective, as opposed to what we saw when looking at the perspectives of terminology and lexicography: Also genres from culture-independent domains may differ considerably across national cultures.

- Asymmetric communication: As mentioned above, asymmetric discourse (i.e., communicative situations in which sender and receiver have different levels of knowledge concerning the domain of the communication) is an important part of the object of study of LSP linguistics. And this part of the object has been intensely investigated over the last 20–30 years, applying especially research instruments from text and genre linguistics, pragmatics and cognitive science, but also some instruments from anthropology, like conversational analysis. Studies are geographically concentrated around Europe and North America. The reason could be that the problem of asymmetry in knowledge relations and consequently in (abusable) power relations has been a

central issue in the general discussion in these Western societies. Frequent objects of study have been doctor-patient communication, and communication in court and in other administrative settings, but also the area of technical writing (writing efficient technical documents). Research in this area has had a strong element of prescription, of not just registering characteristics of the object of study, but explicitly of contributing to better and more equal communication also in asymmetric settings.

- **Studies of Business Communication:** The way we have described the object of study of LSP linguistics until now, focus has been on communicative settings that are characterized mainly by their topic, by the object of communication. However, a specific branch of LSP linguistics defines its object of study more on the basis of situational elements and on the basis of the actions performed in specific texts, viz., the study of Business Communication. What makes this discourse domain specific is the fact that it is always tightly connected to the professional purposes of companies or organizations, including such areas as marketing and public relations. Typical objects of study are the internal and the external business communication within and between companies and the management of these communicative processes. In this connection, instruments from cultural science are often applied in order to describe differences and similarities between senders and receivers from different national or international cultures. And as multi-modality plays a major role in texts from these areas of communication, also the instruments from semiotics have been included and used for analyses within this sub discipline of LSP linguistics.

Recent Trends for the Development of the Discipline

In these years the recent trend in the discipline is that three areas are gradually coming into focus, thus supplementing or strengthening (some of) the perspectives and approaches already described above: cognition, semiotics, and the area of document design. The latter areas are already represented in the discipline as it looks today (cf. above), but it is likely that they will receive more attention in the future. Multi-modality is becoming a characteristic feature not only of texts from business communication, but also of texts from many other fields of specialized communication, as the importance of different media and the requirements concerning layout and entertainment are growing. So semiotics will become a necessary perspective when investigating such texts, too. And document design (connected,

among other things, to the area of technical writing) has also a good future in a world, in which the amount of information is immense and the time to be allocated for reading limited. The prescriptive tradition of technical writing, intending to judge the efficiency of texts and not just collect data about the text and its coming to life, will gradually gain more importance also in fields where it has not yet been introduced, like in the areas of legal and administrative communication. And finally, there is a growing interest within the field of terminology as well as within other subfields of the discipline to focus not only upon textual or linguistic issues, but to pay more attention to the cognitive activities underlying communication in specialized settings. The expansion requires the inclusion of more instruments from the area of empirical cognitive linguistics, but is just a consequential next step in a development already running. An interesting consequence of paying more attention to this subject is that it may shift focus from superindividual aspects of communication like conventions, group language, etc. (i.e., more sociologically oriented aspects) to individual aspects like personal knowledge resources, mental processes, and learning styles. Thus, where the two prospective trends mentioned first constitute merely a profiling of the discipline within the directions in which it has been developing for the last 20 years, this last mentioned shift of attention may lead to a major paradigm shift in the discipline.

Languages of Wider Communication

J Brutt-Griffler, State University of New York,
Buffalo, NY, USA

© 2006 Elsevier Ltd. All rights reserved.

Languages used to facilitate cross-linguistic communication among speakers of different languages brought together by processes of migration, trade, or travel, stretch back to the beginnings of recorded history. Some had extensive reach – covering much of the world then tied together by existing trade routes, such as the Silk Road, a loose network that linked the Mediterranean and East Asia – such as Soghdian (a language still spoken in present-day Tajikistan), and, at a later date, Persian (Foltz, 2000). But no language down to the past century could claim large numbers of speakers across the globe. For instance, while Latin served as a lingua franca in Europe for centuries, it had effectively no presence throughout Asia and Africa. One of the hallmarks of the most recent stage of *globalization* has been that the development of such a world language has become for the first time a possibility, and that English appears to have already attained that status or to be well on the

way to doing so. Perhaps because the phenomenon is so comparatively new, while languages serving large expanses that formerly made up large segments of the world market, such as Persian or Latin, have been around so long, terms such as *world language* and *international language* – even at times *language of wider communication* – have tended to be employed, if not exactly interchangeably, then without clear demarcation. In their precise meanings, a *world language* must by its nature encompass the entire globe, while a language can be said to be *international* if it serves clusters of nations. For its part, a *language of wider communication* signifies one that provides a mutually intelligible medium for speakers in multilingual societies.

World Language

A *world language* is not simply the most widely spoken language in the world, or the one that is the official language in the greatest number of nations. To merit such classification, a language must have achieved a position of global preeminence in another key respect: its existence must have become

a practical necessity to fill a wide range of functions brought to the fore by processes of globalization. The development of world language, then, does not represent the culmination of a linguistic process at all; it comes into being as the concomitant of larger historical trajectories, powerful forces that condition communication needs around the world. For most of the history of the world, there has been only the most remote contact between peoples in distant parts of the world. While a world market loosely existed from ancient times, the limitations of transportation and communication technology determined supranational regional zones as the largest effective units for which a lingua franca such as Persian, Arabic, or Chinese constituted a practical necessity. The need for a world language is not felt so long as communication is largely limited to bilateral relations between nations or take place in regional settings in which a particular international language such as Arabic or Spanish suits the purpose. World language requires a stage at which every point, or virtually every point, in the world is thrown into relation with every other, when global communications has become virtually instantaneous, and the trip from any place in the world to any other has been reduced to hours rather than weeks or months. It requires a structure of world trade that is truly multilateral – rather than one that transports goods and services within definite imperially defined channels only (as was the case during colonialism in Asia and Africa).

Such international relations throw together persons from many nations from diverse regions of the world into regular contact, and make ease of communication among them an economic imperative, requiring a recognized common linguistic medium, a world language (see **Intercultural Pragmatics and Communication**). Finding its basis primarily in the economic realm, world language also more and more penetrates technological, scientific, intellectual, political, and even the cultural realm, as the need for translation raises a barrier to the rapidity with which information is disseminated in the digital age. In such a case, the continued spread of a world language finds a strong impetus not only in political economy, as global trade represents an increasing share of the total, but through intellectual and cultural motives, too, as people around the globe are induced to learn it to further their wide-ranging objectives.

On the other hand, a world language need not be widely spoken in every nation of the world, nor must most people in the world speak it, any more than earlier regional lingua francas such as Latin in Europe or Persian along the routes of the Silk Road were universally understood in the supranational political geographies they served. Yet, at a minimum, it would

be reasonable to expect such a language to be widely spoken on every continent, to have an ever-growing number of speakers in every nation, and to have emerged as the single most important language of global commerce.

The world language would not necessarily have the most mother tongue speakers, a distinction that currently belongs to Chinese, with its 874 million speakers (Grimes, 1996). On the contrary, one of the salient characteristics of a world language, like that of a supranational lingua franca like Latin or Persian in an earlier epoch, is that the majority of its users would be non-mother tongue speakers, bilinguals for whom it represents a second language. For them, a world language serves global, as opposed to purely local, functions. It is an entry-point into global relations, and one that need not usurp or even threaten the entrenched uses of the other language(s) they speak.

Is English a World Language?

Most estimates place the total number of English speakers globally at between 500 million and 1 billion, the difference consisting mainly in how proficiency in the language is defined. The best indication of the status of English as a world language is provided by the number of people around the world who feel compelled to gain at least some knowledge of the language, irrespective of their level of ultimate attainment. For it is the motivation of hundreds of millions across the globe to learn English that gives the measure of the degree to which it has become the world language, there being no comparable phenomenon associated with any other language. The rise of English is also demonstrated by the increasing frequency with which it is being incorporated into school curricula (see **Language Policy in Multinational Educational Contexts**), not only in “second language contexts” (such as India and South Africa) where it serves as a *language of wider communication* on the national scale (see below), but even in foreign language contexts (including China and Europe), though this distinction is somewhat losing its usefulness for the description of English. The entrenchment of English in the school curriculum in diverse societies throughout the world will tend to produce a greater proportion of English users globally over time.

While the nature of a world language seems to preclude the need for more than one, the possibility cannot be ruled out that another language of equal, or even greater importance, could emerge, either joining or replacing English in its position of preeminence. As Graddol (2004) has argued, rapid shifts in demography together with a restructuring of linguistic

space by modern telecommunications may produce profound effects on language use by the middle of the 21st century, perhaps redefining how we think of languages (local, national, regional), and simultaneously transforming the notion of world language.

Development of World Language

There have been two primary paradigms employed to account for the linguistic effects of globalization that would give rise to a world language: modernization and linguistic imperialism. Modernization describes the spread of industrial production, technology, finance, and trade, the burgeoning of the middle class, and the birth of a consumer culture, among nations that were previously 'underdeveloped'. From this standpoint, the increasing use of a common language throughout the world simply represents the natural concomitant of the march of progress. In marked contrast, linguistic imperialism finds in the spread of certain languages to the exclusion of others the exercise of Western, ultimately imperialist, hegemony, the extension into the cultural and linguistic realm of the political and economic control that the 'Center' has exercised over the colonial and neocolonial 'periphery' for centuries. Both explanations take for granted that globalization, including the spread of English, represents an essentially Western-driven process, one of which the rest of the world catches up to or is incorporated into European/North American society, rather than a multi-polar process driven by no central hegemony. Brutt-Griffler (2002) shows, rather, the development of English into or toward the status of a world language to be considerably more complex, a process that includes numerous forces, economic, political, cultural, and intellectual, underlying globalization, combined with the active agency of its new speakers around the globe choosing to learn the language.

World Language and Language Contact

The development of a *world language* – as one spoken primarily by non-mother tongue speakers – should produce effects on the other languages of the world and on the world language itself. As a language of bilinguals, it is thrown into contact with languages throughout the world, leading to processes of language change. Certainly the spread of English has exerted an effect on other languages via language contact. This process ranges from the incorporation of English words into languages as diverse as German and Japanese, to the emergence of mixed varieties of other languages and English, for example, *chiHarare*, a mixture of Shona and English spoken in Zimbabwe.

At the same time, other languages have in turn exerted an influence on English. For English itself, entering a phase of the history of the language known as the World English phase, in which non-mother tongue speakers have proliferated until, as noted above, they now exceed the number of its mother tongue users, has produced highly noticeable changes. World English – the phase of the history of the language in which it functions as a world language (Brutt-Griffler, 2002) – has spawned *World Englishes*, often called non-native varieties of the language (Kachru, 1986) spoken in nations throughout Africa and Asia (see also *World Englishes*). It is contested whether there is any global standard of World English, and if so, what that standard might be. But it is clear that the growing number of speakers of new varieties of World Englishes increases their potential to exert a greater impact on international usage of the language.

Linguistic, Political, and Social Consequences of World Language

The implications of the development of a world language have been significant, ranging from concerns over its alleged connection to a loss of linguistic diversity, to questions of access to high-level proficiency in a language that often confers power and privilege to its speakers, to the use of such a language to transcend ethnic identity and traditional gender roles, to questions of the meaningfulness of the paradigm of nativeness within a language of primarily non-mother tongue users (see **Identity: Second Language**). Though all of these questions are important, none has received the attention that has been devoted to the fear that the global spread of English represents a causal factor in the endangerment of languages. Graddol (2004) notes, "Many believe English will become the world language to the exclusion of all others." It has been strongly suggested that in Africa, for instance, the spread of English "is leading to the top-down displacement of numerous other tongues" (Nettle and Romaine, 2000: 144), a contention that has been challenged by others (Mufwene, 2001, 2002). Indeed, if such were the case, we would expect to find gains in the number of native speakers of English in Africa proportionate to the loss of those of disappearing languages, something the statistics do not appear to support. Rather, as Brutt-Griffler (2002) has argued, the spread of English as a world language produces not monolingual English speakers but bilinguals (see also **Bilingualism and Second Language Learning**). Graddol (2004) remarks, "English will indeed play a crucial role in shaping the new world linguistic order, but its major impact will be in creating new generations of bilingual and multilingual speakers across the world."

As English is learned in many multilingual contexts at an earlier age and reinforced by exposure gained through various media, new and old (Berns and de Bot, 2004), the distinction between native and non-native speakers of the language may be increasingly blurred, as fluency in it may be used as an 'exit visa' from ethnic identity and traditional gender roles (Mazrui, 2004). The continued growth of English as a world language will prompt ever-greater concerns about access to the language for all members of society, and not simply for those who can afford to buy it, and about the economic and intellectual advantages knowledge of such a world language can confer.

International Language

Though the rapid growth of the world language over the last century has taken attention away from other *international languages*, a large number continue to play a vital role in the modern world, as they have for at least past millennia and will continue to do for the foreseeable future. International languages are most typically associated with the facilitating of international communication – a function that in past centuries Latin, Persian, Greek, Sanskrit, Turkish, and French all played – and the linking of diasporas across wide geographical expanses. In the modern world, however, particularly with the emergence of a world language, their primary role seems to be developing into the maintenance of supranational economic, cultural, and, within certain limitations, ethnic zones (set off by the use of, for example, Arabic, Swahili, Chinese, Spanish, Portuguese, or French). In some cases, such as Arabic or German, these represent a lack of correspondence between ethnolinguistic identity and national boundaries, as Arabs are dispersed over more than twenty nations on two continents and German is given official or special status in eight European nations. In other cases, such as French, its existence as an *international language* reflects a colonial legacy, in which most of the thirty-four nations in which French has a special status are former African or Caribbean colonies of France (see Table 1) – nations in which generally most people do not speak

French as a mother tongue. A variation of this imperial case is illustrated by languages such as Spanish, which though introduced into the Americas as an imperial language, is now the mother tongue of the majority of people in more than twenty nations in the Americas, which now dominate the Spanish-speaking world. And in yet other cases, such as Swahili, an international language may constitute the expression of emerging postcolonial nationalism that plays out in a supranational context – in this case East Africa. Though Swahili is not originally indigenous to the region and has not been the mother tongue of the vast majority of its peoples, it has at least begun to take on that function for increasing numbers. Another group of international languages, of which the largest is Chinese, are more nearly expressions of a diaspora.

The categories listed above need not be mutually exclusive. For instance, Portuguese is the official language in five African nations, though it is not for the most part the mother tongue of the majority of the peoples in those nations, and yet, like Spanish in the Americas, has become the mother tongue of the majority of the largest lusophone nation, Brazil. French itself, like German, is spoken in several European nations – as well as by a diaspora population in Canada. Russian has spread to neighboring countries partly as an imperial language learned as a second language by peoples incorporated into the Russian empire and partly via a large Russian-speaking diaspora in those nations. In other cases, like Kurdish, the language can be called international, as it crosses national borders, but only because the Kurds have been denied nationhood by the three more powerful states in whose territory their would-be homeland lies. This also brings out a significant distinction between *international* and *world*, because international is based on the original construction of the *national*, world is not.

Major International Languages: A Statistical Picture

The major international languages can be distinguished through an examination of some key statistics, such as those in Tables 1 to 4, which show the number of nations in which official status is accorded to particular languages (see Table 1), and which show the number of mother tongue speakers (see Table 2), total speakers (see Table 3), and second language speakers of selected languages (see Table 4). Tables 5 through 7 provide proportions of print publications in different languages in the sciences (see Table 5 and Table 6) and humanities (see Table 7) and Table 8 shows the percentage of web pages on the Internet (see Table 8). Statistics by themselves can be

revealing, but they only tell part of the story. For example, it is clear that English has no rival as an international language, strengthening its claim as the world language. French, sometimes said to be a challenger, or a “big language” (Graddol, 1997), clearly does not stand out as having the same importance on a global scale, as shown by its placement as a distant sixth as a language of publishing in Chemistry, the discipline for which the most accurate statistics are available (82.5% for English, 0.5% for French,

Table 6 Percentage of languages used in natural science publications, 1980 to 1996

see Table 5), or fourth and second. Respectively, in the natural sciences (90.7% to 1.3%, Table 6) and the humanities (82.5% to 5.9%, Table 7) as compiled by Ammon (1998). French also ranks only fifth in number of web pages (68.4% to 3.0%, Table 8). And while French is second to English in the number of nations in which it is an officially recognized language (63 to 34, Table 1), when we examine total numbers of second language users (Table 4), we find that French, with some 50 million estimated users, ranks not only behind English (300 million+), but also Chinese (188 million), Indonesian (140 million), Hindi (120 million), and Russian (110 million). While such numbers, however, give a very approximate measure of significance as a *language of wider communication* (see below), it does not necessarily reveal

much about a language's international significance. For instance, Indonesian and Hindi are mainly confined to the national borders of Indonesia and India, while French second language speakers lie mainly outside of that nation, as the number of nations in which French serves as an official medium (34) demonstrates, as compared to that of Indonesia and Hindi (1 in each case). Taking the statistics as a whole, however, we can conclude that French is an internationally significant language within the former French colonial world, but, as the statistics on scientific publishing demonstrate, it is not a language commonly chosen when the goal is to reach a world audience.

In the same manner, the contention that German represents a major international language as demonstrated by its official status in 8 nations (Ammon, 1994), placing it behind only English, French, Spanish, and Arabic, and ahead of Portuguese, looks quite different upon further analysis. Because all of those nations lie in a concentrated portion of Europe, and given estimates of only some 28 million second language speakers, it would be more accurate to describe German as a regionally important language in central Europe, of the same type, but not on the same scale, as Arabic (official in 22 nations and with more than twice the number of speakers).

The acceptance of a language as official also reflects neocolonialism in politics that may obscure both actual distributions of language users and their increasing importance globally. For example, while European languages are often official in former colonial settings, other languages do not receive similar endorsement. Thus, while German, though spoken by only 1.5% of the population of Belgium, has official status there, Turkish is not recognized as such in Germany, though its speakers make up 2.4% of the population, and though it is recognized as such in Bulgaria. There are some 15 million Turkish speakers outside of Turkey, not far behind the total of 17.5 million German speakers outside the main German-speaking nations of Germany and Austria.

Functions of International Languages

If we were to conceive the functions of an international language to include linking diasporas to mother countries, most of the world's larger languages could be said to be international in an age of increasing transnational migrations. International languages as such rather serve more institutional functions. They generally confer a sense of political affinity among groups of nations, whether, as in the case of Arab nations and Spanish-speaking American nations, as a sort of proto-nationalism, or, as in the case of France and Belgium and their

former colonies, something more along the lines of a sphere of influence with colonial or neocolonial overtones. They may also facilitate the creation of a common market, whether institutionalized or more informal, particularly but by no means exclusively in the area of cultural productions, such as the Spanish-language film and music industry in Latin America. International languages allow global telecommunications giants to beam information in television signals via satellite to large international audiences – as for instance the Arabic station Al-Jazeera. Finally, they facilitate educational ties between nations sharing a common language.

Impact of English as a World Language on the Functions and Usage of International Languages

While international languages retain their importance in linking language groups across national and continental boundaries, they seem to be losing importance where the goal is to communicate with a global audience. There is thus a pronounced trend toward English as the medium for the publication of scientific research (Tables 5, 6, and 7). Table 6 shows that of the articles indexed by *Chemical Abstracts* the percentage in English increased from 62.3% in 1978 to 82.5% in 1998, while the proportion in every other language except Chinese fell. The two languages that followed English in 1978 experienced particularly dramatic declines thereafter, Russian (19.5% to 3.1%) and German (5.0% to 1.6%), while French fell off from 2.4% to just 0.5%. Ammon's (1998) figures (Table 7) demonstrate the same trend the natural sciences as a whole. English shows similar dominance on the Internet (Table 8). In 2000, 68.4% of web pages were in English, with only Japanese (5.9%) and German (5.8%) registering more than 5%, followed by Chinese (3.9%), French (3.0%) and Spanish (2.4%) above the 2% level (Maurais, 2003).

Languages of Wider Communication

A *language of wider communication*, also known as a *lingua franca*, provides a mutually intelligible medium for speakers in multilingual societies, to some extent replicating on the intra-national scale the function of world (or international) language(s) on the global scale – although world and international languages are languages of wider communication in the broadest sense of the term. There are three major categories of languages of wider communication:

- international languages which may not be indigenous to the region, such as English, French, or Portuguese in Africa, or alternatively may be

indigenous, as in the case of Swahili in East Africa and Hausa in West Africa; English as a language of wider communication in Europe (Seidlhofer and Jenkins, 2003) represents something of an intermediate case, because English is indigenous to a portion of the region but not in continental Europe where it plays its specific role;

- languages of indigenous origin that have come to fill the role of national (or regional) languages, though they are not the mother tongues of the majority of the people, for example, Bahasa Indonesia (Indonesia), Tagalog (Philippines), or Hindi (parts of India);
- languages of local and recent origin that have arisen at least in part specifically to fill the function of a language of wider communication; often called *urban vernaculars*, they are mixed languages containing elements of local languages, and sometimes international languages such as English or French; Isicamtho (South Africa), chiHarare (Zimbabwe), and Town Bemba (Zambia) number among them.

When English or French functions in this capacity, it tends to be referred to as a *second language*, to signal that it provides many speakers of a given nation with a medium in which to communicate when confronted with nationals outside the speaker's language group. In such cases, the second language may or may not be given official status, but it is generally adopted for a wide range of societal functions: economic, political, and cultural. In the second case, the languages are always official, and are also designated as national, as they are held to embody the national aspirations of the people, as may also be the case with an international language such as Swahili that is indigenous to the region. In the case of *urban vernaculars*, they are seldom given institutional recognition of any kind, and in many cases have only begun to be distinguished as languages in their own right. In the highly fluid circumstances in which they arise, they may even become transformed into the mother tongues of at least a portion of their speakers and may also be making their way into the classroom (Childs, 1997).

When a language is spoken in only one or a few countries as a second language by many of its speakers, that constitutes evidence that it functions as a language of wider communication. Two such languages are Swahili, which according to some estimates has as few as 5 million mother tongue speakers and 30 million second language users, and Bahasa Indonesia, with some 17 to 30 million native speakers as compared to 140 million non-mother tongue users. Ten major languages of wider communication, with estimates of their number of second language speakers, are given in Table 4.

Functions of Languages of Wider Communication

Languages of wider communication (*lwc*) fill different functions, from the overtly political and institutional characteristic of top-down statist language planning agendas to bottom-up processes that may even go unnoticed by policymakers. When designated as official or national languages, *lwcs* can be used to promote nationalism in multi-ethnic societies, and may be associated with particular political forces or ideological aims – a role that may be as divisive as it is unifying. Hindi in India, for example, is widely associated with Hindu nationalism and viewed with suspicion, if not hostility, by large sections of the population. At the other extreme, the *lwcs* that have arisen in urban African contexts have been the spontaneous products of the mixtures within them of large numbers of speakers of various – and often closely related and mutually intelligible – languages. Closely connected, as Mufwene (2004) has pointed out, to the encroachment of urbanization on “the function of most indigenous languages as markers of ethnic identity,” these languages may be used to deemphasize ethnic identity or to signal urban identity. Despite the latter connotation, or perhaps indeed because of it, such mixed languages, including South Africa's Isicamtho, chiHarare in Zimbabwe, Lingala in Congo, Town Bemba in Zambia, and Wolof in Senegal, appear to be spreading apace to rural areas, too. Because they are largely confined to non-elites, such *lwcs*, though probably the fastest-growing languages in many places, have so far received little, if any, official recognition.

Law and Language: Overview

D Kurzon, University of Haifa, Haifa, Israel

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Interest in legal language is not a modern phenomenon, although extensive research into it began to appear only in the latter part of the 20th century. Earlier comments on the language of law were exclusively critical of the style, vocabulary, and structure of legal texts, especially legislative language. We find the French philosopher Baron de Montesquieu in his *De l'Esprit des Lois* (1748) arguing for a simple legal language, to be understood by all readers in the same way, and furthermore to be understood by people even of mediocre understanding (*"mediocre entendement"*). The 19th century English utilitarian, Jeremy Bentham, also proposed that legislation should be written in a language understood by laypersons. "Clearness in respect of its language" was one of the seven properties, Bentham argued, "a body of law ... must be possessed of."

These comments show that there was a problem felt by leading thinkers concerning the language of the law. Both Montesquieu and Bentham related to legislation, but their criticism may be equally directed

to other legal documents. Furthermore, legal language and legal institutions have been the target of criticism in literature. Charles Dickens' description of the English Chancery Court in his novel *Bleak House* – the time it takes for the judges to decide a case, the language which no one understands, etc., – is well known.

In the early days of modern linguistics, before it had become an established discipline, we do find studies on the law and its language. Several members of the pre-World War II Prague Linguistic Circle addressed problems of legal language. The language of legislators was examined from a functional perspective, with the focus on the educational level of readers of legislative texts, which implies that many people who are affected by the law are not able to read the texts in which the law is written. Another facet of the work of Prague linguists was in the field of vocabulary; observations were made on the careful use of words in legal texts which have inexact meanings in everyday discourse.

Academic lawyers had also dealt with legal language, and published articles, and even textbooks on the drafting of legislation and other documents. These tend to be prescriptive from a lawyer's point of view, and are not outwardly critical of the structural complexities found in legal texts. An exception is the

seminal work of David Mellinkoff (Mellinkoff, 1963), *Language of the Law*. In his book, Mellinkoff, a lawyer, is highly critical of the obtuse language lawyers employ in their documents.

Fields of Research

This section introduces the various fields of research that have grown over the past 30 years or so. Reference will also be made to the various articles that appear in this encyclopedia that relate to current research into those fields of law and language.

Linguistic interest in the language of the law was perhaps initiated by David Crystal and Derek Davy in their book on *Investigating English style* (Crystal and Davy, 1969). In this work, the authors examine a number of registers of English, including the legal register. In the chapter on legal language, they deal with the language of contracts, pointing out the style of legal draftsmen who have developed an intricate and syntactically complex style, in order, on the one hand, to prevent misunderstanding, and on the other, to cover all what the clients want to say and not to depend on extrinsic evidence for the interpretation of the document. They draw attention especially to (1) the conditional structure of the legal sentence; (2) the placing of modifiers immediately adjacent to the phrase or word to be modified; (3) the use of non-finite clauses as postmodifiers; and (4) the lack of explicit connection between the sentences of a document with its accompanying repetition of lexical items and the accompanying sparing use of pronouns. Following Crystal and Davy's book came a spate of work on legal language, especially the language of legal documents. A great deal of this work has been in the fields of grammar, especially syntax, and lexis. Much of the research was produced by Scandinavian scholars (e.g., Gustafsson, 1975), and several of the papers in the special issue of *Text* (1984) were devoted to the language of legal documents deals directly with written legal language, while other articles have a bearing on this register.

In the United States, interest in the law and language came initially more from a sociological and anthropological than a linguistic perspective. One may also cite work on the language of Barotse jurisprudence, Yakan litigation, and Shawnee laws, among others. The type of doubletalk and gobbledygook used by government during the Vietnam War and especially during the Watergate affair also led to many researchers putting the focus on the language of administration and of law. Only in the early 1970s were sociolinguists introduced to this area of research. Brenda Danet's overview of language in the legal process, which appeared in the *Law and*

Society Review in 1980, served as a stimulus to further and broader research in the areas of law and speech. Interest in oral communication in Western legal cultures grew, too, with the development of more efficient recording equipment, which allowed a more accurate record of spoken legal proceedings, thus allowing linguists and conversational analysts to tackle courtroom discourse. A conference was held in 1985 at Georgetown University on spoken legal discourse, e.g., witness questioning, depositions, jury instructions and interpretation; many of the papers presented were published by Levi and Graffam Walker (1990). Another research field in the area of law and spoken language addresses lawyer-layperson communication. This involves dialogue not only in the courtroom but also in the lawyer's office when the lawyer speaks to his/her client.

It can be seen that this distinction between written and spoken legal language is one that pervades research into legal language. Taxonomies of types of legal language have been set up. Within the mode of written legal language, not only are documents such as legislation and contracts examined, but also legal textbooks and law reports. Spoken legal language may be subcategorized into courtroom discourse and out-of-court discourse, and each of these subcategories may be further subdivided; see a description of genres in general.

Against the background of growing interest in spoken legal language, the study of written legal language may seem to have reached its peak in the 1980s; further work on legislative texts, on contracts, and on wills has been carried out not so much from a structural point of view, but more from a discourse and pragmatic perspective. Legal texts, especially written legal documents, have been analyzed as discourse. Moreover, pragmatics has been extended to speech in legal proceedings, for example the adjacency pair of question/answer in witness testimony, and formulaic language in texts such as the witness's oath. This type of spoken legal language has been, and is still being, extensively studied within a sociolinguistic framework, in which pragmatics has found an important niche. The reader is directed to the articles on legal pragmatics and on definitions and rules in legal language.

At the same time as these developments, another field opened up, a field that has emerged from time to time since Montesquieu and Bentham, but has not until recently attracted the attention of scholars in linguistics and sociolinguistics – the problem of the readability and comprehensibility not only of legal texts but, principally, of spoken legal discourse. The Charrows (1979) conducted a psycholinguistic study of jury instructions, pointing out the low level

of understanding of many jurors, who may have to make fateful decisions concerning matters they do not grasp. Many of the attempts to improve the style of legal documents, to make them comprehensible to the layperson, derive from work on language structure. This research and accompanying public agitation eventually led to the support by U.S. President Carter for plain language in legal documents that directly affect the public, e.g., insurance policies. Many legal firms, especially but not only in the English-speaking world, have adopted plain English in their document writing as company policy.

The right of silence of the accused, especially in the Anglo-American legal context, has been studied both in terms of its pragmatics, with attempts made to answer the question what the accused means by his or her silence during police investigation, and also in terms of comprehensibility, establishing it as a field of research associated with plain language. Not only has the Miranda warning (in the United States) been under scrutiny as far as comprehensibility is concerned, but in the wake of changes in the text setting out the accused's right of silence carried out in the United Kingdom, linguists have investigated whether the average suspect with a below-average IQ may understand what is being read out to him or her, and what s/he is reading.

Apart from suspects who may not understand what is being said to them by authoritative figures (e.g., police and lawyers), there are other disadvantaged groups who face a linguistic battle in the course of legal proceedings. Litigants and suspects who do not speak, or who have an inadequate knowledge of, the language used in the courts are in many jurisdictions entitled to an interpreter. The various problems arising from interpretation and the rights of the interpreter and the interpreted are discussed in, while other disadvantaged groups, for example aborigines in Australia, which has attracted much research recently, is dealt with in.

The employment of linguists as expert witnesses in the courtroom has grown over the last two decades or so. The expertise work requested tends to be in the field of voice and writing identification. Much of the research on language in the courtroom is now included in this field of studies. The associated field of intellectual property rights and their violation is an area of current research discussed in.

We also find groups of philosophers, linguists, and academic lawyers who examine law and language from a semiotic point of view. The Lithuanian-French semiotician Algirdas Julien Greimas wrote with linguist Eric Landowski a seminal work on legal discourse (1966), followed by further work from a Greimasian perspective by Bernard Jackson

(1984). Semiotic research into legal language has also appeared from a Peircian standpoint, and from the Italian analytical school of jurisprudence. A discussion of police/citizen encounters from a semiotic point of view is found in.

The development of legal language has been studied, especially within the European area. Despite a distinction that needs to be made between common law (Anglo-American) law countries and countries whose legal systems are what is termed continental, developed from the Justinian code to the Napoleonic code and beyond, the language of the law in both systems has much in common. This may be seen, too, in a comparative approach in non-European systems. Furthermore, studies have been carried out on the influence of the law on 'normal' language itself, as may be seen in.

There remain a number of less prominent areas in which research has been carried out on the law and language. For example, within the model of Roman Jakobson's functions of language, the poetic function of the language of the law has been examined in terms of rhythm, alliteration, parallel structures, and the extensive use of metaphor.

Legal Pragmatics

B Kryk-Kastovsky, Adam Mickiewicz University, Poznań, Poland

© 2006 Elsevier Ltd. All rights reserved.

A discussion of the intersection of two crucial domains of human activity, language and law, requires an interdisciplinary approach, which is the underlying assumption of this article and one of the main tenets of pragmatics, the study of language in use. The language of the law is not only notorious for its lexical and syntactic complexity, which has given rise to criticism (e.g., Mellinkoff, 1963; Danet, 1980, 1985; Lakoff, 1990), but it also has certain pragmatic peculiarities. The present study on legal pragmatics will provide a pragmaticist's account of legal issues rather than a lawyer's view of the linguistic problems he or she faces. Since the direction of fit is from language to law and not from law to language, the assumption is that the aim of legal pragmatics is to construct an interface between the two domains by searching for pragmatic peculiarities in the language of the law. Thus, this article will investigate the instantiations of selected pragmatic concepts in the language of the law. The starting point of my analysis consists of a few observations on the topic made by others before.

1. The turn-taking system used in court is similar to that of other institutional settings (e.g., classrooms or chaired meetings) in that it is more rigid and less flexible than the one operating in everyday face-to-face conversation (Levinson, 1983: 301).
2. The institutionalized character of the court is reflected in formulaic, if slightly archaic and stilted language (Lakoff, 1990: 94).
3. According to Danet (1985: 276), legal discourse is concerned with "the nature, functions and consequences of language use in negotiation of social order." Despite its formulaic character, legal language employs a wide range of registers. It can represent various styles, ranging from frozen through formal and consultative to casual.
4. Verbal interaction in court exemplifies various questioning strategies, which lend themselves to

a pragmatological analysis, since "courtroom discourse is unilateral in that barristers enjoy a one-sided topic control of discourse" (Luchjenbroers, 1997: 477). This control is a sign of power, a socio-pragmatic concept discussed in the section 'Power vs. Solidarity' below.

5. Kurzon (1995) emphasized the role of silence in trial proceedings, and his more recent analysis (Kurzon, 2001) addressed the politeness of the judges. He claims that in formal language politeness may be taken for granted and is therefore automatically present (it may in fact be presupposed).

Pragmatic Concepts in the Language of the Law

The main issue addressed here is the extent to which the language of the law lends itself to a pragmatic analysis, e.g., whether typical pragmatic notions can be found in this type of discourse. My hypothesis is that the language of the law shares most of the pragmatic properties of colloquial language. These are presupposition, deixis, implicature, speech acts, and power vs. solidarity.

Presupposition

The notion comes in different guises, such as: semantic, pragmatic, and lexical presupposition, but the most widely recognized distinction runs along the semantics-pragmatics line. Thus, semantic presupposition is a relation between two propositions, such that the presupposing proposition can be denied, whereas the presupposed one is immune to negation, i.e., it is always true. Among the so-called presupposition triggers are a variety of lexical items and syntactic constructions, e.g., Levinson (1983: 181ff) lists more than 30 such items. Take factive verbs like 'regret,' which presuppose the truth of their complements, e.g., in

- (1) I (don't) regret that it's raining.

Here the truth of the complement sentence (i.e., that it is raining) cannot be denied, regardless of

whether the verb in the main clause is negated or not. In contrast, pragmatic presupposition is a relation between two utterances whose truth/factuality is taken for granted in a given context due to the mutual knowledge of the speaker and the addressee(s). For instance, if I ask a secretary in my department 'Is the professor in?' the question would normally presuppose that there is only one professor in our immediate context, i.e., an instance of existential presupposition related to definite descriptions. However, in this case, both I and the secretary know that only one of the many professors in the department, viz. the boss, is referred to with the definite NP 'the professor,' rather than with 'Prof. Brown.'

As can be expected, questions with presuppositions permeate interrogations. Recall the proverbial:

- (2) When are you going to stop beating your wife?

Commenting on such questions, Shuy (1998: 15) showed that they are particularly useful in the case of suspects whose guilt is uncertain. It turns out that questions with presuppositions intimidate the suspects who might think that the interrogators already know the facts that they do not.

In her analysis of the role of questions in Supreme Court trials, Luchjenbroers (1997: 482), following Danet (1980: 521ff), defined questions in terms of the degree of factuality of the potential answers, ranging from open-ended questions of 'high' fact value, through *wh*-questions, to restrictive 'yes/no' questions of 'low' fact value. Predictably, the counsel have least control over witness replies with the open-ended questions and maximal control with 'yes/no' questions. The latter are also called leading questions, where the interrogators provide the facts of a testimony and the witnesses either confirm or deny them. The counsel have control over the witness, since they do not only know the answer that they expect to hear, but also gear their questions accordingly. Thus, the answer to the counsel's leading question is presupposed as in the following examples of the most frequent forms which leading questions can take: declaratives, accusatory 'yes/no' questions, and alternative questions, cf. (3a), (3b), and (3c), respectively (notice the use of 'some' which, in contradistinction to 'any,' obviously presupposes the truth of the utterance):

- (3a) You had some alcohol?
(3b) Did you have some alcohol?
(3c) Did you or didn't you have some alcohol?

(Luchjenbroers, 1997: 482).

Deixis

Another pragmatic concept of relevance here is deixis, which can be defined as the expression of

spatiotemporal relations in language by means of 'indexicals' (pronouns and adverbs that indicate three transient notions: the participant roles, the place, and the time of the utterance, labeled person, place, time deixis, respectively), as in the classical example:

- (4) I am here now.

This pragmatic spatiotemporal domain is relevant to an analysis of legal language, especially to court trial discourse, because there consecutive instances of deictic anchoring reflect the spatiotemporal relations between the actual event, its spoken testimony by the witness/defendant, its written records, and possibly its later reception by potential readers.

Since one of the purposes of a court examination is to determine the identity of various persons involved in a case, and the exact location and time of the event, all three major deictic categories are realized in what is called "factuality of persons, place and time," (Kryk-Kastovsky, 2002: 254ff). The category of person is grammaticalized in natural language by means of personal pronouns 'I,' 'you,' 'he/she' referring to the speaker, the addressee, and the third party, respectively. Consequently, personal pronouns used in court trial discourse should reflect the interpersonal relationships between different participants of the trial. Stygall (1994: 180) presented an insightful proposal that personal pronouns should be redistributed in two categories, placing the referent either in the trial world or in the abstract world of the legal universe. Thus, 'you' is ambiguous between two uses: it is deictic when it refers to the addressee(s) and nondeictic in its generic use. Singular pronouns like 'I,' 'he,' 'she' are obviously deictic, whereas 'it' can either be deictic (when it points to an entity), or nondeictic, i.e., when used as dummy subject. On the one hand, this observation contradicts the traditional view that while 'I' and 'you' are unambiguous in everyday discourse, the third person ('he'/'she'/'it') stands for the entities outside the discourse situation, and thus is often called 'a nonperson.' On the other hand, Stygall's stand correctly reflects one of the possible approaches to court trial discourse, i.e., that its structure consists of textual layers. In his study of old court trial records, Koch suggested three textual layers in which the dialogue going on in court can be embedded: legal framework of questioning, report of a statement, and a dialogue rendered as a quotation (Koch, 1999: 406ff).

In addition to the major deictic categories, scholars have also distinguished discourse, emotional, and social deixis. These can be labeled 'marginal deictic uses,' since as opposed to person, place, and time deixis, they are not obligatory occurrences

determined by the very nature of language, but are totally dependent on the speaker's choices. Thus, discourse deixis points to a (preceeding or following) portion of the text/discourse, emotional deixis employs demonstratives to mark a personal attitude towards a given entity, and social deixis concerns the use of forms of address as markers of social distance, cf. (5a), (5b), and (5c), respectively (court trial transcripts from Shuy, 1998, emphasis mine):

- (5a) Q: What stuff did you tell him that's true?
A: That I ain't did **that**, that I knew her for a long time.
(5b) A: Then when I got to school, **this** boy told me about what happened.
(5c) I have known **Ms. Lockhart** for about 2 years. Sometime I call her **Ms. Lillie**.
(Shuy, 1998: 164ff).

As we have seen, deixis is not only one of the major properties of spoken language (more than 90% of human utterances contain deictics), but for obvious reasons, it is even more pervasive in the language of the law.

Implicature

The Gricean idea of 'what is meant but not said' is undeniably relevant to the language of the law, where actual meanings have to be inferred from examinations, witness depositions, and other forms of judicial discourse. As Mey (1993: 99) stated, implicature is a regularity that cannot be captured in a simple syntactic or semantic rule, but by some conversational principle. One of the best-known examples of implicature comes from Levinson (1983: 97):

- (6) A: Can you tell me the time?
B: Well, the milkman has come.

where A has to infer the answer (e.g., that the milkman always comes around 6 A.M., hence the time has to be about 6 A.M.).

In the context of a court trial the process of inferencing and the resulting notion of implicature might constitute useful tools both for the interrogators in asking questions and for the interrogated in providing or evading answers. Atkinson and Drew (1979) analyzed court trial discourse in conversational-analytic terms and have shown that, in contradistinction to conversation, which is more loosely organized (the turns are not prelocated), court examination involves question-and-answer sequences. Since the turns in court trial discourse are prelocated in one direction only (i.e., from the interrogators to the interrogated), any pauses in the examination of witnesses or defendants have an inferentially implicative character, i.e., after the witnesses and defendants provide their

answers, the next turn reverts to counsel who self-select. Inferences also work on a more elusive, psychological side of the court trial discourse, since any utterance can be a basis for moral inferences made about the speaker by the hearer(s) (Atkinson and Drew, 1979: 68). Compare these observations to the role of perlocutions in everyday discourse as opposed to the perlocutions that occur in court trials and often carry moral and social obligations (Kryk-Kastovsky, 2002: 236ff).

Inferencing can also be employed to discover what Harris (1994, emphasis original) called ideological propositions in courtroom interaction, such as:

- (7) This court is a **reasonable** court – trying to do **justice** to both sides in some disputes?

As Harris (1994: 161ff) rightly pointed out, the concepts of a court based on reason and exercising justice are ideological assumptions that underlie the judicial system by definition and are therefore often quoted by public figures as the basic principles securing the credibility of the legal system and political democracy in general. Therefore, by challenging the justness of the court, the statement starts an ideological dispute and thus implicates an oppositional view of reality. Finally, as demonstrated by Shuy (2004: 11ff), the counsel can use inferencing analysis (which involves the working out of implicatures) in order to solve ambiguities occurring in depositions or recorded data.

Speech Acts

Speech acts are utterances whereby by saying something the speaker performs certain acts, which are called performatives, as opposed to constatives, i.e., mere statements. The distinction was introduced by Austin (1962) and elaborated on by Searle (1969), who distinguished between five classes of performative utterances: representatives, directives, commissives, expressives, and declarations. In his later work, Searle (1975) emphasized the crucial role that performatives (especially declarations) play in legal language, whereas Danet gives priority to directives since "Within the facultative-regulative functions of law they are the most prominent in legislation that imposes obligations," (Danet, 1980: 458).

Speech acts are among the pragmatic concepts that most frequently occur in legal language, since according to Hencher, "[s]peech act theory and the law are made of much the same stuff. Pragmatic concepts such as authority, verifiability, and obligation are basic to both" (Hencher, 1980: 254). The crucial role of speech acts in the language of the law has also been shown in Jori (1994), Maley (1994), and Stygall (1994). Legal discourse is, by definition,

permeated with performatives used by the speakers to perform legal acts. This evidence has been demonstrated by Danet, who claims that representatives, which commit the speaker to the truth of a proposition, can express a strong or a weak commitment, e.g., actions of testifying or swearing vs. asserting or claiming, respectively. Since according to Austin law is a set of commands, even more important to the legal language are directives, future-oriented speech acts intended to change the current state of affairs by making someone to perform some action, e.g., subpoenas, jury instructions, or appeals. Commissives, as the name suggests, commit the speaker to a future action, which includes any kind of contract, whether a business contract, a marriage, or a will. Expressives are supposed to cover cases of the convicted persons, asked before the sentence is announced whether they have anything (personal) to say. This moment is when they have the last opportunity to apologize, excuse themselves, and deplore their crime. Finally, declarations produce a fit between the words and the world, a change that comes about because of the speaker's utterance, as in the classic

(8) I declare the meeting closed. (Danet, 1980: 458ff)

It must be noted, however, that the position of formulaic expressions in legal language goes far beyond single speech acts, like swearing in a witness, requesting information, or warning the suspect of his/her constitutional rights, as in the case of *Miranda Rights*:

1. The suspect has a right to remain silent and he need not answer any questions;
2. If he does answer questions, his answers can be used as evidence against him.
3. He has a right to consult with a lawyer and if he cannot afford hiring a lawyer, one will be provided for him without cost. (Shuy, 1998: 52)

These speech acts are also part of a larger speech event. Such an event can be analyzed not only in linguistic terms, but also in terms of nonverbal context (e.g., spatial positioning and alignment in the courtroom) that can provide information concerning the social organization of discourse (Philips, 1986). Moreover, the physical characteristics of the courtroom emanate the atmosphere of power exercised by the interrogators (Lakoff, 1990: 91ff; Maley, 1994: 32ff). And it is the notion of power that this article will now address.

Power vs. Solidarity

Power in the Courtroom The distinction between power vs. solidarity introduced by Brown and

Gilman (1960), was later been taken up by various theories of politeness, especially by Brown and Levinson (1987). The interplay between power and solidarity is apparent in the context of the courtroom where the interrogators exercise their power on the interrogated. The asymmetrical relation was particularly acute in the past, e.g., in early modern England, when judges could use their power by verbally abusing the witnesses and the defendants. For instance, the infamous Judge Jeffreys addressed the interrogated with invectives like 'blockhead' or 'vile wretch' (Kryk-Kastovsky, 2002: 253). The change in the politeness system to the effect that both social inferiors and social superiors receive the polite forms of address has also had repercussions in the judicial jargon, so that nowadays the distance between the interrogators and the interrogated is much more subtle. While the obnoxious behavior of judges is no longer possible nowadays, some more innocuous ways of indicating the distance can be detected. On the extralinguistic side, it is the spatial organization of the courtroom that creates distance between the interrogators and the interrogated both due to the superior position of the judge (Lakoff, 1990: 87ff) and the role of the counsel who "reduce the witness to a function of a puppet" (Luchjenbroers, 1997: 480). On the linguistic side, the distinction between power and solidarity can be exemplified by the use of the appropriate forms of address and by the presence vs. absence of the legal jargon in the speech of the insiders and outsiders of the courtroom, respectively. Moreover, the power contrast can also be detected in the verbal behavior of men and women. As noticed by O'Barr (1982), who follows Lakoff (1975), women's speech is much more tentative and less convincing due to the use of hedges, (super)polite forms, tag questions, speaking in italics, empty adjectives, hypercorrect grammar and pronunciation, lack of a sense of humor, etc. On the basis of these characteristics, O'Barr makes the distinction between powerful vs. powerless speech and shows that although women use powerless speech more often than men, the two categories are not necessarily to be assigned to the two sexes, but rather they reflect the social position of the speaker (the less powerful the speaker's social position, the less powerful his/her language). The transcripts quoted by the author convincingly demonstrate that powerful language is much more effective in courtroom discourse than powerless language. Consider the following quotation from O'Barr (1982: 65ff), where the emphasized words and expressions are clear instances of powerless language (emphasis mine):

(9) Q: State whether or not, Mrs. A, you were acquainted with or knew the late Mrs. X.

A: **Quite well.**

Q: What was the nature of your acquaintance with her?

A: **Well**, we were, **uh**, very close friends. **Uh**, she was even **sort of** like a mother to me.

As stated above, one of the manifestations of power and solidarity are forms of address, and this is what our discussion will now turn to.

Forms of Address Legal language as a conservative register has preserved many of the old address forms. Even in countries like the United States, where addressing others with first names is quite common, the language used in court is characterized by a high level of formality. Thus, the judge can be addressed as ‘Your Honor,’ ‘The court,’ or much less formally as ‘Judge Smith’ (although here some restrictions apply). In addressing the judge directly, the traditional formula ‘May it please the court’ is used. Lawyers are addressed and referred to as ‘Counsel,’ and members of the jury are addressed with the names of their social roles, e.g., ‘Juror Number One’ (depending on the assigned seat). Interestingly, the same formal register holds true for the interrogated, who are referred to as ‘the witness’ and ‘the defendant’ (Lakoff, 1990: 93). Although analogous situations hold in other languages with regard to referring to the participants of a court trial discourse, crosslinguistic variation applies to the ways a suspect/defendant/convict is referred to in the media. While in English, he is invariably referred to as ‘Mr Brown,’ in German the first and second name, without the honorific ‘Herr,’ are employed (‘Harald Braun’), and in Polish merely the second name, again without the honorific, is used (‘Kowalski’). It might be insightful to look into the (historical and sociocultural) reasons why loss of honorifics is the case in the two languages that have much more elaborate address systems than English. After all, German and Polish employ the T/V distinction (grammaticalized as *du/Sie* and *ty/Pan-i*, respectively), so that the use of honorifics is subject to strict sociopragmatic principles.

The Structure of Courtroom Discourse

In the following section, this article will examine to what extent courtroom discourse can be considered an approximation to everyday speech. As shown above, legal language contains all the major (socio)-pragmatic categories present in everyday communication. Therefore, it might be reasonable to assume that the parallel also holds on the discourse-analytic

level; in other words, that the organization of courtroom discourse does not markedly differ from everyday discourse.

Guidelines for Courtroom Discourse Participants

Intuitively, one of the major characteristics of court trial discourse should be its effectiveness in achieving discursual goals. Such effective courtroom tactics can be found in trial practice manuals addressed to what O’Barr (1982) calls “legal tacticians.” Just to quote a few selected speech characteristics recommended by the authors of such manuals:

1. Overly talkative witnesses are not persuasive.
2. Narrative answers are more persuasive than fragmented ones.
3. Exaggeration weakens a witness’s testimony, etc.

As can be expected, lawyers are also given advice as to effective verbal behavior (O’Barr, 1982: 32ff):

1. Make effective use of variations in questions format to get the most favorable responses for your client. Interestingly, O’Barr notes that lawyers are often warned against asking questions to which they do not know the answers (i.e., they should resort to leading questions, cf. the section Presupposition above).
2. Another recommendation pertinent to this analysis is to vary the styles of questioning depending on the different kinds of witnesses (men vs. women, the elderly, children, etc.), a differentiation one might dub sociopragmatic, cf. the remarks on powerful vs. powerless speech in the section Power vs. Solidarity above.
3. Finally, a piece of advice that reminds a (text) linguist of a cohesion device, i.e., repetition is useful for emphasis, but it should be used with care.

With these guidelines in mind, let us now have a look at the main differences between two types of discourse of interest here, court examination and everyday conversation.

Court Examination vs. Conversation

At a first glance, court trial discourse looks analogous to any other discourse. However, Atkinson and Drew (1979) warn the non-initiates against hasty generalizations by showing to what extent court examinations can be compared to everyday interaction. First, if we consider the structural characteristics of conversation outlined by Sacks *et al.* (1974), i.e., turn-taking, turn allocation, transition-relevance places (TRPs), repairs, etc., predictably, everyday conversation is much more loosely organized than court trial discourse, so that in a conversation the

turns are (relatively) spontaneous and the number of participants may vary. Second, while in court the distribution of power relations is obvious, in everyday conversation any power relations between its participants are not demonstrated overtly due to the different social setting of this type of discourse, which would imply that the Politeness Principle is observed. Third, although questions and answers often occur in a conversation, they are not a norm, whereas the verbal exchange in a court examination consists solely of question-and-answer pairs (Atkinson and Drew, 1979: 61ff). Moreover, in court examinations turn order is fixed and so is the type of turn contributed by each speaker. As Stygall rightly pointed out, turns and TRPs are controlled by the interrogators, whereas repairs and self-repairs, instigated by the questioning process, come from the interrogated (1994: 117ff). Indeed, the relation between the representatives of the two social roles is asymmetric in that only the interrogators have the right to ask questions, and the turns of the interrogated necessarily constitute (preferably adequate) answers to these questions. In other words, the turns in court examination, unlike in a conversation, are pre-allocated, or to use the terminology of Sacks *et al.* (1974), only one party (the interrogators) self-selects.

A unique property that differentiates court trial discourse from everyday conversation is what is called 'legal metacomments' (Kryk-Kastovsky, 2002: 248ff). These comprise the interrogators' comments on whatever is going on in court and are an instantiation of the metacommunicative function of language. Legal metacomments easily lend themselves to a pragmatic analysis due to their peculiar characteristics, in a way comparable to discourse deixis in everyday conversation. Thus, legal metacomments either refer (anaphorically) to a portion of previous discourse, or (exophorically) to a situation outside the actual discourse situation, cf. (10) and (11), respectively. In (10), the metalinguistic use of the verb 'say' takes the utterance outside the actual situation-of-utterance and gives it a special discourse function (i.e., that of a leading question), whereas in (11) the question is commented on by the judge as leading the witness, i.e., its discourse function is also changed from a simple 'yes/no' question to a leading question:

(10) So you say you actually ran away on Friday night? (Johnson, 2004: 105)

(11) Q: All right. Now the car the man was driving, was it a brown, a brown 1972 Chevrolet Nova?

OPPOSITION LAWYER: Objection.

JUDGE: Sustained, leading the witness. (O'Barr, 1982: 142)

The Language of the Law – At the Crossroads of Sociopragmatics, Discourse Analysis, and Intercultural Communication

It follows from the discussion above that (legal) pragmatics does not suffice to explain the intricate interface of language and the law. One of the reasons is that the relation between the two disciplines cannot be reduced to a simple combination of a few pragmatic concepts that occur in courtroom discourse; it calls for a multidisciplinary approach. Apart from pragmatics proper, a broader approach is necessary. First, the relations between the participants of court trial discourse call for a sociopragmatic explanation in terms of power and solidarity and the role which these concepts play in polite behavior, in the use of forms of address, etc. Second, an analysis of the structure and organization of courtroom discourse should be conducted within the conversation-analytic and/or discourse-analytic frameworks to provide a comparison between the verbal exchanges in the courtroom and everyday conversation. Finally, on a more global level, a crosslinguistic and intercultural investigation might be in order to juxtapose the intricacies of the use of legal language in various cultural-linguistic communities. Not only would such an investigation reveal the differences between the Anglo-Saxon and European judicial systems, but also the various organizational peculiarities that result from these differences. Since in Great Britain and the United States the trial procedure is adversarial, whereas in most other countries it is inquisitorial, the following consequences ensue. In adversarial systems, the jury (consisting of lay persons) plays a crucial role in the trial proceedings. While the judge presides, the jury is presented the evidence from both the prosecution and the defense, and decides which side sounds more convincing. The inquisitorial trial procedure is much more rigid in that professional judges listen to the evidence presented by a state-appointed attorney and deliver a verdict. This style puts the defendant at a disadvantage, especially if his/her side is not fully represented. The markedly different roles played by professionals and laymen in both legal systems have serious repercussions for the entire organization of the trial procedures and the chances of the defendants (Lakoff, 1990: 86). Finally, it might also be useful to look at the organization of court trial discourse in countries outside Europe and North America and study different legal traditions, e.g., the court trial procedures in China deeply rooted in Chinese culture based on Confucianism, cf. e.g. Gao (2003).

Linguistic Anthropology

S Gal, University of Chicago, Chicago, USA

© 2006 Elsevier Ltd. All rights reserved.

Linguistic anthropology is the study of language in culture and society. The field analyzes linguistic practices as culturally significant **actions** that constitute social life. The situated use of language is exemplary

of the meaning-making process that shapes a social worlds saturated with contrasting values and contested interests, with opposed political positions and identities, with variable access to institutions, resources and power. Linguistic anthropology examines the role of social interaction – and the semiotic processes on which it relies – in making, mediating and authorizing those contrasts and differences. Aspects of context enter

into this process through linguistic form itself, as form signals speaker alignments and cultural presuppositions that are called into play during social interaction. Presuppositions invoked during interaction can draw on any cultural realm: categories of contrasting identities, folk ontologies, notions of truth, space, time, cosmological order, and morality. Such presuppositions are invariably linked to language ideologies, that is, culturally specific conceptions about language and its role in social life.

Recent research on language-in-context has resulted in new definitions of the field's fundamental concepts: 'language' 'metalanguage' 'discourse' 'context' 'event' and 'text.' Metalanguage is crucial because it makes possible the reflexivity that is a necessary feature of verbal interaction. Reflexivity has methodological as well as theoretical implications. Speakers' categories of speech, events and personae are reflexive in that they create frames of interpretation for social interaction and are not necessarily uniform within any group. They are indispensable starting points for empirical investigation of talk. Such categories provide perspectival views on interaction and contrast with the linguists' own perspectives and direct observations. Scholarly discourses and debates about language are of theoretical interest as well. Like the metadiscursive categories about language and interaction of ordinary speakers, expert debates also create frames of interpretation; they participate in cultural systems, and often legitimate relations of power.

In concert with some poststructuralist philosophies, yet in quite different ways, linguistic anthropology analyzes linguistic practices not only as the instruments of social life, but rather as the **ground** on which social and cultural conflicts are fought. A key issue has been the creation of cultural authority through communication. As a result, current research in linguistic anthropology has considerable significance in the study of political and economic formations, scientific and religious enterprises, as well as in the more traditional study of group boundaries and social identities. Contemporary linguistic anthropology provides the semiotic concepts necessary to understand how social institutions – including "language" and linguistic structure – are reproduced, authorized, and continually transformed.

Terms and Turfs

The label 'linguistic anthropology' was coined in the late 19th century by scholars at the American Bureau of Indian Affairs who collected folkloric material among native Americans. Its current use in the United States dates from the early 1960s, when 'linguistic

anthropology' became a cover term for the study of language in social life and conversely for the study of social context in shaping linguistic structure and use. Two commitments have remained central to the field, and link it distinctively to anthropology: First, ethnography is its indispensable methodology, though augmented by elicitation, interview and audiovisual technologies. Second, linguistic form and function are studied within a cross-cultural, comparative framework, with attention to human universals along with historical, regional, and power-laden sociocultural differences.

A set of other hybrid labels emerged at roughly the same time, also proposing to study language in social, cultural and psychological terms. Scholars from a number of disciplines came together under labels such as: sociolinguistics (later split into interactional and variationist), ethnography of communication, linguistic stylistics, linguistic pragmatics, psycholinguistics, ethnomethodology, ethnolinguistics, conversation analysis, discourse analysis, interactional analysis, sociology of language, and anthropology of language, among others. Some of these terms became alternate designations within linguistic anthropology (e.g., ethnography of communication, interactional sociolinguistics), others have come to mark differences of emphasis (e.g., discourse analysis, pragmatics). Still others, like variationist sociolinguistics and conversation analysis, have developed characteristic methodologies, remaining closely aligned with their disciplines of origin – linguistics and sociology respectively.

The intellectual excitement and energy evidenced by the proliferation of terms, conferences, and edited volumes in the 1960s was an ironic response to the establishment of separate departments of linguistics in American universities in the post-WWII period. These departments provided institutional backing for the formalist study of language as an autonomous phenomenon, putting aside concerns with the contexts of language. They thereby indirectly re-invigorated such contextual questions in other institutional venues. Only psycholinguistics was directly spurred by generative grammar, which legitimated cognitive questions in the face of the reigning behaviorism. The new contextual fields were surely also encouraged by more funding for cybernetics and 'communication research,' which became policy sciences during the Cold War.

Within anthropology, the new labels joined the much older term 'anthropological linguistics,' which was closely tied to fieldwork-based typological research on native North America languages as established by Franz Boas in the early 20th century. Those who now adopt the label of anthropological

linguistics are oriented to linguistics departments, to descriptive work in the structuralist tradition or to historical reconstruction of language and verbal art in unwritten languages. Those identifying as linguistic anthropologists orient to anthropology departments and to language and speech as cultural practice. Many individual scholars are active in both kinds of research. Differences of emphasis notwithstanding, linguistic anthropology and anthropological linguistics have been used interchangeably as labels in textbooks and encyclopedias. The Boasian tradition gives linguistic anthropology significant institutional recognition, intellectual influence and prestige within the discipline of anthropology.

In the hybrid fields of the 1960s, practitioners held themselves accountable to different departmental audiences (linguistics, sociology, anthropology), resulting in different emphases and preferred topics. Collections of articles in the last few decades, however, have usually included scholars from several disciplines, all writing on a single theme. The roster of substantive topics has included: the linguistic marking of social relations and identities; conversational interaction and other speech genres; political processes mediated by speech such as decision-making and dispute settlement; language and nation; multilingualism, linguistic variation and multidialectalism; standardization and literacy; national language policy; narrative, performance, verbal art and ritual; the emergence, circulation and desuetude of languages, linguistic varieties, registers and styles; the acquisition of cultural competence through language; the relation of cognition to linguistic categories as coded in grammars and lexicons; the mechanisms of language change. The last half century has also brought new issues such as the globalization of languages and the effect of novel communicative technologies.

Roots and Shoots

Linguistic anthropology is often called an interdisciplinary field. But considered as an intellectual (rather than a departmental or institutional) endeavor it is rather a set of lineages or kinship lines that are read and invoked for inspiration and legitimation. As in all segmentary lineage organization, naming one's ancestors is also a means of forming alliances and oppositions in today's controversies. (What the field would analyze as the relation of narrated and narrative event.) This very brief recitation of family ties is not a history of linguistic anthropology but an overview of a usable past on which current practitioners rely.

The turn of the 20th century is the conventional starting point, especially the work of Franz Boas, Edward Sapir and their students. They collected

textual materials to document peoples whose cultures were rapidly changing under brutal colonial pressure. These scholars were inspired by the previous century's German tradition that considered language as a historical guide to the customs and values of a group. Starting with Boas's studies of verbal art and folklore, poetics has played a continuing role, strengthened by contacts with parallel interests among Prague School linguists. Contact with avatars of European dialectology of the 19th and 20th centuries helped raise concerns about regional distributions of forms, definitions of languages, standardization, dialect boundaries and historical change. A francophone line of structuralist linguistics starting with Saussure, through Benveniste, is perhaps best characterized as the immediate source for the autonomous linguistics that has been linguistic anthropology's intellectual foil. In this respect, at least, American structuralists from Bloomfield to Harris to Chomsky have been the heirs of Saussure. For linguistic anthropology, by contrast, Saussure's project is significant as part of a broader understanding of sign phenomena.

The other sources of sign theory were the Americans C. S. Peirce and to a lesser extent the more behaviorist Charles Morris. The significance of Peirce's semiotics for linguistics was emphasized by Roman Jakobson, himself a central node in a kin network that connected American structuralism to Prague School functionalism and Russian formalism while also helping to bring the work of Bakhtin's decidedly anti-formalist Russian school of poetics and literary studies of the 1920s and 30s to international attention. Literary studies have repeatedly been 'captured' as relatives by linguistic anthropology, or vice versa, as in the mid-century dramatism of Kenneth Burke, the semiotic readings of Roland Barthes, or the writings of Raymond Williams and other neo-marxist critics. There were also the quasi-literary interests of Malinowski in language function and 'context of situation,' not taken up by British social anthropologists but rather by functional linguists and later in the century within anthropology by Gregory Bateson.

Philosophies of language have also been significant interlocutors for linguistic anthropology. Austin's ordinary language philosophy was particularly important as it side-stepped the Fregean concern with truth conditionality. This was followed by Searle and Grice on speech acts and implicatures, and in a different line by Wittgenstein on language games. A later and contrary branch of this lineage is represented by Hilary Putnam and Saul Kripke on the indexicality of reference. Finally, linguistic anthropology rightly claims important kin connections with phenomenologists such as Husserl who inspired sociologists

from Schutz, to Goffman to Garfinkel, though these doubtless also saw themselves as descendants of G. H. Mead, himself very likely a reader of Peirce.

Relying on all these sources, linguistic anthropology was consolidated in the 1960s through two intellectual strategies familiar from the history of science: The first was a bid to constitute an 'object' of analysis that had not before been the focus of research. Most broadly stated, this object was the process of face-to-face interaction. One can rephrase the argument this way: the primary datum for all the ethnographic and language-based disciplines is the contingent stream of eventful talk in everyday life, along with its concomitant non-verbal signaling systems. Each disciplinary enterprise abstracts from this in a principled manner. What is not within its focus becomes an obstacle to research and is bracketed or theoretically discounted. For instance, Saussure was quite explicit that a synchronic linguistics should (for the moment) ignore what he defined as 'external' though admittedly important facts, instead studying structural relationships of contrast and opposition he defined as 'internal' to language. In a parallel way, the sociocultural anthropology of the 1960s treated language as a vehicle for recounting cultural content, thereby excluding from study the situation in which the telling occurred.

This first project has had considerably success. Linguistic anthropology abstracted something new from that accessible stream of verbal activity, finding systematicity where others had found only noise: Goffman's "neglected situation;" "naturally occurring talk" and 'conversation' as defined by Schegloff and Sacks; the "speech event" and its functions, as defined by Jakobson; studies of performance genres by Hymes, Friedrich, Albert, and Ervin-Tripp; Barth's notion of interactions as boundaries; Austin and Searle's "speech acts," and the organization of "social meaning" that Gumperz and Labov found in linguistic variation and codeswitching. Goffman declared the relative analytical independence of an "interactional order" governed by a separate set of principles not directly related to larger social structures. There ensued a period of description, typologizing, and cross cultural comparison.

The second, more radical intellectual project was a double-edged critique, targeting both linguistics and social science as then constituted. Hymes's dictum was a classic performative, disguised as mere description: "... whereas the first half of the century was distinguished by a drive for the autonomy of language as an object of study and a focus upon description of structure, the second half was distinguished by a concern for the integration of language in sociocultural context ..." (1964: 11). This

project continues to inspire theory and research. It has produced detailed criticisms of mainstream linguistics, sociology and anthropology.

In the argument with generative linguistics, linguistic anthropology retained much of structuralist analysis, but rejected the asocial definition of language. What had been peripheralized became central in a series of changes in focus. Linguistic anthropology emphasized multilingual, stratified speech communities instead of the ideal hearer/speaker; performance instead of linguistic competence; linguistic repertoire and speech act instead of abstract grammar and sentence; speech acts and speech events instead of the disembodied sentence. As sources of evidence, contextually located and tape-recorded interaction replaced intuitions about grammaticality. Some of this dovetailed with European initiatives to study sentence level phenomena through their cohesion into larger units. In mainstream American linguistics, however, the subjects taken up by linguistic anthropology were relegated to subfields such as pragmatics and sociolinguistics.

In sociology, it was methods and epistemology that were attacked by language-centered approaches. Study of interaction highlighted the situatedness of all sociological descriptions, indeed the unavoidable role of the interviewer in shaping the answers that made up a sociological report. This insight about the 'reactivity' of measurement was recognized as important, but was so corrosive to sociological business-as-usual that it was isolated as the workings of a 'micro-order,' to be studied separately from the institutional, organizational and demographic issues that occupied the mainstream of sociology. Without theories of how micro and macro were linked, there was a continuing side-lining of language as subject matter, and the trivialization of interactional process as merely the enactment of patterns determined elsewhere, the faithful reflection of supposedly more powerful 'macro' forces.

The role of linguistic anthropology within anthropology was more complicated. The position of language was significantly transformed in the 1980s in two ways. First, through a redefinition of culture. Rather than a symbolic or cognitive phenomenon (the two previous approaches) culture came to be seen as a set of embodied practices within institutions; practices that, in certain conjunctures, could change the institutions themselves. 'Language' was often invoked as a powerful means of constructing reality. Ethnographies of speaking that analyzed race, gender, ethnic conflict or dispute settlement fit well into practice theories such as those inspired by Bourdieu, by Birmingham cultural studies, colonial studies and Gramscian notions. But even when

recognized as important, linguistic practice was rarely analyzed in any detail.

Simultaneously, a second enterprise was also launched, related to language but largely independent of linguistic anthropology. Under the influence of literary studies, anthropology mounted a reflexive critique of the poetics and rhetoric of anthropology's own prose genres, especially ethnographic monographs. Anthropologists joined continental theorists such as Foucault and Derrida in unpacking and undermining the idea of objective knowledge. Metadiscourse, texts, their materiality, their authorization, their ability to 'objectify' and devalue others, all took center stage in sociocultural anthropology. But these concerns were often separated from the classic ethnographic and comparative goals of the discipline. For linguistic anthropology, the poststructuralist philosophers' discussions of discourse, rhetoric and poetics as shapers of 'truth' and subjectivity rang familiar tunes – if in unfamiliar keys. As a result, they provoked spirited responses. This critical engagement was guided by the internal logic of linguistic anthropology itself during intensive discussions in the 1980s and 1990s. The debates with poststructuralism encouraged a synthesis within linguistic anthropology that was aimed at developing a processual, event-based, political economy of texts in social life, and a semiotic perspective on culture.

The overall project of linguistic anthropology remains the reshaping of linguistic theory from an interactionist and culturalist perspective, and the revamping of anthropological investigations of meaning and action from the perspective of a semiotically grounded understanding of language, culture and social institutions. Within these broad aims, the last twenty years have brought substantial revisions in theoretical concepts.

Concepts and Controversies

The orienting concepts discussed here are not strictly separable; there are overlaps and echoes among them. Each section traces continuities with earlier formulations, discusses points of recent controversy and consensus, and then outlines briefly the implications of current approaches in linguistic anthropology for both linguistic and anthropological theory.

Indexicality, Metalanguage, Materiality

The multifunctionality of language was a pillar of 1960s linguistic anthropology. Jakobson (1960) enumerated emotive, poetic, metalinguistic, phatic and conative (action) functions. These operate simultaneously. Depending on the nature and goal of interaction, some are highlighted more than others. Yet

linguistic anthropologists observed that in many cultural contexts experts and laypeople alike privileged referentiality, believing that the naming of things in the world and predication about them was the pre-eminent role of language. Early linguistic anthropology proposed the category of 'social meaning' to designate what is communicated through a disparate set of formal linguistic devices in which picking out a referent is only secondarily involved, or absent altogether. These included Labovian phonological markers of class or regional identity, speech levels, grammatical alternates specific to males vs. females, avoidance registers, and codeswitching between languages and dialects.

The conceptual unity of these phenomena has been clarified through more concentrated attention to the non-referential, metalinguistic and poetic functions of language. This has been done through a foundational critique of structural linguistics, fortified by a culturalist reading of Peircean semiotics.

The structuralist tradition of grammatical analysis, no less than western common-sense, implicitly relies on the assumption of a stable referentiality for linguistic units. Saussure created a semiotics in which signs link a concept (signified) with a sound image (signifier) in systems of value-creating contrast. But he left unanalyzed the circumstances under which signs would be instantiated. His form of structuralism is able to explicate the workings of grammar as a system of oppositions, sequences and substitutions. But severing an abstract system of types (*langue*) from their tokens in contexts-of-use (*parole*) had serious limitations. Most importantly, it could not analyze what Jakobson called 'shifters': linguistic phenomena whose referential value is not entirely fixed within an abstract system, but relies in part on features of the situation in which they are used. There is no type-level stability in the reference of 'I,' it varies with the instance of utterance, always identifying the speaker of the moment. More generally, not only reference but also the interpretations of speech acts, implicatures and presuppositions are necessarily linked to events of speech.

Thus, speech as social action is not adequately described as the 'putting to use' of a separately analyzed grammar. On the contrary, grammar is full of devices – deictics, tense, mood, evidentials – that gain their interpretation only in part from type-level contrasts, and in part as tokens of use in specific contexts. These phenomena make an autonomous grammar impossible in principle: to describe them fully one needs pragmatics. That is, the speech event in which they occur must be analyzed in ethnographic detail and systematically linked to linguistic form.

To do so, Jakobson drew on C. S. Peirce's triadic semiotic theory in which a sign is linked to an object

for an interpretant. Indexical signs, for Peirce, stand for their objects by virtue of a culturally noticed, real-world contiguity. In contrast to symbols, defined by Peirce as signs that stand for their objects by virtue of a general law, indexes simply point to their objects; they signal through a co-existence between the sign and the objects and speech events of its occurrence. In these terms, shifters are partially indexical, partially symbolic. As Silverstein (1976) argued, the linguistic phenomena earlier identified as having “social meaning” (e.g. phonological variants, codeswitches) are non-referential indexes, relying for their interpretation on their contiguity (indexicality) with contextual features of the speech event in which they occur. That is how a phonological variant can signal the social relations of the speakers in an event, their relation to the topic of talk and/or the nature of the event itself. Non-referential indexes can be placed on a continuum with shifters. Indeed, the philosophical work of Putnam and Kripke showed that any act of reference necessarily has an indexical component. Referential indexes (shifters) and non-referential indexes have two further significant properties. They need some metadiscursive frame in which to be interpreted (see next section). And they can be either presupposing or creative. If presupposing, then their use signals that some aspect of the context is taken for granted as existent; if creative/entailing, then the use of the form itself brings into social relevance (into apparent ‘existence’) the objects or categories with which the form is culturally associated.

By linking shifters and non-referential indexes, a Peircean analysis provides a conceptual unity to social indexicals and thus to what used to be called ‘social meaning,’ thereby clinching the case against an autonomous grammar. It also provides conceptual materials for an alternative theory of linguistic structure. Classic empirical studies of indexicals include Errington’s work on speech levels in Java; Silverstein’s re-analyses of Labovian phonological variables and of T/V pronoun usage in the history of English; Irvine on Wolof registers; Ochs on indexicals of gender and stance in language socialization; Duranti and Agha on honorifics; and Haviland on Australian avoidance register. Brown and Levinson handled politeness phenomena, which are also of this kind, with a decidedly different approach.

The presumption that referentiality and propositionality are the pre-eminent functions of language is part of an ancient western ideology. Not as old, but still powerful is the related idea that meta-language and poetic forms are mere ornaments to reference. Because language has so often served as a model of culture, these widespread assumptions have implications for anthropological theory. For instance,

Lévi-Strauss borrowed from structural linguistics the idea of distinctive features; ethnoscience borrowed generative grammar’s idea that there are rules of competence. Interpretive anthropology borrowed from philology the notion of text. In each of these otherwise different cases, it was the referential capacity of language that served as the model for culture. Culture, like grammar, was seen as organized symbolic content that could be extracted from the real-time social action and historical positioning in which it was created. This taken-for-granted move of decontextualization reproduced the Cartesian assumption of a chasm between world and word. Accordingly, approaches in anthropology that emphasized practice, political economy and materiality were assumed to be opposed to those concerned with meaning, representation and ideation.

In contrast, a linguistic anthropology that places indexicality and speech-as-action at the center of attention provides a different synergy with sociocultural anthropology. Propositionality, however significant, is recognized as a feature peculiar to language. It is least like the rest of culture. Instead, the indexical aspects of linguistic practices, as interpreted by metadiscourses, are among the best examples of cultural meaning-making. Indexical signs are not only linguistic; they are also gestural, visual and sartorial, among other modalities. They are not ‘reflections’ of some other, more (or less) important reality. Rather, they are constitutive of the real-time creation of social-material reality through interaction. Peircean semiotics, with its tripartite emphasis on the **object**, as mediated by the sign and interpretant, insists on the materiality of communication, and conversely on the semiotic organization of material practices.

Context and Contextualization

Speech events were a fundamental unit of early linguistic anthropology. Studies focused on their constituent features (e.g., speaker, hearer, topic), social functions and cross-cultural typologies (e.g., Gumperz and Hymes, 1972; Bauman and Sherzer, 1974). In the last few decades, the structural description of speech events has been transformed into a more flexible concern with the ‘context’ of discourse and performance, bringing several important changes in the understanding of context. Good overviews of these issues are offered by Bauman and Briggs (1990), and Duranti and Goodwin (1992). The notion of ‘context’ as a set of social, spatial and physical features surrounding talk was commonsensical but inadequate. It implied the possibility of infinite regress in the number of features; it neglected the perspective from which context was viewed; and it assumed a firm

divide between talk and context. The problem of infinite regress arose from the effort of the analyst to list exhaustively the factors that might affect the nature and form of the talk. In order to choose which of the many features are relevant, one must address the question of perspective. Features defined from the point of view of the analyst are useless for understanding social process; it is the selective attention by participants to aspects of the social surround that analysts ought to be describing.

Conversation analysts such as Schegloff, Sacks, Jefferson, Heritage, Charles and Marjorie Goodwin took as an axiom the importance of discerning what participants orient to on a moment-by-moment basis in the local management of sequential talk. Participants need not share perspective among themselves any more than they do with the analyst. They might well have to negotiate a definition of the situation. Context then becomes a joint accomplishment. Infinite regress is avoided because it is the participants who together signal when 'enough is enough,' or defeat each others' attempts to include more (or less) of the surround. Such signaling is not necessarily propositional speech, yet is certainly communicative. Talk itself signals the frames for its own interpretation, supplying the cues for what is to be taken as its own context. There is no firm divide between a strip of talk, its co-text (linguistic context) and its sociocultural context.

It is not context, then, that is of interest, but contextualization: how participants attend to on-going discourse, conveying their assessments, evaluations, presuppositions as well as predictions about the definition of the activity that is occurring, the event-specific roles of the participants, the intentions of speakers, the direction the activity is likely to take, as well as unexpected switches in all of these. This process relies on culture-specific folk theories about social actors, intentions, events and goals, while recreating those very categories in the process of communication. These theories are not necessarily shared. What Putnam observed about the lexicon is equally apt here: in any group there is likely to be a division of linguistic labor and of the expertise it requires. In addition to local knowledge, contextualization relies on the universal metacommunicative capacity of language, and on the universal ability of speakers to attend to and respond to metamessages about the relationship of talk to its surround.

The several concepts that have been crafted for the analysis of this metacommunicative process differ in certain respects, but bear a family resemblance. Lucy (1993) provides a good review of these. Bateson proposed 'framing' to denote metamessaging that signals some activity to be play or not-play. This is common even among many non-human animal

species. Chafe and Fillmore made linguistic use of this formulation. Goffman (1979) extended it with his notion of the footing or stance taken in an interaction, and the participant roles or role fragments – such as 'author' 'animator' 'principal' of an utterance – that are thereby evoked. Philips described participant structures, and Cicourel proposed the notion of schema for related phenomena. Gumperz (1982) introduced contextualization cues to name the many kinds of linguistic signals (e.g. prosody, codeswitching) from which one infers what kind of activity is in effect. Silverstein (1993) distinguished between metasemantics, by which speakers define the meanings of words, and metapragmatics. Metapragmatic discourse is explicit commentary or evaluation of language use (e.g. that some event was gossip). Metapragmatic function, by contrast, is implicit signaling to suggest which cultural frame or activity is in effect. Bakhtin (1981) and Voloshinov proposed literary analysis of reported speech and voicing as metacommunicative devices that present the perspective of one speaker on the speech of another. Bauman (1986) showed that performance is itself reflexive: the speaker assumes responsibility for speaking well, thereby drawing attention to the code and poetic forms through which speech genres are created and thus expectations about them are signaled.

A crucial aspect of framing or voicing is the possibility that frames can be embedded in other frames; they can be transposed and projected both forward and backward in time. Furthermore, speakers create interactional tropes, treating interlocutors and events 'as though they were someone/something else,' thereby achieving novel communicative and social effects. As part of such effects, voices can be reported in quotation or in various forms of indirect discourse. Social interaction is thus an endless lamination of narrated events and the narrative events within which the stories are told. For linguistics this implies a complexity in patterns of pronouns, tense, evidentials, discourse markers and anaphora that signal such embeddings of frames. These cannot be handled without theorizing indexical phenomena. For sociocultural anthropology the embedding of frames and their interpenetration during narratives and conversation allows analysts to understand processes such as the relationality of personhood and the fragmentation of selves, as well as subject formation, role-distance, and the cultural conceptualization of what counts as authenticity. It is a small example of the reality-constructing processes involved in reported speech that the speech reported need never have happened, or not in the way reported. Yet the report – culturally framed as, say, gossip, journalism, court testimony, or oracle – can have far-reaching consequences in shaping subsequent social relations.

Framing and the propositional content of talk always occur simultaneously. Metamessages allow the analyst to track participants' interactional moves in an encounter. These moves (the interactional text) include the open-ended set of acts that can be done with words: promises, teases, threats, and the unnamed, more general alignment or antagonism among speakers. These acts are accomplished in part by small observable behaviors such as sequencing, body position, and conversational repair. But they are just as importantly accomplished by the ways in which the names for objects and actions that are the subject matter of talk are selected from the many equally accurate denotational labels available. As Schegloff (1971) pointed out for the limited case of place-names, how one formulates a label is always relative to a particular event of talk, that is, indexical. Selection of a term that picks out a referent involves a delicate (and not always conscious or aware) negotiation of social relationships, assumptions about participants' levels and types of knowledge, hence their identities and social location. In turn, the use of one rather than another referring expression is creative/performative. The difference between 'dine' 'take a repast' 'chow down' or 'put on the old nosebag' is not only a matter of lexical register. Each claims a speaker identity, positions speakers with respect to each other, with respect to the event, the referent, and to the cultural discourses indexed by the labels selected. Framing and the indexicality of reference together accomplish contextualization: the moment-by-moment means through which interaction creates and transforms social relations.

Text and Entextualization

There is an irony in the effort of linguistic anthropology to discern how participants contextualize stretches of discourse. For scholars themselves spend most of their time ripping snippets of discourse out of context in order to translate, transcribe and analyze them. The process of decontextualization is a key (reflexive) step in social science methodology. Yet the examples of transposition, reporting the speech of others, and embedded frames discussed earlier show that decontextualization is just as familiar from everyday life. It is the flip side of contextualization. This is what Bakhtin evocatively characterized as our mouths being full of other people's words. It has been a focus of analysis in linguistic anthropology for the last two decades.

Close analysis of the process requires a distinction between 'text' and 'discourse.' 'Text' is any objectified unit of discourse that is lifted from its interactional setting. 'Entextualization' is the

process of transforming a stretch of discourse into such a unit of text, undoing its indexical grounding by detaching it from its co-text and surroundings, yet taking some trace of its earlier context with it to another setting which is thereby changed and which reciprocally transforms the text itself. Certain formal properties can enhance the likelihood of entextualization. For instance, poetic features of cohesion, or genre conventions can signal a boundary to an interaction, therefore a chunking of text. But any stretch of discourse can enter into interdiscursive relations by which it seems to be recalled, repeated or echoed in further discourse. It can be picked out and seemingly frozen as text, to be involved in further intertextual relations that link it to previous and subsequent versions of text. Interdiscursive and intertextual links create the impression that text fragments 'circulate' across texts, events and among speakers.

The linguistic means of entextualization are the same metadiscursive signals that are essential for contextualization: devices of framing, cueing, metapragmatic discourses and functions. For the purposes of linguistic analysis, it is necessary to study the transformations that discourse undergoes as it is entextualized and then (re)contextualized. Footing or genre might change, as might indexical grounding (as signaled by changes in deictics of person, space and time). The function of the text might also change (e.g. from everyday act to ritualized tradition). New forms, functions and meanings may be emergent in the newly re-contextualized text. And there are questions of access, power and inequality involved in the social arrangements that constrain what sorts of persons and statuses can entextualize in what institutional settings. Processes widely analyzed under other names – translation, codeswitching, glossing, among others – are amenable to further scrutiny in these terms. Furthermore, by cultural definition, some texts are more or less accessible for de- and recontextualization.

The anthropological implications of this line of work extend in at least three directions. First, such analysis can reveal how the social magic of authority – political, legal, epistemic – is created in and across interactions. The relationship between narrated event and the story-telling event in which it occurs is a delicate nexus at which to 'calibrate' voicing through the projected relations of teller to tale, to audience, to source, and to previous and subsequent events and tellings (Silverstein, 1993). Through metapragmatic framing, speakers can construe the interactive event that is recounted as being distinct from the on-going event of talk (reportative calibration), or as the same event (reflexive calibration), or as emanating from some other epistemic realm such as

the sacred, the universal, or mythic (nomic calibration). Within specific institutional settings, these calibrations create different sorts of authority: claims to knowledge, or claims to (and the social effect of) speaking as/for the people, the ancestors, the gods, or the laws of science. Contests over the metapragmatic framing of sources for statements can create (and destroy) the authority of texts and hence the power of speakers. As Silverstein and Urban (1996) note, a significant part of politics is the struggle to entextualize authoritatively. Linguistic practices, then, are the very grounds of politics, not the medium, description or reflection of them. This includes the assignment of responsibility and blame, credibility and doubt. Hill and Irvine (1993) show that across widely different cultural settings, such attributions are managed through metapragmatic devices such as reported speech and the distribution of voices across participant roles.

Second, the processes of entextualization and links among texts (intertextuality) allow a deeper understanding of temporality, spatiality and social connectedness. Despite the undeniably linear, sequential ordering of speech, there is no single 'now' in interaction. Any utterance is weighted with the earlier source from which it can be heard to have originated, and the implicit future recounting in which it might participate. The interdiscursive links among interactional contexts can be extended and projected without temporal limit (Irvine, 1996). Even within a single narration there are often layered successions of retellings which, embedded in each other, can make traditionalization visible as a temporal process. Similarly, study of intertextuality can highlight systematic relations among events in spatial extension, inviting scholars to rethink the relation of face-to-face interaction and what used to be called 'larger social structures.' This will require further theorization of the various kinds of linkages between interactions. For instance, we need to know how circulation – a shorthand term for intertextual links, echoes, repetitions – has differential 'reach' across interactions that are distinguished according to their degrees and types of institutionalization, geographical range, political economic consequentiality, form of mediation as broadcast, print, or face-to-face talk. The phenomenon of translation (linguistic, cultural) deserves considerably more attention in these terms, as it too is a form of multiply layered intertextuality.

Finally, there are methodological implications of this perspective on text. Social science research always involves reflexive language. Jakobson remarked that there could be no linguistics without metalanguage, as scholars have to ask for glosses, acceptability judgments and paraphrases. The reactivity of fieldwork

became an issue for sociocultural anthropologists of the 1980s, (just as it had for sociologists in the 1960s) when they noted that fieldwork is 'dialogic.' It is not the positivistic observation of an object by a subject but an encounter between two subjects – the informant and the anthropologist – with different relevances, values, and different sets of ultimate audiences in mind. Much of the subsequent critical commentary focused on issues of objectification in ethnographic writing. Less attention was paid to the fieldwork encounter itself as dialogic and mutually objectifying. Like any interaction, fieldwork and interview are always susceptible to the confusion of mismatched or even incommensurable metapragmatic signals among interactants that Gumperz called 'cross-talk,' and that is made worse by power differentials. This is less a problem specific to anthropological research than an insight about the nature of human interaction. As Mannheim and Tedlock (1995) have remarked, the people anthropologists study have been 'objectifying' each other well before the arrival of the fieldworker. The task is to specify what kinds of objectification and incommensurability in metacommunication are operating, and how.

Language Ideologies

Language ideologies are cultural conceptions about language, its nature, structure and use, and about the place of communicative behavior in social life. Useful definitions and exemplary studies are presented in Woolard and Schieffelin (1994) and Schieffelin *et al.* (1998). Ideas about speech and language are common in all social groups and are as culturally diverse as linguistic practices themselves. In the linguistic anthropology of the 1960s the study of language attitudes and native models of politeness, language variation, honorifics and appropriateness were grist for cross-cultural typologies and comparisons. These research themes, along with others detailed below, are unified under the rubric of language ideology.

The term 'ideology,' though polysemous, most often evokes ideas connected to politics and power. Such concerns have a long pedigree in linguistic anthropology. Boas as public intellectual brought anthropological and linguistic evidence to bear against racist science and anti-immigration policies. Overtly political concerns about inequality and race were also present in the 1960s, for instance in the debates among Bernstein, Hymes, Gumperz, Kay and Labov on the existence, value, and consequences of 'restricted codes' in working class and Black speech. Current controversies that have strong political implications include the increasingly global hegemony of English, the linguistic mediation of inequality, the future

of endangered languages, and the stigmatization of multilingualism and of certain accents and dialects. What is different today is scholars' reflexive analysis of communicative processes in their own work and in large scale politics.

Language ideologies always include metapragmatics, that is, local suppositions about the relation of speech forms to speakers' identities and their social situations. But language ideologies are never only about language. They include whatever other conceptual systems are taken to be relevant to language by the speakers and institutions under study. In the analysis of language ideology, as in the study of metapragmatics, there is a split between those approaches privileging explicit, propositional content, and others that focus on implicit ideological patterns inscribed in linguistic, institutional, ritual and other material practices. Language ideologies are never unitary and so the study of ideology commits the theorist to a perspectival approach. As Woolard has emphasized, one must ask: whose ideology is at issue and in what practices and institutions is it sited. There are likely to be contradictions among ideologies. For instance, Bateson's notion of the double bind consists of two contradictory ideological (meta) messages, delivered in different modalities simultaneously. There is also likely to be contestation among ideologies evident at different social locations. Nor are ideologies likely to be shared within social groups in a world characterized by linguistic divisions of labor. In a single population, language ideologies inscribed in the practices of schooling can conflict with or override those evident in families, friendship networks or other institutions, raising questions about the relative authority of different ideologies.

Early discussions of 'linguistic ideology' emphasized the tendency of explicit ideological statements to rationalize and thereby distort linguistic practices. Boas and Bloomfield saw speakers' models of their own speech as obstacles to genuine linguistic analysis. More recently, scholars have noted that there is no access to linguistic materials except through the filter of metalinguistic assumptions – whether these are the assumptions of speakers and/or of analysts. Current use of the term 'language ideology' considers such filters not as regrettable distortions but as part of the perspectival nature of ideologies, their necessary partialness and partiality. This includes the perspective of linguists. Language ideologies are grounded in social position and experience, in moral and political stances. But they are not an automatic reflex of these. Rather, ideology mediates between social position and linguistic practice in diverse domains. Students of language socialization (Ochs and Schieffelin, 1994) have shown that children do not simply learn linguistic

skills. Rather, local ideologies mediate between talk itself and assumptions about the proper relationship between childhood, talk and forms of mothering. Similarly, in the study of literacy, Collins finds that language ideologies add their own contributions as interpretive filters, defining who can be expected to read and write in what way and for what purpose, thereby contributing to the creation of many distinct forms of literacy. The linkage between linguistic practices and categories of identity is also mediated by language ideologies. How are maleness and femaleness indexed in speech? When such indexes appear in interaction, other dimensions of social life – such as the expression of desire, sexual activity, typified emotions, rank and social position – are entailed, in part on the basis of local cultural images of masculinity and femininity (Cameron and Kulick, 2003).

By viewing language ideology as an inescapably perspectival lens on social interaction, linguistic anthropology engages in debate with neo-Marxist lineages of ideology-critique. Some studies in linguistic anthropology have marshaled evidence from language use to challenge social theorists' proposals about the workings of symbolic domination and cultural hegemony. Other work has reconsidered influential formulations about ideology by Bourdieu, Foucault, Althusser, Žižek and others to reveal their unexamined assumptions about language and semiosis. Social theorists of ideology often and unreflectively rely on implicit linguistic models that, because they seem commonsensical or self-evident, help to make their theories more persuasive. Most generally, ideologies that present themselves as concerning language can work as displacements or coded stories about political, religious or scientific systems; ideologies that seem to be about religion, political theory, human subjectivity or science are often implicit entailments of language ideologies, or the precipitates of widespread linguistic practices. The term 'displacement' can be further analyzed here as a form of voicing. However, to recast a language debate as a coded dispute about religion, aesthetics, morality or politics is not, in itself, an explanation. Rather, the goal of analysis in studies of language ideology is to show **how** such a displacement works in semiotic terms, how it is instantiated in practices, and how it legitimates, justifies or mediates action in quite other areas of social life. Conversely, a particular definition of language may itself be made more credible by its connection to other, non-linguistic, sociopolitical concerns and especially to their supporting institutions.

Ethnolinguistic nationalism provides a familiar example. Over several centuries, European philosophical and political practice did the ideological work of making the connection between the cultural

categories of 'language' and 'nation' appear a necessary, natural and self-evident one, united as much in everyday political practice as in scholarly arguments. This occurred in part through the establishment of a science of language that defined a bounded and unified object of study ('language') as a natural entity, out there to be discovered. The ideologically constructed unity of language-and-culture in a populace was seen as the ultimate source of political authority: those who spoke one language constituted a 'people' whose united voice would replace the authority of imperial rule. By this logic, any group claiming to speak the same language could use that fact as proof of its nationhood and thus justification for a state of its own. A somewhat different example of authority through language ideology is the political theory of the 'public sphere' as guarantor of democratic politics. According to European notions of a public sphere, as dissected by Habermas, the worth of a speaker's argument is judged not by speakers' social status. Ideally, democratic citizens make anonymous contributions to policy debate and to critiques of the state. It is the form and rationality of their contributions, not their identities, that is supposed to guarantee the fairness of a democratic polity. From the perspective of this theory of democracy, it is evident that a model of ideal linguistic interaction underpins the semblance of impartiality and hence the legitimacy of democratic process (Gal and Woolard, 2001).

It is not only politics that is legitimated by images of language and social life. Bauman's study of Quakers and Keane's more recent report on Christian missionizing both suggest that the relations envisioned between speakers and listeners within these religious communities implied forms of interiority and intentionality that became models for various forms of Christian belief. Other forms of belief are also underwritten by understandings about language in social life. For instance, Shapin's historical account of 17th century science shows that polite conversation among gentlemen was the model that, when transferred to gentlemanly interaction at the Royal Society, created the credibility and assumed replicability of early scientific experimentation. In these examples, linguistic ideologies underpin social institutions, providing the supposedly self-evident background that authorizes new social forms.

Language ideologies are cultural frames. As such they have their own histories, which are instantiated and circulated in specific institutions and genres of speech and writing such as the etiquette book, instruction in oratory or realist novel. Another such genre in the west is linguistic philosophy. Its analyses are supposedly universal, yet very much rooted in the history of European cultural understandings about

language. While the notion of 'intentionality' of the speaker is a key term in western philosophy of language, comparative study shows this to be but one historically specific version of an interiority-centered language ideology. As Duranti and Rosaldo have shown, in many social groups outside of Europe, inferences about speakers' intentionality are not decisive or indispensable in the interpretation of speech acts. Bauman and Briggs's study of the western philosophical tradition focuses mainly on Herder and Locke, tracing the historical conditions out of which emerged the regimentation of linguistic practices that would subsequently count as examples of 'folklore' on the one hand, and 'objective speech' on the other. Another such genre is linguistics analysis itself, especially as it has intersected with colonial projects. Historical studies show how language ideologies fit into fields of debate with which they are contemporaneous, and that concern other, diverse matters: the nature of human difference and inequality, competition among scholarly disciplines, or the competence and vision of a particular monarch's ruling group.

Differentiation: Registers, Communities, Variation and Change

Speech community, linguistic repertoire, variation, register and style are among the foundational concepts of linguistic anthropology. Adopted from earlier frameworks of research, they were redefined by the work of the 1960s. In the last twenty years they have been transformed once again in light of the notions of indexicality and metapragmatics/ideology. In any social group, images linking typical persons to typical activities and typical linguistic practices draw on culturally salient and elaborated principles of differentiation (e.g. presupposed notions of caste or occupation, folk theories of gender and personhood) that are often perceived by participants as necessary and inherent distinctions. These ideological principles – axes of differentiation – mediate between social and linguistic characteristics and orient the practices and relations of interactants. Speech communities and language communities are emergent effects built out of such axes of differentiation.

Linguistic variation often appears to speakers (and to analysts) as a reflection or diagram of social differentiation. A famous example is the finding by Labov and his students that phonological variables correlate with situational style and the socioeconomic status of speakers. The analytical task is to specify the ideological – or more precisely the semiotic – processes by which these correlations arise and become significant. Why and how do particular chunks of linguistic material coalesce into

recognizable and nameable ways of speaking (registers) that gain significance as signs of particular populations, activities, settings, and are heard as appropriate to certain events. Furthermore, how is it that in any interaction, the expected correlations can be subverted or transposed, thereby signaling quite unexpected messages?

The extension of a Peircean theory of signs has been productive in approaching these issues. Linguistic features that form co-occurring clusters or registers are indexical of (point to) categories of speakers who regularly use them, or to situations and activity types in which the features regularly occur. But not all real-world co-occurrences form indexical signals. The co-occurrences must be noticed and formulated within some cultural or ideological system. To make such linkages and render them meaningful for speakers often requires extensive discursive efforts and the effects of media circulation. Another means of establishing meaningful indexicalities is through ritual and institutionalization. When both the ways of speaking and the people or activities are typified, schematized and conceptually linked, the result is a system of registers that evokes a system of stereotypes. Formulations of referents in minute-to-minute interaction rely on these associations. Registers often include not only linguistic material but also other signaling systems such as clothing, demeanor and gesture. Linguistic-forms-in-use that are thus ideologized as distinctive and implicating distinctive kinds of people can always be resignified, further ideologized (or misrecognized) as emblematic of other social, political, or moral characteristics in what Silverstein has dubbed multiple orders of indexicality.

Another of Peirce's sign relations – iconicity – is key in differentiation, according to Irvine and Gal (2000). Peirce distinguished between indexes that point to their objects and icons that share the qualities of their objects, for some interpretant (e.g. a theory or ideology). In sociolinguistic differentiation, there is always a *set* of contrasting indexes pointing to contrasting objects in a relation that Peirce would call diagrammatic iconicity. Furthermore, the indexical links between linguistic signs and speakers, characteristics or events are understood not simply as a co-occurrence but a sharing of quality. When an index is thus perceived as an icon, the resulting sign is a Peircean 'rheme.' Essentialization is in part constructed semiotically, through the perception that the sign and the object are iconically linked. A system of such contrasts, salient at one level or scale can be projected, in a fractally recursive manner, onto other scales of social and linguistic relation, either broader or narrower. This allows for the proliferation of the same or similar difference at greater and smaller

scales. Social or linguistic aspects of the sociolinguistic scene that do not fit such systems of stereotypes are semiotically erased. That is, they are ignored, backgrounded and sometimes physically eliminated.

When a system of such indexical signals is the basis of social interaction, then participants can have fairly strong expectations about communication. Even if the participants do not share what is usually called a single language, they recognize the kinds of speech that signals different sorts of people and activities, and a speech community can be said to exist. Note the similarity to the Prague School's notion of *Sprechbund*. Since precolonial times, networks of exchange, commerce, travel and exploration have been creating speech communities that are diverse in social function, stability and extent. It is important to make an analytical distinction. Speech communities consist of people who can interpret each others pragmatic, indexical signals to varying degrees. Language communities are groups of people bearing loyalty to norms of denotational system. Usually the denotational form receives a name – English, Swahili, Taiap – and is imagined as bounded and separate from other comparable units. Language communities emerge as cultural system in the context of heterogeneous speech communities when difference in denotational practice is ideologized as significant. Thus contact and interaction – not isolation – produce distinct language communities.

Language communities, although always characterized by loyalty to code, are nevertheless culturally distinct. Sometimes a single person's speech is recognized as exemplary and aesthetically pleasing. In other cases the form of speech used in a certain setting or event (kiva, longhouse, oratory) is considered the model worthy of emulation. More common in the world today is the language community that is linked to a state system and oriented not to beauty but to standardized forms of correctness, monitored by language academies, school systems and grammar books. Named languages do not simply exist in the world. Through institutions they are constantly being made and reconstructed, their boundaries policed and defended. In the process of consolidation, standard languages often become gate-keeping devices in national labor markets, providing speakers who control them with increased access to jobs and other resources (Bourdieu, 1981). But the value of standard languages does not derive from such direct market activity; rather their market value depends on semiotic processes of differentiation.

Speakers who are incorporated into colonial empires through bureaucracy, trade, or conquest, but do not speak the language of the state, come to see their own linguistic practices through the eyes of

the powerful center. Therefore, they come to see themselves relationally, as peripheral. For such populations, the switch in perspective produces novel self-understandings as 'minority' 'local' or 'indigenous.' In states organized as democratic and multicultural, legitimating one's indigeneity or minority standing requires at least partial adoption of the state's standardizing ideology. Whatever their own ideologies about linguistic practice, such populations must often produce a denotational code different enough from others to count as a 'language' of their own. For many decades, such 'local' languages were the special province of anthropological linguists, whose descriptions deliberately erased – as inauthentic – the contact languages and multilingualism that tied indigenous speakers to their neighbors and colonial rulers. Part of the problem is that Euro-American linguists' notion of language as morpho-syntax-with-sound pattern is often at odds with local definitions that focus on lexical co-locations, place names, prosodical features and textual organization. These differences acquire increased significance when indigenous languages are considered endangered. The question of what merits documentation becomes a highly consequential matter, argued by scholars, by courts, and among members of the language community. As Hill and others have shown, whatever counts as linguistic knowledge in indigenous communities often endows its owner with authority and access to local resources. The position of Euro-American linguists as experts and arbiters in these matters is rife with moral contradictions that have been a focus of professional writing in recent years.

The exploration of metapragmatics and language ideology has produced new approaches to language change. Change is often the unintended consequence of people attending to linguistic structures through the prism of their own language ideologies, limited as these are by cognitive constraints on awareness and sociopolitical framings of what is significant. Increasing linguistic differentiation occurs through patterns of schismogenesis among interacting speakers, or conversely through simultaneous use of genetically different denotational codes in codeswitching (Heller, 1988). Codeswitching itself become the focus of loyalty, thereby producing a new language community. Other processes of differentiation result in language obsolescence, or contrariwise in language revival and the creation of 'heritage' languages for diasporic populations (Dorian, 1989). Also common is the commodification of language or linguistic practice for touristic purposes and the concomitant 'ethnicization' of local denotational codes when they co-exist with a standardized state language. In this process there are often structural changes in the

local language that mark it as iconic of the group with which it is identified. Ideologies of 'modernity/tradition' 'male/female,' 'purity/dirt,' and presuppositions about typified emotional states, notions of self, and quite local political issues, all can mediate between the socioeconomic situations of speakers and the forms of language change they experience (Gal and Irvine, 1995). Ideological framings of difference penetrate significantly into grammar.

A semiotic analysis of differentiation has implications for the study of processes beyond linguistic practices. The tendency for nationalisms to recursively evoke internal divisions of the populace into foreign-natives vs. native-natives is well explained by the semiotics of differentiation. In colonial and imperial circumstances, details of cultural practices have been interpreted as evidence of the relative 'humaneness' of conquered populations in contrast to conquerors. Projections of this kind are not presupposing indexes of existing features, but creative (performative) acts that bring into interactional relevance the very iconic similarities they seem to be merely describing. In yet another form of differentiation, speakers adopt the Goffmanian 'figures' of others. That is, they take on, for varying periods of time, the registers, objects and activities seen as iconic of others in acts of Bakhtinian mimicry, quotation, parody and/or admiring emulation. By attending to the semiotics of differentiation linguists study the dynamics of heteroglossic social orders.

Language and Thought

Whether and how grammatical categories influence habitual thought and 'perceptions of reality' are among the oldest concerns of anthropological linguistics/linguistic anthropology. They were first raised for European science by colonial exploration and contact with languages whose grammatical structures seemed exotic in relation to the patterns familiar from study of geographically more proximate populations. In one way or another such differences worried Boas, Sapir, and Whorf, and well before them inspired Humboldt, Herder and Condillac. The issue has continued to draw scholarly interest throughout the 20th century.

If one were to consider the social power to be gained from the ability to define social 'reality' – as in Gramsci's cultural hegemony, Foucault's discourse, Bourdieu's doxa – then this set of questions would parallel those raised in the rest of linguistic anthropology. Characteristically, however, studies of linguistic relativity have taken a narrower view of linguistic practices, and have considered neither power nor a socially located and mediating ideology. Positing a more direct relation between language and thought, they have studied psychological and cognitive process-

es in themselves. There is currently a reversal in this trend, however, bringing studies of linguistic relativity closer to the issues of identity formation, politics, conflict and social differentiation that characterize the rest of linguistic anthropology. Recent work suggests that issues of translation, register and interaction will become as important in studies of linguistic relativity as they are increasingly becoming in other areas of linguistic anthropology. Two reviews provide excellent guides to the state of research and its disputed history: Hill and Mannheim (1992) and Gumperz and Levinson (1996). It will suffice here to note some areas of consensus among scholars, before taking up three contested issues to give a sense of the debates and the way terms such as language and thought have been redefined.

These matters are agreed: First, linguistic relativity (or the so-called Sapir-Whorf hypothesis) is not a hypothesis to be 'tested' but an axiom or starting point for research. Grammatical categories, to the extent that they are obligatory or habitual and relatively inaccessible to speakers' consciousness form a privileged location for reproducing cultural and social categories because they constrain the ontology taken for granted by speakers. There is no assumption about the coherence of entire 'world views' in this as in any other corners of anthropology. Second, although evidence of universals in human cognition has been thought to undermine a search for language-specific cognitive phenomena, all researchers acknowledge both. The interesting questions concern the relative strength, nature, sequence and role of universals vs. cultural-linguistic specificities and what those specificities might be. Third, it follows that Whorfian effects exist. This is hardly surprising given the discussions above about creative indexicality and projections. Finally, research priorities have shifted during the 20th century. Due in part to the Chomskyan 'rationalist' program in linguistics, the cognitive turn in psychology, and the empirical results of Berlin and Kay's (1969) research on color terminology, universals took center stage in the 1970s. Currently, there is a renewed interest in Whorfian effects from a number of different perspectives.

Turning now to contested issues, the first concerns the category 'grammar.' Whorf proposed that languages differ in the grammatical **analogies** they make. By handling substantively different lexicon within the same grammatical frame, they invite speakers to treat the otherwise different items in a similar way. Thus, English treats days, years and months not as cyclical events but with the same grammatical devices as ordinary object nouns. English speakers expect – by unconscious analogy – to count time in the same way as they count tables. They ask about the substance out of which days are made, on the analogy of wood as the substance out of which tables are made. Hence the

objectification of time as a substance. Such analogies are unquestioned background assumptions. They become apparent to analysts if one analogy system is compared to another that provides different hidden parallels. Careful methodology is fundamental here: when two systems are compared, neither can be taken as the standard or metalanguage for the other.

Some theorists suggest that the privileging of morphosyntax and its effect on semantic categories is misplaced, in a world of multilingualism. Friedrich proposed instead that the tropic or 'poetic' aspects of language, inflected by ethnopoetics, will differ most across cultures. (This echoes cognitive linguists' claims that habitual metaphors structure thought.) Similarly, if the poetic form of narration changes during language shift, there is a loss of a distinct cultural pattern for organizing experience. Others counter that narrative organization signals merely a difference in the way that experience is packaged for the purpose of talk, and is not necessarily reflective of cognition. This formulation runs into trouble, however, if people must use obligatory linguistic categories to encode experience in order to plan for future recountings.

A second set of arguments starts from experimental or cognitive psychology and the presumptive priority of universal cognitive processes. For some, linguistic relativity is not an issue because they assume language and cognition to be isomorphic, with thought as 'inner speech.' Linguistic relativity is also irrelevant for domains assumed to be unmediated by language: physical, musical or craft skills that are thought to be coded in somatic schema. Theories about universals of thought derive also from the Kantian tradition that takes categories of time, space and cause as the fundamental grounds of human reasoning. For many domains, there are also likely to be universal constraints imposed by the nature of the domain itself, and the specialized anatomical and neurophysiological adaptations of humans to a concrete world: wavelength for color; gravity in the case of space. Even in the realm of language there might be universals of structure or lexical organization. What does linguistic specificity add to such universals? Levinson suggests that in the case of space and possibly many other domains, linguistic relativity is still powerfully involved. Universals substantially *underdetermine* the possibilities of conceptual solutions to describing spatial arrangements.

A third controversy takes up Hymes's early suggestion that there is a linguistic relativity of language use as much as of linguistic structure. Populations differ in the genres and events they recognize. Interpretations that participants derive from utterances are always dependent on sociocultural context. Thus, the fit between language and thought is mediated by habitual practice; social interaction

and cultural beliefs (ideologies) about the everyday world. For instance, deictics of space are found in all languages. Nevertheless, as Hanks (1996) argues, they encode culturally specific information, and they map social and experiential fields, not objective spaces. Thus, cultural schema of several kinds mediate between the use of a deictic term and its proper interpretation. Furthermore, these frames and schema are not always equally available to all speakers in a community. A linguistic division of labor is often evident, as is the consequent necessity to negotiate meanings between interactants. Clearly, this brings to the study of linguistic relativity questions of indexicality, entextualization and ideology. For the study of linguistic relativity the implications are significant: There might be as much variation between speakers in their access to alternate perspectives and theories as there is across 'cultures.' Furthermore, distinguishing between 'language' 'culture' and 'thought' is at best a rough methodological tactic. The object of investigation for linguistic anthropology, in current practice, is exactly 'culture' as a process that is simultaneously semiotic, interactional and linguistic.

Linguistic Decolonialization

A Jaffe, California State University, Long Beach, CA, USA

© 2006 Elsevier Ltd. All rights reserved.

Linguistic decolonization describes both the actions taken in postcolonial contexts to undo the social, political, and cultural effects of the dominance of colonial languages and a philosophical challenge to the Western language ideologies that underpinned the colonial project and that have persisted in the postcolonial period. A wide view of ‘colonization’ includes not only the classic cases of Western expansionism but also ‘internal colonialism’ involving indigenous and minority populations within the nation-state (see **Minorities and Language**). We can speak of linguistic decolonization in a multitude of contexts, ranging from new state formation in Africa and Asia and the former republics of the Soviet Union to indigenous language planning in the Pacific, North and South America, to minority language movements in Western Europe. Given this vast scope, no pretense will be made here to cover all possible contexts and the vast literature in language planning and postcolonial studies; rather the aim is to outline some of the common features and challenges of documented processes of linguistic decolonization and what they have to say about language ideologies and policies in general (see **Linguistic Rights**).

Linguistic decolonization always takes place within a nationalist project: either as an element of new nation-building, or as an effort to legitimate languages and identities that were unrecognized or actively suppressed under colonialism. Linguistic decolonization projects have thus been preoccupied with redressing linguistic inequality and cultural oppression in the public sphere, particularly in education and in official/governmental life, by replacing all or part of the colonial language’s public functions with one or more local, indigenous, or minority languages.

Projects of linguistic decolonization are thus profoundly shaped by dominant ideologies of language and nationalist ideologies about how language is related to cultural and political identities. These ideologies include the central premises that languages are ‘natural’ and clearly bounded entities that map onto equally natural human boundaries; that there is an essential or primordial link between a single language (conceived of as the ‘mother tongue’) and a single/unitary identity (either personal or collective).

A combination of social, ideological, and pragmatic issues complicate the process of linguistic decolonization and its goals of democratization and cultural

legitimation for previously colonized groups. On the practical level, in postcolonial contexts it is rare that linguistic decolonizers have access to all the material and political resources needed to replace the status and functions of the colonial language in all domains. It is also the case that both local and global political economies of language are resistant to challenges to those powerful, former colonial languages. This is because those languages often still constitute social and political capital at the local level, where they can be used by local elites to legitimate their social positions.

Second, those languages (particularly English) have currency in new, global markets, motivating postcolonial social actors to embrace dominant language education in search of economic mobility despite the cultural value of schooling in the minority or indigenous language.

It is also the case that when minority or indigenous languages are ‘developed’ in the image of the colonial languages they replace, language planning efforts (normalization, officialization, standardization, codification) have the potential to create new forms of linguistic hierarchy. First of all, language planning policies may favor particular languages or dialects and thus their speakers. In some cases, those hierarchies are accepted by the population, to the benefit of particular speakers. In other cases, this political dimension of language policy ends up creating a permanent crisis of legitimacy that prevents postcolonial language planners from reaching any consensus. More generally, the introduction of minority or indigenous languages in the spheres of literacy and education inevitably creates a divide between ‘good/pure’ and ‘bad/mixed’ codes and validates new forms of expert linguistic knowledge owned by a minority.

With respect to linguistic purism in postcolonial contexts, two points can be made. First, it is an outcome of dominant ideologies of authoritative language (see **Power and Pragmatics**). Second, as a result of contact with the dominant language, both the form and use of the dominated language are inevitably ‘mixed’ and therefore stigmatized, once ‘high’ forms of that language are introduced. The issue of linguistic purism highlights the difficulty of resisting or challenging the single language/single identity premise of the nationalist project. At the political level, agents of linguistic decolonization are often forced to legitimate noncolonial languages in dominant terms because those terms are imposed by powerful gatekeepers. In addition, there is the question of the ‘colonized mentality’: the fact that the validity of dominant ideologies of language, including the denigration of nondominant languages, has often been internalized

by the general population. Postcolonial linguistic agents are often faced with a double-bind: if they use the colonial language, they are seen as traitors to their cultural/ethnic group; if they use the dominated language, their voice has a more limited power and reach (see **Pragmatics: Linguistic Imperialism**).

Truly radical linguistic decolonization projects would thus have to challenge the fundamental premises of dominant linguistic and cultural ideologies and practices. These radical forms of resistance involve the legitimation of plural or hybrid linguistic forms, practices, and identities, including the appropriation and reworking of colonial languages. This kind of linguistic decolonization is rare in the public sphere, although it can be seen in some indigenous education projects and is more noticeable in domains of artistic, creative linguistic practice.

Linguistic Habitus

I Gogolin, University of Hamburg

© 2006 Elsevier Ltd. All rights reserved.

This article is reproduced from the Concise Encyclopedia of Sociolinguistics, pp. 650–652, © 1994, Elsevier Ltd.

Pierre Bourdieu's (1981) concept of habitus denotes a modality, which enables the individual to act routinely as well as creatively and innovatively.

Central to Bourdieu's theory is the attempt to describe the dynamic relationships between the structural conditions of an individual existence, the individual's activities as a product of socialization under these conditions and the open-ended yet strictly limited capacity of the individual for action. In the process of socialization (see **Socialization**), a system of permanent dispositions is created in the individual, including sensitivity as one prerequisite for

personal development. This system of dispositions and sensitivity is a necessary precondition for successful social activity.

Bourdieu emphasizes a circularity between 'structure,' 'habitus,' and 'practice.' Habitus functions as an awareness-matrix, an action-matrix, and a thought-matrix for the individual; however, it does not alone determine behavior. A habitus is acquired under a certain set of social conditions, which Bourdieu calls 'objective structures.' To these belong the existential requirements, which characterize and define a social class. A habitus therefore is generated and regenerated by the specific objective structures of a class, and at the same time define and redefine, generate and regenerate the lifestyle and practice of its members. Bourdieu describes this circularity as follows: habitus function as "structured structures, which are suitable to function and work as structuring structures" (Bourdieu, 1979: 167). Implicit in a habitus is a tendency toward self-stabilization – despite the fact that socialization is not completed until death. New experiences are integrated in a habitus that leads to its constantly changing form while remaining relatively stable.

The term 'linguistic habitus' thus refers to the set of dispositions in the field of language: to a person's notion of linguistic 'normality' and of 'good' language, to a society's notion of 'proper' ways of language behavior, of 'legitimate' language variations and practice. The term does not describe language as a means of communication in a narrow sense, but refers primarily to the symbolic relations and signs by which language becomes a medium of power. Gogolin (1994) defines the monolingual habitus, which is common to the classical European nation states as an example of a linguistic habitus. In the process of their foundation in the 18th and 19th century, the basic and deep-seated belief was created that monolingualism is the universal norm for an individual and for a society (cf. Hobsbawm, 1990). This idea was disseminated and traditionalized by institutions of the nation-state: jurisprudence, military forces, political, and administrative bodies. Probably most influential for the creation and dissemination of these fundamental elements of the concept of nation-state were the modern state school systems, which were established simultaneously to the foundation of the nation-state as such. Linguistic homogenization was the main motive for the development of public education systems. The establishment of one national language and of a monolingual national society was (and often still is) seen as essential for the success of the nation-state, especially at the economic level.

In reality, hardly any nation in the world ever had a monolingual population. In most countries – especially in the Australasian, Asian, and African world, but also in Europe – people speak more than one, often many languages (see **Bilingualism**). Despite this reality, the deep-seated belief in monolingualism as natural in a society governs individual and public opinions towards language and language practice. In the cases of European nation-states, this preference becomes obvious in connection with immigration. Roughly one-third of the people under the age of 35 years in the member states of the European Union are migrants, speaking other languages than the national language(s) of the respective state (see **Migration and Language**). For example, in the year 2000, more than 350 languages were spoken by children in London schools. Nevertheless, the European state school systems act as if they had monolingual populations. The teaching is centered on the 'legitimate' language of the state or the area, that is to say the national language or the official language of the region. The other languages are rarely taught at schools; children stay illiterate in their second or third language they live in. Consequently, they are unable to develop their other languages towards the most elaborated state (see **Bilingual Education**). By these mechanisms, the hierarchy and power relations between languages become stabilized. Those who have no or less access to the legitimate language are at risk of being excluded from participation and equal success in a society.

The linguistic habitus is the governing mechanism of these processes. The notion of linguistic normality was traditionalized in history, despite multilingualism. There is no collective remembrance of these historical events; the fact that this notion once was created and implemented explicitly has disappeared from collective memory. According to Bourdieu's theory, a habitus functions the better, the less conscious its owner is about it.

A variation of the monolingual habitus seems to be at work in multilingual nation-states as well, due to the fact that there is usually one selected language of power. This choice may not be a national language. In colonial or postcolonial situations especially, the language of power very often is not a national language, which by constitution has legitimate status. Instead, it is the language, which guarantees survival and success in the linguistic market – mainly the language of the former colonists. Whereas in Europe, the standard national languages are usually considered the legitimate variant, in colonial situations symbolic power is linked to the languages of the former oppressors (cf. Goke-Pariola, 1993). The linguistic

habitus ensures the relative stability of these situations, and thus contributes to the durability of societies of marked disparities in power between different social groups.

Linguistic Rights

Central Concepts

All the rights that individuals, groups, organizations, and states have in relation to languages (their own or others) are linguistic rights or language rights (LRs). Languages may similarly have rights. Strictly speaking, only binding rights (coded in laws or regulations of various kinds) count. In most cases, these also include a duty-holder who has to see to it that the rights can be enjoyed. A state or a regional authority can, for instance, have the duty to organize education through the medium of a certain language for certain individuals or groups in a specific place. In addition to rights proper, there are many nonbinding recommendations, declarations, and other nice intentions and wishes about LRs.

An individual in a specific country may have the right to use her or his mother tongue in various contexts, for instance in dealing with authorities, local, regional, or state-wide, orally or in writing or both; the authorities do not necessarily need to reply in the same language. The mother tongue is often for legal purposes defined in a strict way, as the first language that a person learned, and still speaks, and with which s/he identifies. A definition often used in situations where forced assimilation of indigenous peoples has made the older generation speak the dominant language to their children, is sometimes much less strict: a mother tongue, with LRs connected to it, is defined as a language which is, or has been, the first

language of the individual her-/himself, or of (one of) the parents or grandparents.

Often, it depends on how many individuals there are in a country (area, region, municipality, etc.) whether individuals (speakers or signers) belonging to that group have any LRs; the group has to have a certain size. Two of the most important European LRs documents, from the Council of Europe, use group size as a criterion, but do not in any way define it: The European Charter on Regional or Minority Languages, and the Framework Convention on the Protection of National Minorities, both in force since 1998, use formulations such as “*in substantial numbers*” or “*pupils who so wish in a number considered sufficient*” or “*if the number of users of a regional or minority language justifies it.*” (See the latest news about these documents and their ratifications at the Council of Europe. The treaty numbers are 148 and 158).

If an individual can use the right to all mother tongue medium services anywhere in her or his country, we speak of a principle of personality. Usually, only members of large groups with excellent protection have this kind of right, which in most cases is restricted to the dominant language speakers in a country. Often, such speakers are not even aware of how precious these rights are, and how unusual it is to possess such rights for any of the world's linguistic minorities (or even some linguistic majorities: e.g., in several African countries, the old colonial languages still have more rights than the indigenous African languages have). If LRs are connected to a specific region, such as is the case in Switzerland, where German-speakers can use their language in official contexts only in certain cantons, while French, Italian, or Romansch-speakers can use their

respective languages only in certain other cantons (where German speakers do not have the right to use German), we speak of a principle of territoriality. That means in practice that if Italian-speaking Swiss parents want their children to be educated through the medium of Italian, they have to live in the only canton (Tessin) where this is a right.

Many international organizations and most states have language policies that spell out the official languages of the organization or state and, by implication, the LRs of the people, groups, and states dealing with, and working within, that entity. The United Nations has six official languages, the Council of Europe only two (English and French). The European Union has several times increased the number of its official languages, such that after its latest expansion, in May 2004, the Union now has 20 official languages; all official documents have to be made available in all of them. Many organizations also have working languages; their number may be more restricted. A number of states have only one official (or state) language; most have two or more (English is *an* official language in more than 70 states; see Skutnabb-Kangas, 2000). South Africa has 11 official languages, India 22. In addition, many states specify one or several national, additional, link, or national heritage languages in their constitutions; in most cases, these have fewer rights than the official languages have (see de Varennes, 1996).

Linguistic Human Rights (LHRs)

The very recent and still somewhat unclear concept of Linguistic Human Rights (LHRs) combines language rights (LRs) with human rights (HRs). LHRs are those (and only those) LRs which, first, are necessary to satisfy people's basic needs (including the need to live a dignified life), and which, second, therefore are so basic, so fundamental that no state (or individual or group) is supposed to violate them. Some basic rights prohibit discrimination on the basis of language (negative rights); others ensure equal treatment to language groups (positive rights). There are many LRs which are not LHRs. It would, for instance, be nice if everybody could, even in civil court cases, have a judge and witnesses who speak (or sign) this person's language, regardless of how few users the language has. Today, it is mostly in criminal cases only that one has a linguistic HUMAN right to be informed of the charge against oneself in a language one understands (i.e., not necessarily the mother tongue); in all other contexts, people may or may not have a LANGUAGE right, depending on the country and language; in the best cases, interpreters paid for by the state are used. Likewise, it would be nice if the following demands were to be met:

All language communities are entitled to have at their disposal all the human and material resources necessary to ensure that their language is present to the extent they desire at all levels of education within their territory: properly trained teachers, appropriate teaching methods, textbooks, finance, buildings and equipment, traditional and innovative technology.

But such demands are completely unrealistic and cannot be considered part of LHRs. (They come from Article 25 of the 1996 Draft Universal Declaration of Linguistic Rights.) At this moment, only a few dozen language communities in the world have these kinds of rights; this has to be seen against the background of the fact that there are some 6500 to 7000 spoken languages (and perhaps an equal number of sign languages) in the world (see Ethnologue; see Skutnabb-Kangas, 2000, Chapter 1, for the unreliability of the statistics).

Two kinds of interest in LHRs can be distinguished. One is "the expressive interest in language as a marker of identity," the other an "instrumental interest in language as a means of communication" (Rubio-Marín, 2003: 56). The expressive (or noninstrumental) language rights "aim at ensuring a person's capacity to enjoy a secure linguistic environment in her/his mother tongue and a linguistic group's fair chance of cultural self-reproduction" (Rubio-Marín, 2003: 56). It is only these rights that Rubio-Marín calls "language rights in a strict sense" (Rubio-Marín, 2003: 56); in other words, these could be seen as LHRs. The instrumental language rights "aim at ensuring that language is not an obstacle to the effective enjoyment of rights with a linguistic dimension, to the meaningful participation in public institutions and democratic process, and to the enjoyment of social and economic opportunities that require linguistic skills" (Rubio-Marín, 2003: 56). So far, it is not at all clear what should and what should not be considered LHRs, witness the lively ongoing debates about the topic.

Language is one of the four most important human characteristics (among many others that are also listed in human rights instruments) on the basis of which discrimination is never allowed (the others are gender, 'race,' and religion). Still, language often disappears in the educational paragraphs of binding HRs instruments. One example: the paragraph on education (§ 26) of the Universal Declaration of Human Rights (1948) does not refer to language at all. Educational linguistic human rights, especially the right to mother tongue medium education, are among the most important rights for any minority. Without them, a minority whose children attend school, usually cannot reproduce itself as a minority: it cannot integrate with the majority, but is forced to assimilate to it.

Binding educational clauses of human rights instruments have more opt-outs, modifications, alternatives, etc., than other Articles of such instruments have. One example is the UN Declaration on the Rights of Persons Belonging to National or Ethnic, Religious and Linguistic Minorities in 1992 (emphases added: ‘obligating’ and positive measures in *italics*, ‘opt-outs’ in **bold**):

- A. States *shall protect* the existence and the national or ethnic, cultural, religious, and linguistic identity of minorities within their respective territories, and *shall encourage* conditions for the *promotion* of that identity.
- B. States *shall adopt appropriate* legislative and other measures to achieve those ends.
- ...
- 4.3. States **should** take **appropriate** measures so that, **wherever possible**, persons belonging to minorities have **adequate** opportunities to learn their mother tongue or to have instruction in their mother tongue.

The Council of Europe’s *Framework Convention for the Protection of National Minorities* and *The European Charter for Regional or Minority Languages*, both in force since 1998, also have many of these modifications, alternatives, and opt-outs. The Framework Convention’s education Article reads as follows (emphasis added):

In areas inhabited by persons belonging to national minorities traditionally or in substantial numbers, if **there is sufficient demand**, the parties shall endeavor to ensure, as far as possible and **within the framework of their education systems**, that persons belonging to those minorities have **adequate** opportunities for being taught in the minority language or for receiving instruction in this language.

The opt-outs and alternatives (‘claw-backs’) in the *Charter* and the *Convention* permit reluctant states to meet the requirements in a minimalist way, something they can legitimize by claiming that a provision was not ‘possible’ or ‘appropriate,’ or that numbers were not ‘sufficient’ or did not ‘justify’ a provision, or that it ‘allowed’ the minority to organize teaching of their language as a subject, but at their own cost.

Without binding educational linguistic human rights, most minorities have to accept ‘subtractive’ education through the medium of a dominant/majority language. In subtractive language learning, a new (dominant/majority) language is learned at the cost of the mother tongue, which is displaced, leading to diglossia and often to the replacement of the mother tongue. Diglossia means a situation with functional differentiation of languages, e.g., one at home and in the neighborhood, another for use at school and with authorities.

Assimilationist, subtractive education of indigenous and minority children is genocidal; it fits two of the five definitions of genocide in the *UN International Convention on the Prevention and Punishment of the Crime of Genocide* (E793, 1948):

Article II(e): “forcibly transferring children of the group to another group,” and

Article II(b): “*causing serious bodily or mental harm to members of the group*” (emphasis added; see Skutnabb-Kangas, 2000 for details).

The human rights system should protect people in the globalization process, rather than give market forces free range. Human rights, especially economic and social rights, are, according to human rights lawyer Katarina Tomasevski (1996: 104), supposed to act as *correctives to the free market*. She claims that “The purpose of international human rights law is ... to overrule the law of supply and demand and remove pricetags from people and from necessities for their survival.” These necessities for survival thus include not only basic food and housing (which would come under economic and social rights), but also basics for the sustenance of a dignified life, including basic civil, political, and cultural rights. It should, therefore, be in accordance with the spirit of human rights to grant people full linguistic human rights.

Literacy Practices in Sociocultural Perspective

J Collins, University at Albany, SUNY, Albany, NY, USA

© 2006 Elsevier Ltd. All rights reserved.

Introduction

This article discusses some of the things meant or intended when researchers refer to ‘literacy practices.’ One meaning is that the researchers will treat literacy as an event in which the (arti)facts of inscription cannot be separated from persons, settings, and other communicative modalities. In addition to this descriptive aim, the term also usually signifies a theoretical ambition. Across multiple disciplines of social inquiry, reflecting the legacy of thinkers such as Sahlins, Williams, Foucault, Giddens, and Bourdieu, the term ‘practice’ has come to signify a range of theories and frameworks that grapple with the interplay of structure and construction, history and agency (Ortner, 1984). Although a literacy event may be as personal and fleeting as jotting down a list or glancing at an advertisement, literacy understood as the making or interpreting of inscriptions has a history of many millennia, and is closely associated with long-term and large-scale enterprises, such as cities and states, armies and schools, extensive markets and world religions. Relating the personal to the large-scale, the fleeting to the enduring, subject to structure, is thus a challenge confronting the study of literacy practices.

The term ‘New Literacy Studies’ (NLS) denotes a broad framework, drawing together various critical approaches within the field of literacy studies, consciously built upon the notion of literacy as a **practice**, rather than, say, a psychological skill or abstract social property. Within the NLS framework, literacy practices have been explicitly discussed as entailing a twofold research intention: (a) to build upon the notion of literacy as a communicative event, itself derived from the anthropological ethnographies of communication paradigm, but also (b) to push analysis beyond events to the ideological framing and institutional contextualizing that gives particular events their broader significance (Street, 1993). In this effort, NLS work has drawn particular inspiration from the ground-breaking research of Shirley Heath on literacy events, and it has used the anthropological notion of ‘cultural model’ to explore relations between consciousness and institutions. It has also, however, been informed by European and English traditions of critical discourse analysis, which call for the study of language as a social practice, an approach to language/society informed by Marxian analyses of ideology and hegemony and Foucault’s

arguments about discourse, knowledge, and power (Rogers, 2003).

In what follows, I first discuss work in the latter ‘New Literacies’ (NLS) framework, then indicate amplifications and framings suggested by sociocultural perspectives drawn from anthropology and linguistic anthropology (LA), arguing that the differing approaches only partly overlap. The article concludes by addressing contemporary literacy problems in the US and the complementary strengths and weaknesses of the two approaches (NLS and LA) in thinking about those problems as well as in providing frameworks for more general understandings of the phenomena of literacy and practice. It goes without saying, an article of this scope will unavoidably be schematic, citing only directly relevant work, leaving much that is worthwhile unmentioned and treating as settled much that deserves further argument.

Literacy Practices in the New Literacy Studies

As noted above, within the NLS approach, priority is given to studying literacy events, the situated doings that involve acts of reading, writing, or both. Highly influential early work was that of Heath (1983), who showed that in home, school, workplace, or church, what was an issue was not a binary contrast between literacy and orality, but rather the socially situated and culturally mediated events – whether reading a bedtime story or reading the mail, filling in a job application or composing a prayer for a church service. Participating in such events, people not only decoded or encoded text but were socialized into and enacted particular views of what reading or writing might be, who took what roles in such events, and how they were part of larger-purpose endeavors: bringing up children, going to school, getting and keeping a job, expressing faith. In calling attention to the fact that acts of inscription and interpretation were part of a more general communicative economy, Heath’s studies were part of a more general inquiry, also undertaken by historians and literary scholars, into the relations between orality and literacy (see Gee, 1996, for one review).

With the breaching of boundaries between written text and spoken event, the question of context is sharply raised, or in a more specific analytic idiom, the issue of indexicality is posed. Shuman (1986), in an in-depth study of working-class girls’ “fight stories,” emphasized that the right or authority to provide an account (that is, to be or not be talking

behind someone's back, itself grounds for an altercation) depended on particularities of relationship and situation, not on the communicative modality of speaking or writing *per se*. Drawing upon work by Garfinkel and Sacks, she noted that "all utterances are indexical . . . [that is,] all utterances have multiple possible meanings and any particular meaning is an **understanding of context** (Shuman, 1986: 119, emphasis added)." Arguing that the principle of indexicality extended to inscribed utterances, she argued that "The recognition of indexicality admits the possibility of multiple interpretations of text (Shuman, 1986: 120)." The theoretical recognition of indexicality, and the practical possibility of multiple interpretations of text, means that there can in principle be no strict line between text, context, and interpretation. The point is not simply that multiple interpretations are possible, which is true but uninteresting in itself. Rather, it is that which interpretations gain authority is a matter of social dynamics, involving actors and institution-based understandings, as well as inscriptions.

The second aspect of the NLS understanding of literacy practices is that practices necessarily involve a cognitive-ideological dimension – of cultural models and implicit theories regarding what counts as reading or writing. One of the more systematic treatments of literacy models, Bialostok (2002), analyzes interviews with a set of middle-class parents, arguing for a "white middle class model of reading," in which the reading of prose (fiction or non-fiction) in books is given near-exclusionary status. In Bialostok's analysis, the statements that interviewees make, such as "Reading is part of me" or "I can easily gorge down a novel a day," are expressions of metaphors which **indirectly index** a cultural model in which reading is a proxy for morality (Bialostok, 2002: 351). In this model, reading is recurrently talked about as a moral act of worthy consumption, and a series of interesting metaphors are attached to this textual consumption. Book reading is sustenance, it fills readers up; indeed, they can 'devour' or even 'binge' on books. Reading books is a fitting part of the good person: "Books fit in with my life," says one respondent; "Reading is something that's just part of me," says another (Bialostok, 2002: 356). The person who doesn't read (books) is often characterized as "missing a lot of things" (Bialostok, 2002: 357). Book reading produces economic well-being: "Books have enriched our children's lives" says one respondent. But its lack points to poverty: "It's just so sad when a child doesn't have any books or isn't read to. They have such impoverished lives," says another interviewee (Bialostok, 2002: 359). As Bialostok argues, this is not just a matter of variation in culturally specific

conception of reading, coherent and articulated through interlocking images, and anchored in the institution of the middle class family. It is also that this is the model or theory of reading promoted by the child-rearing professions of the contemporary US and, in particular, the school. It is a model that recognizes and gives legitimacy to certain class-associated literacy practices, while ignoring or derogating acts rooted in other systems of value (see also Heath (1983)).

An important point about positing what we might call an ideological level of models and implicit theories that are part of literacy practices is that, as with language ideologies more broadly, such conceptions and theories mediate between real-time micro-interactional events, and institutional orders, that is, perduring social classifications, organizational forms, and activity types. In his ethnography of literacy on the Pacific atoll of Nukulaelae (Tuvalu), Besnier (1995) shows that letter writing gains its full significance within a configuration linguistic, cultural, and social features that include Nukulaelae lexical and grammatical categories of affect, norms for face-to-face conversation, norms for gender-based emotional expression, and extensive labor out-migration. Most pertinent to our current theme, Besnier shows that the strong evangelical religion practiced on the island provides weekly enactments, through sermons, of gendered personhood and authority.

In Besnier's account, Nukulaelae sermons feature a blending of literate and oral resources: sermons are written beforehand, but preaching styles draw on other ritual genres as well as biblical passages. For many Nukulaelae, sermons are key events in which religious authority and a public search for truth is performed, displayed, and claimed. The sermon is part of a more general fundamentalist epistemology: "... Scriptures are the ultimate arbiter of truth. If they abide by the authority of God and the Bible, humans can gain access to the unambiguous truth that is otherwise beyond their reach (Besnier, 1995: 141)." This pursuit of truth is done by individuals evoking and commenting upon the sacred scripture in written sermons: "[the composition and performance of which] centralize an individualistic sense of personhood and the search for the truth (Besnier, 1995: 138)." But the sermon is part of – that is, it reflects, expresses, and reproduces – an institutional hierarchy of gender and knowledge: though women as well as men may preach, only men can write a sermon.

That conceptions of reading or writing include assumptions about categories of person appropriate to a given activity is, of course, not surprising. The exclusion of women from Koranic or Talmudic scholarship is well known; enlightenment intellectuals

in Europe and Colonial North America assumed that Blacks, whether free or enslaved, were incapable of writing; and in pre-Revolutionary America, it was normative that the virtuous woman should read, but not “take up the pen,” especially for public expression (Warner, 1990). Such ideological framing of literacy events, combining cultural classification (e.g., male/female, white/black) and institutional site (e.g., the school, the pulpit, the press), shows that concepts of literacy practice must extend beyond the observable event.

Literacy Practices in Sociocultural Perspective

The New Literacy Studies has been largely an undertaking of educators, anthropologists, and sociolinguists who have successfully critiqued earlier claims about literacy as a context-independent “technology of the intellect” and called into question many school-based and official definitions of literacy (Street, 1984; Gee, 1996). As a research program it has, however, been less successful in areas germane to a sociocultural perspective on literacy practices. These areas include the following: (a) registering the consequences of the artifactualization of language wrought by inscription and the technical-institutional distribution of such text-artifacts, (b) analyzing the ideological range that accompanies literacy endeavors in comparative, global perspective, and (c) attending to institutional and social structural influences on literacy practices outside contemporary Western states and school systems. I address each of these themes below.

Artifactualized Language

One undeniable aspect of inscription is that it turns language into a thing, it renders some element of language (words, syllables, phonemes) into an artifact, into marks made in some medium (clay, papyrus, paper, acetate). These artifacts can, in turn, become input for procedures of accumulation and distribution of varying scale. Despite the untenability of Jack Goody’s general conception of literacy, one value of his extensive research is his emphasis on procedures of accumulation and distribution of text-artifacts as essential processes in the evolution of social complexity. In what is otherwise a critical assessment of Goody’s 1986 monograph, *The logic of writing and the organization of society*, Collins and Blot (2003: 20) have written:

A general virtue of *LWOS* is that it provides constant reminders of the semiotic dimensions of social complexity. An endless keeping of lists seems to accompany

social undertakings of any significant scale: censuses of population undertaken by states and lists of priest-officiants maintained by temples are prime examples. Book-keeping emerged early as a primary function: if not *the* primary function of inscription in Mesopotamia, and it figured in subsequent temple, palace, and merchant economies in the Ancient Near East.

As if in complement to Goody’s *The logic of writing and the organization of society*, Olson (1994) developed an extended inquiry into philosophies and practices of reading in the intellectual traditions of Western Europe. He argues that a written textual representation is important because as an artifactualizing of language, it suggests a model of language. This model inclines users to become (a) aware of the dimensions of language represented (say, letters or words) and (b) troubled by what is **not** represented, that is, by what is left unsaid. In Olson’s account, an historical confluence of ideological, institutional, and technological developments in Western Europe results in a general model of reading-faithful-to-the-text, which arose out of medieval and early modern religious debates, was given substantive diffusion by the development of universities, printing and print-capitalism, and entered into debates in 16th- and 17th-century science about how to best read the *Book of nature*. As articulated by Francis Bacon and other early modern philosopher-scientists, the model of reading became part of a doctrine of truth based on precise records, in “unadorned style,” in experimental and other natural scientific inquiry. This concern for realistic, replicable representations of the natural world, in turn, gave impetus to developments in various representational media which flourished in the 17th–19th centuries: portrait painting, map-making, and botanical drawing. These representation media themselves became print artifacts, mechanically reproduced, extensively distributed, and mediating far-flung engagements in a world being transformed by capitalism and colonialism.

What is often called ‘the print revolution’ was a central element in the production and distribution of artifactualized language. Historians of print (Eisenstein, 1968) have described the cultures of print emerging along with the new technology developed by Gutenberg in Germany in the 1450s, and they have described the very rapid spread of both production sites and book artifacts. As noted in Crosby’s (1997) suggestive analysis of the role of measurement and representation in European science and technology: “By 1478 they were printing in London, Cracow, Budapest, Palermo, Valencia, and a number of cities in between. By the next century millions of books had been printed (Crosby, 1997: 231).”

The widespread diffusion of print artifacts, and especially books and newspapers, gave rise to new ways of viewing language, space, and time, encouraging, in turn, new ways of imagining both collectivities and individual nature. For Eisenstein, what she called “the uneven rise of reading publics” led to new forms of individual development. She argues that with the spread of books, lives became more procedure-bound as individuals and groups began “going by the book” (Eisenstein, 1968: 39). Such “going by the book” was a textual ethos and practice characterizing a “‘middle class’ secular puritan” ethos found in Protestant Europe and North America, in which domestic handbooks, marriage guides, and etiquette rule books were paramount in the conduct and judgment of lives. Eisenstein suggests that the new literate individualization also contributed to the envisioning of and identifying with new collectivities, in particular, the nation-state.

This line of argument has been influentially developed by Anderson (1991), who argues that wide dissemination of newspapers and novels provided textual materials for imagining new spatial and temporal orders, for which the language-codifying nation-state was both instrument and outcome. A more historically and culturally nuanced account of such processes is provided in Warner’s (1990) analysis of letters, literacy, and political categories in late colonial and early national U.S. history. In his account, foundational concepts such as ‘citizen’ are linked to social divisions – such as those between men and women, whites and blacks – and to particular textual practices, such as collecting personal libraries, practicing journalism, and selling an ‘American literature.’

We now live of course in an era not of ascendant nationalism but of globalization, wrought not by printing press but by computing machines and their communicative infrastructure. Space considerations do not permit much discussion, but there has been considerable interest, debate, and writing about this most recent development in the production and distribution of text-artifacts. We need not need enter the debates of whether the digital technologies are revolutionary newcomers, or merely new communicative modalities interacting with older modes, whether they herald an era of dystopian or utopian postliteracy (Warschauer, 1999). But we should note that with digital as with alphabetic literacy, artifactualized language provides ways of mediating communication, channeled through existing and emerging institutional forms, typically with official inducements for appropriate use and sanctions of inappropriate use, and typically also accompanied by an underground of subversive, wayward practices.

Sociocultural Practices of Language Use Associated with Inscription and Artifact Circulation

In the preceding section I focused upon the artifactualizing of language brought about by inscription, some of the major developments in the production and distribution of such artifactualized language, and some of the historical, institutional, and psychological developments associated with these communicative economies. These latter include the rise of states and general religions, the development of science, nationalism, and the rule- (or book-) bound self. It is ethnocentric and crudely techno-deterministic to argue, as some have, that the alphabet, *qua script*, causes modern science. I agree with Brandt (2001), however, that the many students of literacy practices have gone too far in denying a technical dimension to literacy, giving short shrift to technical-institutional interactions and political economic dynamics in the history of literacy.

This concern registered, it is also important to stress that there are always cultural variations in the way literate resources are taken up and put to use. Indeed, to its credit, the NLS framework has always stressed such variation. Given its concern to critique official, dominant understandings, it has not, however, brought out the playful, subversive uses of literacy; such transgressive uses often highlight the cultural shaping of literacy practice.

Burke’s (1988) ‘The uses of literacy in Early Modern Italy’ gives a picture of literacy practices in a flourishing mercantile city state. Not surprisingly, we learn that in the 16th-century city state of Florence there was a robust notarial culture in which merchants kept extensive accounts and engaged in voluminous correspondence as they tracked expenditures and profits over far-flung trade networks. Also not surprisingly, we learn of secular, sacred, and patriarchal efforts at regulation: the Florentine state pioneered the use of written passes in order to regulate subjects’ travel; the Church issued tickets that were collected at communion, part of a record book registering attendance and nonattendance; and literate Florentine males proposed what Burke calls a “rule of female illiteracy (Burke, 1988: 38).” This latter prohibition on who should read and write seems to have been caused by a familiar patriarchal plight: fear of wayward female sexuality, more particularly, that literate wives and daughters might get up to no good by trafficking in love letters. The state, for its part, feared unauthorized reading of its correspondence and pioneered the use of ciphers for encrypting correspondence. The Counter Reformation Church was troubled by both literacy and illiteracy. Literates

were problematic because they might read heretical works, such as those being busily produced and disseminated by Protestant printers to the north. Illiterates, on the other hand, were worrisome because they were fond of and susceptible to superstition and magic. And the illiterate majority of early modern Florence had access to **written** magic: spells, incantations, and medical cures that used alphabetic sequences (such as *abracadabra*), printed and otherwise inscribed on cards, amulets, and other objects, in order to evoke and control the supernatural.

There is a small but interesting body of research showing that in colonial and postcolonial settings, hybrid forms of spiritual practice involve non-Western peoples appropriating the idea of supernatural powers of sacred text. This is the case among the Mende of Sierra Leone, who make spells and talismans with fragments of Classical Arabic (Koranic) script (Bledsoe and Robey, 1993); it is also the case with the Gapun villagers of Papua New Guinea, who manipulate Biblical text in search of the material benefits promised by Cargo religion (Kulick and Stroud, 1993). Basso's (1990) description of an indigenous Apache writing system reports the case of Silas John, a mission-raised Apache who in early adulthood experienced visions in which God apparently imparted knowledge of 62 prayers and a system for writing them down. The writing system was novel in form, drawing upon both English orthography and Apache sand-painting designs. After his visions, Silas John became the prophet of a neotraditionalist religious movement, gathering a select band of twelve disciples, to whom he taught his system of writing. He and his followers then used the writing system to record prayers and other instructions for use in rituals. In short, Silas John drew upon the idea of the power of **divine writing**, creating a written code, knowledge of which was necessary to successful performance of ceremonies. A traditional practice of rites was continued, but only through the agency of new literates, readers who controlled access to the divine through their manipulation of esoteric script. A case strikingly similar to this one, and roughly contemporaneous, is that of the Aladura movement in colonial Nigeria during the 1920s. It also involved a prophet, Oshitelu, who also received prayers in a vision, along with a writing system for recording them. Oshitelu's writing system was distinct from English orthography, in which this prophet had also been schooled, and thus was accessible only to the specially trained (Probst, 1993).

In a recent study of practices of magical writing in Highland Ecuador, Wogan (2004) describes how the villagers of Salasaca attribute life-threatening power to acts of writing and erasure. Wogan argues that

many practices of magical writing are a mirror-image of the Ecuadorian state's concern to record all indigenous peoples in its Civil Registry. In a campaign advertising the need to register new births, the slogan *Si el niño no está inscrito, es como si no existiera* ("If a child is not registered, it's as if he doesn't exist") is proclaimed on posters and television (Wogan, 2004: 52). Conversely, Salasacans attribute life-threatening power to placement of a name in the book of San Gonzalo, a local saint. Hence the mirror-image: if a child's name is not registered in one book, the Civil Registry, it is "as if" he or she does not exist; if a name of a person is placed in another book, that of San Gonzalo, that person is in mortal danger, until they have their name removed (which erasure eliminates the supernatural threat).

Ideologies of Language and Literacy

As should be apparent from the foregoing discussion of religious and magical literacy practices, the existence of text-artifacts and their use in specific local settings is often overlain with a strong evaluative dimension, that is, an ideological layering. The view that a letter, a word, or a name or a passage in a book gives access to supernatural beings and powers is a belief, an idea about language, and an element in a framework for relating practices with language artifacts to concerns at once worldly and otherworldly. The idea that some given language or form of language has special powers is widespread, and the so-called world religions are well-known for their linguistic orthodoxies. I will illustrate two cases. For Muslims, Classical Arabic is the only language in which the holy Koran may appropriately appear; for Roman Catholics, until recent decades, Latin was the only correct language for the liturgical service. Aspects of this religious belief in the divine nature of specific languages clearly recurs in the nationalist equation of "a (n artifactualized and print-disseminated) language and a people," an equation of essentialized language and political-cultural community, which has informed political struggles and education policy throughout the world (Anderson, 1991; Bauman and Briggs, 2003).

Sometimes the focus of ideological reasoning is not language *per se* but the particular script in which the divine is both evoked and represented. This is apparent in the Apache and Nigerian cases described by Basso and Probst. Such cases in turn reflect a more general state of affairs: that orthographies (systems of inscription) are never neutral phenomena. They are instead often the object of sharp controversy over the best (i.e., the most authentic or scientific) way to represent a given language. The varied conflicts and their constituencies, sites, and orthography-ideas are

discussed in research on language revitalization movements in Europe, South Asia, and the Americas (see, for example, the papers in Fenigson, 2003).

In a more abstract fashion, thinking about literacy has incorporated specific assumptions about orthographic development and social evolution. Goody and Olson, for example, put forth claims about an “alphabetic mind” as part of arguments about the supposed superiority of alphabetic over other writing systems. Such claims were quickly refuted by anthropologists and comparative psychologists (see Street, 1984, for a general review), but they reflect an old legacy in Enlightenment thinking about literacy and society. Rousseau, in his writing on the social contract, posited an equivalence between kinds of inscription and stages of society. The scheme went like this (see discussion in Collins and Blot, 2003: 166–167):

- Savagery (non-state societies) = Picture writing
- Barbarism (non-Western Asiatic states) = Hieroglyphic writing
- Civil Man (Western states and empires) = Alphabetic writing

This evolutionary hierarchy recapitulates other now-discredited hierarchies of culture, thought, and language, but with a focus on orthography rather than grammatical form.

In yet other cases, it is neither a given language or script that is central to the ideologizing of literacy practices, rather it is the encounter between a superposed world language/religion and local beliefs about both language and the supernatural, resulting in novel construals of uses of artifact-language. This is the situation reported by Kulick and Stroud (1993), in which Gapun villagers apply pre-existing theories of hidden meaning in language to their readings the Christian Bible, as they seek passages which will unlock the secrets of Cargo wealth. Such an encounter is also the object of Pulis’ (1999) study of Rastafarian citing-up, a reading practice which emphasizes playing with the **sound** of scripture in order to tap meanings hidden by the literal or denotational meanings of the text. In some cases, the holy language can be used for other supernatural purposes, which are organized in accordance with local practices. In Bledsoe and Robey’s discussion of Mende, ritual specialists substitute “Muslim magic” for indigenous magic and sorcery: “A *moriman* uses his command over Arabic writing, which is widely regarded as the literal word of God, to obtain God’s assistance. He evokes a verse’s power by writing it on paper, rolled into a tight wad and tied with string or inserted in a small amulet pouch (Bledsoe and Robey, 1993: 118).” Note in this case the condensation of talismanic power and artifactualized language: the verse, written in

“the literal word[s] of God,” is compacted into a tight wad and inserted into an amulet pouch.

A theme explicitly discussed in Wogan’s work on magical writing is that occult uses of literacy are often in counterpoint to the official organization of literate practices in the service of state functions. For the Ecuadorian state, the practice of registering people and land is part and parcel of being a modern society. Salasacan magic writing is, of course, viewed as a premodern superstition, albeit one that shares a belief in the life-defining efficacy of writing in books. The general point here – that literacy practices are intertwined conceptions of modernity – has been widely discussed. An early and highly controversial claim by Goody was that (Western) literate traditions were causal forces in the creation of modern, democratic forms of government; this was echoed in Olson’s early general statements about literacy and modern science. Their claims were effectively criticized, but as an ideological assumption, as separate from what we might call historical understanding, the equation of literacy with modernity in the West is widespread and pervasive (see Street, 1984; Collins and Blot, 2003: Chaps. 2 and 4, for critical discussions).

The pertinent question, of course, is what is meant by ‘literacy’ or ‘modernity.’ Some recent linguistic anthropological work provides a nuanced approach to the issues. In *Voices of modernity: language ideologies and the politics of inequality*, Bauman and Briggs (2003) discuss the way in which major philosophical works, developing a conception of modern versus traditional society, depended on a highly selective viewing of language. A case in point is provided by John Locke’s essays on the foundations of knowledge and forms of government. In both kinds of essay, Locke treats language as a purely literal-referential communicative device, stripped of its interactional or contextual dimensions. (His view of language is thus like overly generalized conceptions of literacy, common enough in the 20th century, which equate an undifferentiated literacy with a singular modernity.) As Bauman and Briggs show, there are many intellectual traditions, ranging from Classical Empiricism through Antiquarianism, Folklore, and Boasian Anthropology, which have differently stipulated what is essential to ‘language,’ while giving priority to specific **entextualizations** of language, as part of their projects of establishing boundaries between the modern and the pre-modern.

Reporting from a very different part of the world, and treating a more modest historical scope, Schieffelin (2000) also grapples with the issue of literacy and modernity. In her article she analyzes how the Kaluli of highlands Papua New Guinea have responded to Christian missionary activity and the

variety of literacy practices attendant upon such activity. Analyzing missionary grammars (structural linguistic descriptions) and literacy primers, she shows how descriptive and prescriptive documents systematically skew the form of Kaluli language like importing Anglophone notions of literacy and encouraging reading and writing activities of a church-appropriate type. Kaluli literates, for their part, bring a local slant to interaction and interpretation. They read in groups, rather than in isolation, and they interpret written language as speech, in accordance with Kaluli beliefs about what is primary: talk rather than text. These local appropriations notwithstanding, Kaluli of the 1980s, after some 50 years of missionary activity, have adopted a modern ideology of authoritative truth: it resides **in the written text**. The blending of imported categories of description and practice with indigenous ones is part of a local modernity that Schieffelin deftly characterizes. But the Kaluli are nonetheless drawn into what she calls “colonial and missionary intrusions . . . premised on the principle of asymmetry: domination, control, and conversion . . .” (Schieffelin, 2000: 321).

One general lesson from this work is that in thinking about literacy ideologies and long-term developments, such as the emergence of modernity, it is wise to seek out variation in and dialogic exchanges between the so-called modern and non-modern. It is also important to be aware of the frequent connection between literacy practices and forms of power and authority, to which we now give our attention.

Institutions, Language, and Social Structure

Investigating ideologies of literacy and of language more generally can help in understanding literacy practices as doubly-articulated phenomena, that is, as enacted in events while also informed by ideological overlays. Efforts to understand the relation between empirical events and abstract entities such as models must, however, also attend to literacy institutions and their authority with respect to language, language use, and social differentiation. Religion and education are two well-known examples of such institutions.

As Goody (1986) and numerous others have noted, the spread of ancient civilizations, with their city states, extensive taxation, and conscript armies, typically also featured priestly castes and temple complexes, which were distinguished by their knowledge and control of an esoteric literacy dividing elites from masses. World religions are also famously “religions of the Book” and struggles to control the book – its script, language, or interpretation – are struggles through which knowledge becomes power and power knowledge.

Even in relatively modern times, the elite concern to regulate mass forms of literacy is evident. One of the first known national literacy campaigns, in 17th century Sweden, also featured national literacy tests. A country with high literacy rates and surprising gender equality in those rates, Sweden’s literacy campaign featured household instruction and religious oversight: parish supervision and compulsory testing to ensure not just reading but orthodox, Protestant reading (Gee, 1996: 32–34). Besnier’s close analysis of Nukulaelae church services brings out the way in which religious **institutions are enacted**, how categories of person, and knowledge, and text are combined in communicative events: e.g., the sermon. In such events, differences between the kinds of person are presumed, displayed, and thus reproduced: for example, between the Christian and un-Christian; and between men who write and women who read. A limiting case of sorts is suggested by dissenting, hybrid religious movements. The examples of Silas John and Oshitelu show that a prophet, his writing, and chosen readers, can mobilize charismatic authority, in claiming and performing divine access through scriptal practices, without substantive institutionalization of offices, personnel, or resources. An important point revealed in all these cases, as in those discussed by Schieffelin (2000) and Wogan (2004), is that something significant occurs with the locating of authority, truth and correctness **in text**. Epistemologies and ontologies shift as well as what we might call social technologies of language. Artifactualized language is subject to different dynamics of accumulation and distribution than non-artifactualized language, with different potentials for ideological articulation and institutional consolidation.

Ever since Socrates’s voice was transmuted into Plato’s writings, the school as well has been a paradigmatic literacy institution. Since the time of the Greek and Roman empires, the *schola* has been the primary site for drawing boundaries between the idealized uniformity and consistency of civilized language and the hybridizing variety of barbarian tongues. It is a familiar story that nationalism feeds upon and promulgates the standardizing of language, a political impulse toward centralization and control given great efficacy by the institutions and agents of the nation-state and the colonial regime, accompanied, to be sure, by local interpretations and reworkings (see Gee, 1996; and Street, 1984 and 1993, for discussion of general mechanisms and cases from national, colonial, and postcolonial settings). There is considerable historical and ethnographic work showing that schooled literacy is a particular institutional regulation of appropriate practices of reading and writing in correct forms of language, a mode of contemporary power which is also inextricably

connected to dynamics of subjectivity and identity formation (see Collins and Blot, 2003, Chaps. 4 and 5, for discussion and extensive bibliography).

That schooled literacy in the United States, for example, reflects and helps reproduce patterns of race and class inequality is both a familiar claim and the proverbial tough nut to crack. The undeniable persistence of racialized class inequality in literacy attainment has fueled an ongoing sense of a literacy crisis in late 20th and early 21st century America, yet neither side in the acrimonious reading wars of the last decade have much compelling evidence that their pedagogical proposals to improve school literacy achievement will do that, let alone lessen general economic inequalities. The current plight is well characterized in Rogers' (2003) ethnographic and critical discursive analysis of the panacea of family literacy, which focuses on one African-American family's multigenerational struggles with schools, Special Education referrals, and the damaged identities that result from literacy failure. Rogers, an ardent believer in the value of literacy and education, nonetheless writes:

... research in New Literacy Studies has demonstrated that parents of working-class and minority children do value education and school and are involved with their children's education. I want to suggest that it is **precisely because of this belief and involvement that working-class and minority families' efforts are thwarted within the institution** (Rogers, 2003: 144, emphasis added).

One way of thinking about valuing education and encountering failure in school and the workplace, a way of moving beyond the current political opportunism of reading reform, is suggested by Brandt's (2001) historical analysis of literacy traditions and practices in 20th-century America. Drawing on Bourdieu's writings about social fields and her own historical material, Brandt argues for the concept of bold sponsors of literacy, providing more dynamic accounts of social institutions – of family, church, school, and the workplace – and their intertwined role in promoting and regulating literacy practices.

Taking Stock: New Literacy Studies, Linguistic Anthropology and Indexical Analysis

In the preceding I have discussed the New Literacy Studies' formulation of literacy practices and some of the empirical work developing this conception. Interwoven with and as complement to that discussion, I have drawn on research on the history and anthropology of literacy, seeing this especially as part of a general sociocultural perspective on literacy practices. I have emphasized the artifactualization of

language, uses of artifactualized language, especially in the domain of religion and the occult, the ideological articulations of such uses, and the significance of literacy institutions and their authority in order to discuss analytic and substantive issues relevant for understanding literacy practices understood as sociocultural phenomena. These are issues which are mentioned in various NLS works; indeed it is a truism of NLS work that literacy is ideological, but on my reading these issues are not given sufficient theoretical attention or empirical priority **in their inter-relation**.

One way of approaching this argument is to note, again, that most work on literacy practices posits a two-way relation: between events and models. Within linguistic anthropology, the subfield of anthropology that takes language analysis as central to a more general project of sociocultural inquiry, much work on language function and ideology has either been explicitly cast as practice (e.g., Hanks, 1996) or has developed via theory and analysis of indexicals (e.g., Ochs, 1996; Silverstein, 1985). On my reading, this work shares a fundamental assumption: that overcoming the dichotomy of the linguistic/social requires analysis of a three-way relation: between language **form** (system), language **use** (acts, events), and language **evaluation** (an ideological or reflexive aspect of social process and communicative conduct).

There is now a small but growing body of work which uses analysis of indexicality to investigate the sociocultural processes in which literacy practices are situated and to which they contribute. I have discussed this briefly above, with regard to Bialostok's work on models of reading and Shuman's discussion of talk-text interactions among working-class adolescents. Two general points may be made regarding this work and indexicality more generally. First, analysis of indexicals entails a commitment to systematic investigation of language-context relations, with healthy concern for interpretive complexities. Second, it requires as well an awareness that many language-context indexical relations are indirectly related to – they **indirectly index** – other sociocultural constructs and processes, which are themselves essential to the larger analysis. Briefly put, I think that indexical analysis offers a promising entrée to the interplay between microanalytic language use (events) and macroanalytic sociocultural constructs (including models). Let me turn to some examples. Silverstein (1996) is an influential discussion of the indexical underpinnings of language standardization in the contemporary USA, linking such standardization to general semiotic-economic processes, such as commodification, and ideologizing strategies, such as naturalization. More recent explorations of indexical dimensions of literacy and learning include

attention to long-term interactional development of student identities; the indexing of unspoken models of appropriate literacy; the interplay of heterogeneous voices, pedagogical innovation, and globalized discourses of learning; and the assembly of knowledge and identity in dispersed, digitally mediated work settings (see studies in Wortham and Rymes, 2002). Blommaert (2005) provides a series of illustrative cases and analyses of literacy practices within orders of indexicality – authoritative frames for reading and writing events – which organize postcolonial and diasporic encounters between Africans and Europeans. Collins and Slembrouck (2004) develop a related line of inquiry via a case study of the reading practices encountered in situations of dense, migration-based multilingualism.

Conclusion

I have concluded with a brief discussion of work using indexical analysis to investigate literacy practices because it shares with research in the NLS framework a concern to grasp the simultaneous, ongoing interplay between the microphenomena of everyday life and the macrophenomena of institutional orders, unequal resources, and accumulated power and authority. But the work on indexicality holds more closely to what I take to be an important insight from linguistic anthropology: that understanding communicative practices, in our case, literacy practices seen as total social facts, requires attention to language form, use, and evaluation. Such a three-way analytic can lead from situated communicative doings to longer-term structuring processes, while remaining attentive to cultural dynamics. I think the foregoing discussion of religion, magic and literacy practices illustrates some of the issues involved.

It must be borne in mind, however, that concern with literacy practices is not just an effort to better understand literacy, though it is that. The concept emerged along with the New Literacy Studies, which were themselves an effort to consolidate a critique against earlier models of literacy, in the academy and officialdom more generally, which privileged Western literate traditions and minds over other traditions and minds. In their concern to uncover and demonstrate the logics underlying mundane practices by the economically, politically, and culturally disfavored, NLS practitioners share with anthropologists a number of philosophical, analytical, and substantive concerns, and they share also, I would suggest, an ethical commitment to anthropology as cultural critique. In the urgency of their normative stance, they may focus overly much on legacy of the school in shaping literacy practices (an indictment in which

I would place myself in earlier textual manifestations), and in widening this focus, sociocultural perspectives are invaluable. But in their normative stance, NLS practitioners also remind academic anthropology that knowledge matters – in struggles as well as deliberations. Let this article be a contribution to and encouragement of continuing exchanges, on the common ground of literacy practices, between critical anthropology and new literacy studies.

Literary Pragmatics

J L Mey, University of Southern Denmark,
Odense, Denmark

© 2006 Elsevier Ltd. All rights reserved.

The efforts to relate the study of literary texts to the science of language have mainly taken two directions. In an earlier, quantitative approach, the emphasis was on how to characterize a text, based on the occurrence of certain elements (substantives, adjectives, and so on). The methods employed were mainly statistic. Later approaches focused on the qualitative aspect: how to account for certain characteristics (grammatical constructions, literary tropes, etc.) thought to be specific for types of text or, more generally, how to characterize a stretch of text in relation to what used to be called 'extralinguistic' purposes: persuading, arguing, questioning, etc. – matters that used to be taken care of in the discipline called rhetoric.

When talking about literary pragmatics, it is important to realize that pragmatics was not developed from inside linguistics but, rather, originated in related fields, such as philosophy, sociology, and the theory of interaction. The linguists were initially alerted to pragmatics through the aporias that arose within their strictly limited field of view (see **Pragmatics: Overview**). Similarly, literary studies did not 'discover' pragmatics by themselves; the approaches to

the study of texts as related to the human users were developed simultaneously by philosophers, literary theoreticians, and pragmaticists. The purpose of these endeavors was to make sense of the fact that language does not always obey the strictures of the grammarians; indeed, the linguistic structure of a text has, in many cases, very little to do with the effects of a text, with what it 'does,' or with how a text is produced and consumed by the users.

Applying the definition of pragmatics as "the study of the use of language in human communication, as determined by the conditions of society" (Mey, 2001: 6) to the case of literary communication, we may say that literary pragmatics is concerned with the user's role in the societal production and consumption of texts.

The Linguistics of Texts

Early approaches to literary pragmatics (what used to be called 'text linguistics') took their point of departure in certain concepts that had been developed in linguistics mainly in order to cope with the needs of grammatical description. A text was thought of as a hierarchically structured complex of sentences, just as the sentence itself was considered a hierarchically structured unit of 'phrases' (noun phrases, verb phrases, etc.). A 'text grammar' was proposed in

parallel to the sentential grammar developed by Chomsky and his school (see, e.g., van Dijk, 1972).

Later efforts were spurred on by the achievements of philosophers and pragmaticists such as Austin and Searle, who developed a theory of 'speech acts' – that is, utterances that did something in addition to being merely 'uttered': the 'illocutionary' vs. the simple 'locutionary' aspect (see **Speech Acts**).

The idea that utterances had a 'performative' and not just a 'constative' value (originally due to Austin, 1962) gave rise to a classification of speech acts into categories such as assertions, questions, orders, and apologies. Following on this, some suggested that we could look at a text as a gigantic 'macro-speech act' that had under it all sorts of individual acts, each expressed in some hierarchically ordered, linguistically recognizable form. This approach mostly failed, on several counts. First, it was not easy to explain what exactly the relationships were between the different acts making up the text. There was also the problem of the hierarchical constraints, which seemed unnatural, given the essentially linear, and often unpredictable, nature of textual 'speech acting.' However, the idea that sentences may be conjoined in deeper ways than just being strung together on the surface ('concatenated' in Chomskyan parlance) had taken hold. Similarly, the notion that language 'performed,' did something, led to the valuable discovery that certain sentences were 'doable' or 'speakable,' and others were not (Banfield, 1982).

Perhaps the most important insight into the nature of human language use as 'doing things with words' (Austin, 1962) was due, again, not to a linguist but to a philosopher, H. Paul Grice, who took the ideas developed by both Austin and Searle (1969) several steps further. In order to explain the regularity of human conversations and their mostly successful outcomes, Grice (1989: 26–31) postulated the principle of cooperation, stipulating that every person's contribution to a conversation should be commensurate to its purpose (including the aims and motives of the participants) (see **Cooperative Principle** and **Grice, Herbert Paul**). Grice further suggested four conversational maxims regulating our cooperative handling of conversational information: making it sufficient (the maxim of 'quantity'), true ('quality'), relevant ('relation'), and orderly ('manner'). Any infringement of these maxims should be interpreted (assuming the general idea of conversation as cooperation) as implying an additional meaning: Breaking ('flouting') a maxim imparts a message that although not explicitly mentioned, nevertheless is understood. Grice's famous example is that of a professor writing a recommendation for a student, consisting of a statement as to the student's attendance in class and his correct

English spelling – clearly irrelevant matters in the context – and thus implying that there must be a reason for the professor's unwillingness to cooperate, viz. that the student does not deserve a 'real' recommendation (Grice, 1989: 30) (see **Maxims and Flouting**).

Grice's notion of 'implicature,' as it is called, is of the utmost importance with regard to explaining how authors and readers go about 'cocreating' the literary work, as discussed later (see **Implicature**). It has often been remarked that the essence of art, visual or literary, is in the way we omit things, rather than saying them outright or representing them pictorially. When a queen utters that she is not amused, we understand perfectly well what she is, and we hide to escape her wrath. When God asks Cain, 'Where is Abel thy brother?' Cain realizes (since God of course knows exactly where Abel is and who killed him) that this implies the question, 'Why did you do this to your brother?' However, Cain refuses to cooperate in this conversation and tries to deny the implicature that he should have been 'his brother's keeper.' But in the next sentence, having 'answered' God's question with the pseudo-cooperative utterance 'I know not,' he shows that he indeed has gotten the implied message: 'Am I my brother's keeper?' (Gen. 4:9).

In the following sections, I briefly indicate the particular instances in which pragmatics meets with various linguistic and literary approaches, as they are dealt with in the remainder of this article.

The problems of text production and consumption are discussed first. Next, a brief discussion is provided of a concept that has gained increasing attention in the discussions during the past few decades: interactivity, understood as the active (specifically Gricean) collaboration between reader and author. Such a collaboration involves more than plain interaction, however: the relationship between the active partners is 'dialectic,' which means that neither the author nor the reader can claim exclusive possession of, or authority over, the text. Following this, I characterize this relationship as a 'cocreative' one: a text is not the exclusive work of the individual author but always presupposes the active collaboration of an audience, the readers. How this cocreation is orchestrated technically is the subject of the following sections, in which first some classical linguistic techniques of 'signposting' are discussed, and then the important pragmatic concept of 'voice' is introduced as that which brings the text to life. In particular, the 'point of view' embodied in the voice of a character helps us find our way through the textual maze; this 'vocalization' relies not only on signposting by means of linguistic devices but also on the techniques of cooperation and implicature (including flouting) that were

mentioned previously. When the proper conditions for use of these techniques are not met, we may experience a phenomenon that I have termed ‘voice clashing’: voices speaking out of order, either by an author’s fiat or (more often) by authorial negligence. The final section wraps up the discussion by stressing the human engagement that is the necessary condition for successful text work.

Production and Consumption

The following is a common model of production and consumption in our society: a producer delivers a product to the market, and the consumer pays the market price, acquires the product, and starts consuming it. After the transaction is concluded, producer and consumer part ways, never to meet again unless in special cases (foreseen by the laws regulating trade in our society), such as inferior product quality or unsatisfactory handling of the financial aspects of the purchase. This relationship is purely linear and unidirectional; the deal, once consummated, cannot be reversed (barring special cases such as return or repossession of the product).

One may be tempted to apply this simple model to the production and consumption of literary works: The author is the producer of some literary text, whereas the reader is a consumer who happens to be ‘in the market’ for a particular literary product. Once the book is bought, the reader is free to do whatever he or she wants to do with it: take it home and place it on the shelf in the living room, possibly read it, or maybe even throw it in the trash – or at somebody, literally or metaphorically.

In reality, things happen not quite like that. Buying a book is not like acquiring a piece of kitchenware or furniture. One does not just bring a book back from the bookstore: one takes home an author, inviting him or her into the privacy of one’s quarters. The author, on the other hand, does not just make a living, producing reams of printed paper (granted, there are those that do), but has a message for the reader as a person. This is, eventually, why books are bought and sold: not because they are indispensable for our material existence, but because they represent a personal communication from an author to a potential readership – a communication that, in order to be successful, will have to follow certain rules.

Authors and Readers

The process of writing has been likened to a technique of seduction: a writer takes the readers by their hands, separates them from the drudgery of everyday life, and introduces them to a new world, of which the writer is the creator and main ‘authority’ (Mey, 1994:

162, 2000: 109). The readers will have to accept this seductive move and follow the author into the labyrinth of the latter’s choice in order to participate properly in the literary exercise. The readers take the narrative relay out of the hands of the author: ‘The author is dead, long live the reader,’ to vary Barthes (1977).

Marie-Laure Ryan (2001) envisioned this reader participation along a twofold dimension: that of interactivity (in which the reader manipulates the text) and that of immersion (where the reader seamlessly identifies him- or herself with the text). In immersion mode, the reader is not just a spectator on the virtual scene: The ‘role of the reader’ is that of an “active participant in the process of creating the fictional space” (Mey, 1994: 155). As discussed later, the immersed reader is a ‘voice’ in the text; he or she is not only ‘present at the creation’ of the text but also to some extent its ‘creator’ (Barthes, 1977).

In literary texts in particular, the success of the story depends not only on the author but also to a high degree on the reader. In the process of creating the text, the reader is created anew, reborn in the text’s image. This interactivity does not just happen on the level of the text: it involves a deeper layer, that of the self. What is created is not only the fictional space but also the reader in it, ‘lector in fabula.’ ‘This book changed my life’ is therefore not just a trite expression we employ to register an exceptional reading experience; such changes happen whenever we consume texts (including nonliterary genres, such as scientific and commercial prose, legal texts, etc., and ‘texts’ in a wider understanding of the term – theatrical and movie productions, the visual arts, and so on; Mey, 1994: 155). Updating our view on texts, we may even include here the virtual realities of the computerized world and its texts, as discussed by authors such as Gorayska and Mey (1996), Ryan (2001), and others.

Text Dialectics

A dialectic situation of interaction occurs when the interacting parties influence each other in such a way that the outcome of what one party does is determining for the other’s ability to operate.

In language use, the pragmatics of interaction determines the game, whose very name is dialectics. When speaking or writing, we are always engaged in some communication (informing our partner about some event, apologizing for inflicted injuries or insults, promising services, telling a story, etc.). In this activity, we crucially depend on the other’s presence and cooperation not only for the legitimacy of our speech acts but also for their very viability. Conversely, our interactors depend crucially on who we think they are

and on whether they think of us as good partners in interaction. (After all, one can only tell a story properly to listeners whose interests one shares or imagines one does). The way we see ourselves and our partners, and how they see themselves and us, is essential to this dialectic process. The following section details how such representations come about and are managed.

Cocreativity

Pragmatically speaking, a text is the result of what Bakhtin (1994: 107) called “the meeting of two subjects.” The life of the text “always develops *on the boundary between two consciousnesses, two subjects*” (Bakhtin, 1994: 106; italics in original) the two consciousnesses being the author’s and the reader’s. The author is by definition conscious of his or her role in creating the world of letters, the ‘fictional space,’ mentioned previously. However, the reader’s consciousness is just as essential in cocreating this fictional universe. For Bakhtin, the reader is the (co-)creator of the text: It is in the dialogue between author and reader that the text, as a dialectic creation, emerges (see Bakhtin, Mikhail Mikhailovich).

How do author and reader, these two ‘consciousnesses,’ navigate the fictional space? For a reader, it is not enough to identify with the author passively; the reader must consciously adopt the cocreator role, as it is assigned by the textual dialectics. Conversely, the author must consciously alert the reader to the signposts and other ‘indexes’ placed in the fictional space to enable the navigation process.

In some older novels, mainly those written in the 18th and 19th centuries, the author often appears on the scene in person, apostrophizing the reader and telling him or her what to do, what to feel, what not to object to, which ‘disbeliefs to willfully suspend,’ and so on. The 19th-century British writer Anthony Trollope was a master of this ‘persuasion-cum-connivance,’ as when he told the readership that he was unable to expatiate more on certain characters of his story: the publisher, a Mr Longman, would not allow him a fourth volume, so he had to finish the third and last of the Barchester novels at page 477 – and, well, since we are already at page 396 . . . (“Oh, that Mr Longman would allow me a fourth!” Trollope, 1857/1994: 306). The curious and eagerly co-creative reader hurries to the last page of the novel to find that its number is indeed ‘477,’ just as the author had predicted. We cannot exclude the possibility that the reader may feel a bit taken in: the cocreative is morphing into the gullible.

Cases such as these are the exception, and readers will normally do no more than smile at discovering their complicity in what is commonly understood as an authorial prank. In other cases, the cocreativity

that is needed to make the cocreative enterprise succeed, although less obvious, is (perhaps for that reason) considerably more effective. Notorious instances of successful ‘reader deception’ are found in the Argentine writer Julio Cortázar’s work, as in the novella ‘Historia con migalas’ (‘A story of spiders’; 1985). Here, the author consciously leads the reader down a ‘garden path’ of narration, along which the two female protagonists by default are assumed to be a male–female couple. Only in the story’s very last sentence do they literally remove their morphological protection, along with their seductive veils (see Mey, 1992; the trick is pulled off successfully only in the Spanish original).

In the Cortázar story, reader seduction (involving the cocreation of a manipulated consciousness) is achieved without the reader’s awareness – a typical requirement of certain literary genres, such as the joke or, as in this case, the garden path story. In other (more normal?) cases, readers are guided through the fictional labyrinth by certain indications as to where the narrative ‘thread’ is leading them, which readerly pitfalls they have to avoid, where to proceed with caution or alternatively with boldness, and so on.

Signposting

In the Cortázar story, the reader is led astray by the (mis)use of linguistic means. It is as if the author had changed or removed the usual road signs – a technique one could call ‘deceptive signposting.’ The question is what are these signposting techniques, and how are they normally used to bring coherence to a text when no garden paths or jokes are involved?

First, we have the time-honored concepts of ‘deixis,’ such as when articles and (personal) pronouns are employed to ‘point to’ a particular character. In particular, in anaphora, the relative pronoun is used to ‘point back’ (or, in cataphora, ‘forward’) to a character or object that is already mentioned, or is going to be mentioned, in the story. The common concept covering these phenomena is called ‘(phoric) reference’ (see **Deixis and Anaphora: Pragmatic Approaches**).

In addition, we have means to indicate the time and place relations that are of importance in order to establish and promote the flow of the story. Time adverbs such as ‘today’ and place adverbs such as ‘abroad’ tell us when, and where, the story is taking place. Also, we have sentence adverbs that give a particular flavor to a larger stretch of discourse, sometimes even an entire paragraph (e.g., ‘regularly,’ ‘unfortunately,’ and ‘clearly,’ especially when placed sentence-initially).

As was the case in the Cortázar story, much of the correct understanding of a story is imparted through the use of gender-marked items, such as ‘she’ vs. ‘he,’

or by exploiting the difference between a male and a female form of, for example, an adjective. The latter technique is not always applicable in English; in the Cortázar case, the 'dénouement' comes when the unsuspecting reader finally is confronted with an unequivocal, female adjectival form: *desnudas* 'naked' (a Spanish fem. plur. since it refers to women; in the English translation, this point gets lost and the garden path leads nowhere).

In addition to these linguistic techniques, pragmatics offers the reader a great help. There is Gricean implicature, mentioned previously; furthermore, the author has at his or her disposal various ways of representing speech or thought, either by directly quoting a character's utterance (literally putting words in his or her mouth) or by indirectly reproducing what the character is thinking to him- or herself in 'free indirect discourse,' as in the following quote from Jane Austen (1810/1947: 191): "And now – what had she done or what had she omitted to do, to merit such a change?" Here, 'she' (Catherine, the novel's heroine) is musing about her sudden change in fate (owing to the fact that, unbeknownst to her, the father of her lover has discovered that she is no rich prospect after all); however, we are never told explicitly who this 'she' is: being competent, cocreative readers, we will know.

Characters are given 'voices' that we clearly and distinctly perceive as the characters' and theirs alone. This notion (including the phenomenon of vocalization) is discussed next.

The Voices of the Text

Vocalization

'Vocalization' is a powerful way of creating and maintaining the fictional space with the willing help and indispensable assistance from the readership, and of 'orchestrating' the dialectics of cocreativity between author and reader. Taken by itself, the term may be translated as 'giving a voice,' 'making vocal' (or 'heard,' depending on the perspective). In the context of literary pragmatics, vocalization means 'giving a voice to a character in the story' – in other words, making the character speak.

We are more or less familiar with the phenomenon from the simple fact of narrative dialogue. Whenever a conversation is included in the story, we hear the voices of the characters discussing current events or other matters of interest, such as how many kinds of love there are (compare Kitty and Anna's conversation in Tolstoy's *Anna Karenina*; 1889/1962: 155), or the advantages of married life as opposed to the single gentleman officer's existence, as enthusiastically described by General

Serpuchovskoy to Vronsky – how he got his hands freed when marriage lifted the 'fardeau' of everyday worries onto his shoulders (Tolstoy, 1889/1962: 350). In situations such as these, the attribution of voices is done in a straightforward manner, more or less as it happens in a play: the lines are put into the mouths of the characters, given voice through the unique assignment of a familiar role name, and are often preceded by what is called a 'parenthetical,' such as 'he said,' 'she laughed,' and 'he cried'.

Voice and Focus

Vocalization is an intricate process, inasmuch as it not only gives voice to a character in the strict sense of speaking one's part, but also affords information about the character's perspective or point of view. What the voice indicates is not just the character as such (by naming the person) but also the viewpoint from which the character sees the other characters, and indeed the world. In this wider sense, voices range over the entire fictional space they create: "Utterances belong to their speakers (or writers) only in the least interesting, purely physiological sense; but as successful communication, they always belong to (at least) two people, the speaker and his or her listener" (Morson and Emerson, 1990: 129).

Vocalization always implies 'focalization,' a focusing on the characters' placement in the literary universe (Mey, 2000: 148). In Bal's (1985: 100) words, focalization is "the relation between the elements presented and the vision through which they are presented." This vision and these relations are not open to direct inspection by the reader's naked eye in as much as they are necessarily mediated through the voice of the author; consequently, they may have trouble being focalized properly.

The Pragmatics of Voice

In the absence of obvious signposts, such as names and parentheticals attached to the 'physiological utterance' (especially when we are dealing with an unspoken thought or an 'unspeakable sentence'), we may be unsure whose voice we are hearing. This is where pragmatics comes to the rescue.

In order to be speakable, a sentence, Banfield (1982) noted, must have a 'speaking subject' – not just a sentential subject, but one authoring the utterance that is placed in a context in which certain utterances are speakable by certain persons. Successful vocalization at the author end is matched by the reader's successful revocalizing: the reader cocreates the part of the fictional universe in which the utterance is spoken and attributes the voices univocally to the focalizing characters, including the speaking subject.

When Voices Clash

Voices may sound in harmony, or they may clash. A voice that is not in accordance with what we, as readers, know about the speaking character will jar, not sound right; we do not feel it is the voice of the character (but perhaps the voice of the intrusive narrator trying to disguise him- or herself as a character or even, as in the case of Trollope, as the author). Other clashes are often referred to as 'poetic license,' such as when animals are attributed vocalizations that are not in keeping with their animal status. In *Anna Karenina*, we encounter quoted thoughts ascribed to the bird-dog Laska, who is irritated at Levin and his brother because they keep chatting while the birds fly by, one after the other, without the hunters so much as bothering to point their guns at them: "Look how they have time to make conversation – she thought – And the birds are coming In fact, here comes one. They're going to bungle it . . ." Laska thought' (Tolstoy 1889/1962: 185).

In other cases, the reader is confused, such as when voices speak 'out of order,' having access to material that is strictly not accessible to the characters, given their background, or even false (Mey, 2000: Chap. 6). Such 'clashes' may even be caused intentionally, for example, in order to obtain a comic effect by letting characters adopt modes of speech that are not commensurate with the speech proper to the events or characters (such as when a director purposefully introduces modern colloquialisms and slang into a Shakespearean play).

Conclusion: The Role of Pragmatics

The user has been the guideline in our reflections on the ways readers and authors participate in the common endeavor of creating a literary text. The dialogue we engage in as authors and readers is a dialogue of users; the 'dialectics of dialogue' has been invoked to explain the users' cocreative roles, as authors and readers, in establishing the textual object (e.g., a story).

However, dialogue does not happen in a vacuum; it is

a dialogue of social forces perceived not only in their static coexistence, but also as a dialogue of different times, epochs and days, a dialogue that is forever dying, living, being born: Coexistence and becoming are fused into an indissoluble, concrete *multi-speeched* [italics added] unity. (Bakhtin, 1992: 365)

The voices of the text are anchored in the plurality of discourse, in a 'multispeeched' mode; this multivocality represents the dialectic relations between different societal forces (see **Discourse, Foucauldian**

Approach). If it is true that texts only come into existence as human texts through an actual engagement by a human user (as already stated by Roman Ingarden in 1931), then a pragmatic view of text, particularly literary text, is anchored in this user engagement. Conversely, the user is engaged only insofar as he or she is able to follow, and recreate, the text supplied by the author. Among the voices of the text, the reader, too, has one; this vocalization is subject to the same societal conditions that surround the author. The textual dialogue thus presupposes a wider context than that provided by the actual text. As we have seen, pragmatics offers a view on this wider, social context and explains how it interacts with author, texts, and readers.

Literary Theory and Stylistics

K Green, Sheffield Hallam University, Sheffield, UK

© 2006 Elsevier Ltd. All rights reserved.

Stylistics and literary theory would appear to coincide neatly in a concern for the language of the given object, literature. In one model, stylistics can be seen as a hyponym to the superordinate theory of literature, that aspect of theory that explicitly deals with locating and describing the particular language of literature. Yet stylistics is often marginalized as a literary-critical approach and has not enjoyed an easy relationship with many of the dominant trends in literary theory. Indeed, the term *stylistics* has suggested to some critics a rather marginal activity having to do with the niceties of an author's style; but it clearly is much more than that. In a broad historical context, stylistics has its roots in the *elocutio* of Aristotelian rhetorical studies. Crucially surviving from the rhetorical tradition, *elocutio* dealt with the appropriateness of the expression and the relevance of its stylistic choices. Thus, it is a focus on the language of the expression in a particular way to do with *how* the text means, rather than *what* it means. Here are the roots not only of stylistics, but also of formalist and structuralist analyses of the 20th century. Literary theory, in contrast, is a broad area of investigation covering linguistic, social, cultural, political, economic, hermeneutic, empirical, and psychological issues surrounding the production and consumption of literary texts.

Before the 20th century, the notion of style was a secondary product of the analysis of grammar and rhetoric. In the 20th century, it developed from *elocutio* to encompass almost anything to do with an explicit focus on the 'language' of the (normally literary) text; that is, its particular and manifest phonological, lexical, and grammatical features. Stylistics arose partly because of the need in literary criticism to work with a set of agreed-upon and defined terms

for the analysis and description of a particular kind of language, the language of literature. Such a language would not be wholly derived from the study of rhetoric (though it would take from it where it felt it was necessary) but would be built upon modern linguistic analysis. Stylistics in the main has concentrated on literary texts (despite the offshoot and somewhat tautologous sounding 'literary stylistics'), although the concept of style extends beyond the literary. With its focus on the language of the text, largely (but not exclusively) treated in a synchronic manner, stylistics has obvious affinities with a certain kind of literary criticism, particularly what came to be known as 'practical' criticism. This critical approach, growing out of the work of I. A. Richards in the 1920s, focused on the mechanics of the text, its immanent language features, and gave the pedagogy of English literature an enormous boost by freeing it from the contextual constraints of history and biography and treating the text on its own terms. It was thus an important precursor of Anglo-American New Criticism. The text's 'terms' were linguistic, both in detail and in use as metaphor. Stylistics is not to be confused with the New Criticism of the 1950s and 1960s, but it does share some methodological axioms, and the two approaches overlap in the 1960s.

Modern stylistic analysis really began with the work of Charles Bally (1909) and Leo Spitzer (1948) in the first half of the 20th century. Bally's *stylistique* saw literary texts as examples of particular language use, and his work prefigures later conceptions of register and mode (particularly in the work of M. A. K. Halliday and David Crystal). Bally was a pupil of Ferdinand de Saussure. Spitzer, however, saw 'style' as not so much a particular form of linguistic 'character' but as a manifestation of social or historical 'expression.' Spitzer's work is essentially the cultural interpretation of style, and he suggests another important line of stylistic investigation (be it literary or non-literary). His work highlights an ongoing tension in

stylistics between formal description of linguistic features and broader cultural, psychological, or historical or interpretative aspects of the text.

Put simply, the goal of stylistics is to describe the linguistic features of the object of analysis in such a way as to demonstrate their “functional significance for the interpretation of the text” (Wales, 2001: 438). Its relationship to literary theory is a complex one. In the 1960s, linguistics became the focus both of a certain movement in literary theory and of critical approaches that grew out of the close-reading methods of I. A. Richards and others. The way in which linguistics was used by literary theory and stylistics, however, was radically different. Stylistics in its anglicized form has tended to eschew the philosophical complexities and self-reflexive obsessions of literary theory and to use the practical methods of linguistics wherever it sees them as being relevant to a particular reading. Linguistic theory and practice is very much the handmaiden of stylistics, which eclectically draws on what are deemed appropriate terminology and discourse. The dominant linguistic theory throughout the 1960s and 1970s was undoubtedly that of Noam Chomsky and his followers, yet strikingly, stylistics almost ignored his work during this time. The Chomskyan influence is seen particularly acutely in the work of Ohmann (1964) and Levin (1962). Here, style is seen as a transformational option selected from a core form. Despite the central notion of ‘transformations,’ which could easily be related to notions of style (and is presented convincingly by Ohmann and Levin), Chomsky’s work was seen as too abstract for the text-driven concerns of the stylistician.

Stylistics found a more sympathetic grammar in the work of M. A. K. Halliday, whose systemic grammar allowed stylisticians to link grammatical description with literary effect in a way that was more transparent than in the Chomskyan paradigm. Halliday’s functional approach (Halliday called it *systemic-functional*) again uses the notion of language *choices*, but sees them determined by the uses or functions which they are seen to serve. Language is thus socially constituted and meaning cannot be formulated in isolation (in opposition to the formalist approach). Literary stylisticians approved of this view because it allowed the notion of literary ‘style’ to be part of a larger, sociolinguistic network. In the 1970s and 1980s, stylistics drew on a number of different methodologies and approaches, most notably the Hallidayan functional model, feminism, pragmatics, and discourse analysis, these approaches being dominant and extremely influential. Indeed the most obvious and striking development in stylistics in the last 20 years has been its recognition of the notion of ‘discourse’ – although this was not especially new

and had a precursor in Crystal and Davy (1969). There are some parallels in literary theory in that following the radical movements of structuralism and deconstruction in the 1960s and 1970s, a more historicist approach began to be seen. This was not simply an opposition to the formalisms of, for instance, deconstructive methodologies, for the New Historicism often incorporated deconstructive practice (particularly in the work of Stephen Greenblatt). Rather, it was a widening of the linguistic context and a breaking down of barriers between literary and nonliterary writing.

Perhaps the most pervasive influence on stylistic analysis in recent years, then, has been that of discourse analysis, and there are again parallels with developments in literary theory. Discourse analysis can signal many things, from the most text-centered description of language fragments to broad, Foucauldian speculations about power and language. Literary theory has drawn more on the work of Foucault than almost any other theorist of ‘discourse,’ and yet Anglo-American stylisticians remain suspicious of his writing and treat it with a degree of scepticism. What unites the Foucauldian approach with those such as the Hallidayan, however, is a belief in the contextual nature of language and a focus on language ‘beyond the sentence.’ Further, there is a belief, not always made manifest, that the (discourse) stylistician should be looking at ‘real’ language; that is ‘naturally occurring’ discourse. Of course, literature provides us with a ready-made supply of ‘real’ discourse, although many discourse analysts reject this corpus, insisting that it is ‘deviant’ language. However, the approach has been fruitful in the field of stylistics. Ronald Carter’s seminal collection of stylistics essays *Language and Literature* (1982) was followed by the volume *Language, Discourse and Literature: An Introductory Reader in Discourse Stylistics* (1989). The shift in focus is clearly registered in essay topics: the first volume is dominated by grammatical considerations, despite the inclusion of Deirdre Burton’s influential ‘Through glass darkly: through dark glasses’ (a politico-stylistic analysis of Sylvia Plath’s *The Bell Jar*). The latter volume draws heavily on developments in pragmatics and discourse analysis, including applications of Politeness Theory, Speech Act Theory, and Gricean pragmatics.

If we take discourse analysis in its broadest sense, then it is possible to also view stylistics, “as simply the variety of discourse analysis dealing with literary discourse” (Leech, 1983: 151). This may not lead anywhere, and rather sets stylistics adrift from other movements in linguistics. Stylisticians have tended to draw eclectically from developments in discourse

analysis (as they had done from other developments in linguistics) and the related field of pragmatics. Speech Act Theory, Politeness Theory, and Critical Discourse Analysis are now the staples of stylistic approaches. Speech Act Theory has also been adopted by literary theorists with some success, though Derrida's interpretation is quite different from Searle's. Fairclough's Critical Discourse Analysis (1989) has been extremely influential in encouraging a more politically orientated approach to stylistics. Used primarily in the analysis of media texts, it has proven fruitful in some aspects of literary analysis, reflecting the challenge (or threat) posed by the spread of media and cultural studies over traditional 'English' courses. Critical Discourse Analysis in a literary context is exemplified in the work of David Birch (1989), Sara Mills (1997) and Michael Toolan (1996), among others. It has its roots in Hallidayan systemic-functional linguistics (although Hodge and Kress 1993, successfully employ a Chomskyan model for analysis) and is particularly concerned with the linguistic encoding of ideology in texts. Its main object is most naturally the language of the media, of institutions, and of government; but again, stylisticians are able to examine the ideologies evident in representations of these elements as well as taking the broader view of literature as an encoder of ideology. The integrationalist approach of Michael Toolan is influenced by the work of Roy Harris (1984 and *passim*) and rejects many of the fundamental tenets of Western linguistics while promoting a holistic view of language function. Fundamentally exciting and iconoclastic, its effect has yet to be fully registered in literary discourse analysis.

Literary theory in the second half of the 20th century was initially driven not by Chomsky or Halliday or Richards or F. R. Leavis, or even Spitzer or W. K. Wimsatt, but by the Swiss linguist Ferdinand de Saussure, whose *Cours de Linguistique Generale* (1917) exercised a profound influence on continental and Anglo-American literary criticism (and indeed criticism of other arts). Translations and reprints of the work increased dramatically through the 1950s, 1960s, and 1970s, as the *Cours* became the *sine qua non* of literary criticism. But the way in which Saussure was adopted by literary critics and cultural theorists was vastly different from the way that, say, Halliday, was adopted by the stylisticians. Saussure offered no grammatical method and only the broadest semantic theory, and so was not adopted 'practically' in the same way. What he offered literary critics and theorists was a way of conceiving meaning relations, and he did so by positing a number of crucial, and by now extremely familiar, ideas:

- (i) The distinction between *la langue* and *la parole*
- (ii) The essential arbitrariness of the linguistic *sign*
- (iii) The arbitrary and conventional nature of the *sign*
- (iv) The distinction between the *signifier* and the *signified*
- (v) Language is binary and contrastive.

These five observations together revolutionized literary and cultural criticism and were thoroughly used and abused throughout the middle and latter part of the 20th century. Aberrant readings and deliberate misreadings of Saussure pushed literary theory into an extreme self-reflexive period in the 1970s. At first, Saussure's work was felt most keenly in literary structuralism, where content was bracketed off and structure became central. The literary text was seen to function like a sentence – a massive grammatical construction. Individual words (or signs) were mere fillers for essential structural functions and a sign's meaning was a result of its relation to other signs (in particular one in which it stood in binary relation to) and based on an arbitrary relation between the 'acoustic sound-image' (the signifier) and the concept associated with it (the signified). Thus, at a stroke issues of a text's 'meaning' were reduced to that of a text's structure. This fact coupled with misreadings of Saussure and extreme versions of the theory of the arbitrariness of the sign (*contra* Saussure), took criticism away from the delicate consideration of a text's aesthetic value and toward a consideration of literary practice as *sign*.

This is only one half of the story, however, for another version of structuralism took the notion of binary and contrastive relations and utilized it to produce close and immensely detailed analyses of the meaning relations in individual texts (Riffaterre, 1966). Indeed, Riffaterre's work, particularly the essay on Baudelaire's *Les Chats*, became a model for a certain kind of structural-linguistic analysis. In this important work, many of the present-day issues and difficulties to do with the location and description of style are evident. Riffaterre draws on the Russian formalist school in his notion of literature as some form of stylistic defamiliarization, but he attacks the structuralism of Roman Jakobson and Claude Lévi-Strauss for its indiscriminating location of features (which may or may not have stylistic significance). Riffaterre further is concerned with the effects of the language upon its audience.

In the early 1970s, debates about the relationship between linguistic analysis and 'traditional' literary criticism raged, particularly in the United Kingdom. The most famous of these was the Fowler-Bateson debate (1971) (see Simpson, 2004 for a reprint of this argument). Roger Fowler took it as axiomatic

that language analysis was at the heart of literary criticism, while F. W. Bateson, a literary critic, suggested that literature possessed an 'ineradicable subjective core' which was simply not amenable to linguistic analysis. Essentially, this was a claim for the unique status of literary language and a swipe at so-called 'objective' methods of analysis. But for a decade in the mid-1970s to the mid-1980s, the linguistic critics held sway, and the two approaches to linguistic theory and practice outlined above came together in a peculiarly anglicized form. The work of Fowler drew on both the continental Saussurean tradition and the more pragmatic (not in the linguistic sense) and eclectic stylistic Anglo-American tradition. In works such as *Linguistics and the Novel* (Fowler, 1977) and *Linguistic Criticism* (Fowler, 1986), one will find the work of Halliday, Chomsky, and Saussure linked with the practical consideration and analysis of a range of largely canonical literary texts. Traditional areas of investigation were given a new look, with some new terminology. In Fowler's work, we find analyses of 'mind style,' of paradigmatic and syntagmatic relations, and of free indirect discourse – standard areas for later stylistic analysis. Fowler's work drew on structuralist methodologies, if somewhat eclectically, but typically avoided Barthesian excesses.

In theory, stylistics offers common ground for those perennially separate groups of literature and language specialists; but the two domains have developed from such different origins that the relationship is never clear. In 1960, Roman Jakobson famously stated that "a linguist deaf to the poetic function of language and a literary scholar indifferent to linguistic problems and unconvertant with linguistic methods are equally flagrant anachronisms" (1960: 377). One could extend David Lodge's statement that "the novelist's medium is language: whatever he does, *qua* novelist, he does in and through language" (Lodge, 1966: ix) to literature as a whole. Literature is fundamentally language, and the linguist is interested in language. This language can be conceived of as fundamentally different from 'ordinary' language, or as different only to the extent that it contains a greater concentration of features already present in other forms of language. But whether the difference is seen as one of degree or one of kind, the object of analysis is still language. What could be simpler? Even with the arrival, or rather discovery, of Saussure by literary theorists, the relation between linguistics and literature was not made clearer. This is partly because linguists in the 20th century, following Humboldt and more recently Chomsky, tended to view language as an abstract system, whereas the principal domain of the literary critic was in the

textual features of the text as artifact. Stylistics thus continues to see the text as the object of study, but instead of seeing it as part of a system, sees it more simply as a site where language is organized, and proceeds to utilize the methods of descriptive linguistics for a more focused and less subjective analysis of those textual features. For the stylistician, then, the text is both data (as a linguist) and artifact (as literary critic). This assumption of the literary artifact (and acceptance of it) has led to the stylistician's domain object being largely simply the literary canon. Literary stylistics does not engage much in debates about the canon (on the whole) – it accepts it as its object of study and analysis. This is because it is not a coherent theory of literature as such, but a collection of possible methodologies. As noted, stylistics often borrows from whatever methodology is prevalent in mainstream linguistics. Traffic the other way – stylistics influencing mainstream linguistics – is almost unheard of. The influence of Saussure brought literary criticism and linguistics both to treat the text synchronically (that is, without regard to time). Stylistics is still a predominantly synchronic approach which has found no parallel to the historicist developments in literary theory that have dominated since the late 1970s.

An important development in the broad field of linguistics in the late 20th and early 21st centuries is that of 'cognitive linguistics.' Cognitive Linguistics (as part of a broader 'cognitive science') is most notably associated with the work of Giles Fauconnier, George Lakoff, Ronald Langacker, Mark Turner, and Eve Sweetser, among others. Much is made of the supposed *antiobjectivist* stance of the cognitivists, where language, thought, and conceptualization are seen to be *embodied*. Embodied experience is expressed through metaphors (hence the cognitivists' obsession with this trope), and knowledge is constituted through and by what are known as *conceptual metaphors*.

Cognitive stylistics naturally takes its lead from cognitive psychology and linguistics, having a number of key assumptions. The first is to do with the 'embodied mind,' an attempt to heal the Cartesian split between mind and body. Mental activity is 'embodied,' in that physical and cultural functioning is interwoven and finds outlets in our use of metaphors and other tropes. Humans are said to conceptualize abstract concepts in concrete terms, where modes of reasoning are grounded in our physical being. Metaphors such as 'success is up' are said to demonstrate this. However, it is too easy to take this as a given, or simple cognitive disposition. Eve Sweetser has shown that such movements from the concrete to the abstract develop over a period of time.

The movement, for instance, from the following two meanings of 'see':

- (i) I see the cat
- (ii) I see what you mean.

shows a cognitive development in terms of historical semantic change. In its most enlightening form, particularly in the work of Sweetser, it can throw light on the development of semantic change and thus has a diachronic as well as synchronic aspect. There are some within the discipline who wish to replace the term 'stylistics' with the term 'cognitive poetics,' but, in my view, this is a dangerous move. The strength of the eclectic approach offered by stylistics is also its weakness: its restless search for new applications and new theories to galvanize the movement can also be seen as the capricious appropriation of others' work. The cognitive poetics 'revolution' shows the discipline of stylistics at its best and at its worst – sifting through the mass of theories and applications for the most appropriate for stylistic analysis and producing genuine interdisciplinary analyses or misappropriating theories and rushing too quickly to apply them to texts.

Catherine Emmott's (1997) work has made important contributions to our understanding of certain procedures of text-mapping, drawing on recent cognitive and discourse theories. Emmott avoids the pitfalls of what might be called the 'new' affective stylistics by resisting the temptation to speculate further upon the aesthetic considerations of the text. Cognitive poetics (sometimes given the term 'cognitive stylistics') has an uneasy relationship with literary theory, and indeed with traditional stylistics. We might, for instance, define 'literariness' in terms of "cognitive events triggered in the mind by linguistic stimuli" (Pilkington, 2000: 189). But how are we to locate and define those 'cognitive events' except by the description and analysis of the 'linguistic stimuli'? It is not clear how this is different from saying that the text produces a certain effect because of its relevant linguistic features. Traditional literary concerns reappear with a new metalanguage. The focus, as in other cognitive approaches, is, then, on how the text works (or how readers work the text) rather than what the texts means. The work of Stockwell (2002) and Semino and Culpeper (2002) outlines the major concerns of the 'new' stylistics and is usefully read alongside the more traditional stylistic work of Paul Simpson (2004). Jonathan Culler's (1975) notion of 'literary competence' is the main precursor here (in a literary-critical context), but there are also links to the earlier work of Stanley Fish (1970) and Wolfgang Iser (1978). The 'human mind' is the focus of critical attention; but the human mind is a troubling, elusive

thing whose functions and very being have to be inferred from human actions and processes. The principal difficulty is that as the analyses of individual texts proceed, the focus on the workings of the 'human mind' is diminished. Typically, as readings become more engaged with the manifest features of the literary text, claims about the 'cognitive' aspect of the analysis are more difficult to sustain.

An alternative to the cognitivists' approach is presented in the work of David Miall (e.g., Miall and Kuiken, 1994 and *passim*) and others. Miall's work draws on the work of Samuel Taylor Coleridge and grows out of the theories of both Coleridge and the 20th century formalist Victor Shklovsky. Other influences include the Dutch discourse analyst Teun van Dijk. Miall's claim is that the literary text is a universe "whose laws are distinctive" (1994: 2), echoing a more traditional view of the literary artifact. Although he on occasions assumes a crude notion of what constitutes 'ordinary language,' he makes some important observations regarding the nature of the literary text. Most cognitive approaches describe a 'resource-limited' system in which cognitive structures economize comprehension by deleting irrelevant propositions, inferring relevant propositions and building macropositions. But Miall suggests that literary texts reverse the economizing effects of schemata and other supposed cognitive features. Thus, Miall finds cognitive approaches inadequate and unable to account for the richness of literary language. At a stroke, he rejects a dominant approach and brings to the fore a traditional view of the literary artifact.

Closely allied to the burgeoning cognitive stylistics movement is the development of empirical stylistic analyses from the late 1980s. Empirical stylistics also draws on and is influenced by the growing field of corpus-based linguistic studies. It faces many of the same difficulties faced by the affective stylistics of Stanley Fish developed in the 1970s and the *Rezeptionsästhetik* of Hans Robert Jauss of the same time. Do we account for general dispositions of an ideal reader, or do we try to account for the readings of individuals? In all cases, what is the role of stylistic analysis? In such cases, the common assumption is that nothing is 'there' in the text until a reader construes it – a seemingly trivial point which nevertheless has potentially devastating consequences for a discipline based on the close analysis of manifest linguistic features. Studies such as Steen's (1994) into readers' processing of metaphor rely on conventional interpretation of informants' responses and the sifting and evaluation of data. The corpus of literary texts is already there, as it were, as given.

After the tremendous developments and upheavals in literary theory from the 1960s to the beginning of

the 1980s, criticism settled to a period of prolonged historicism, whether politicized or not. The dominant strains have been in historicized analysis, postcolonial and feminist (and postfeminist) work, including psychoanalytical approaches. To be sure, criticism could not sustain its relentless self-questioning forever, and there has been a certain amount of retreat from critical neuroses and a reassessment of earlier critical and literary issues – even such hoary old-timers as authorial intention. Certainly, literary theory turned away from the kinds of linguistic concerns that had been fundamental to its development in the 1960s through to the 1980s and focused more on extending and challenging the canon and on forging closer relationships with historical methodologies. In some ways, language-study (in its broadest sense) has rarely been further from the domain of ‘mainstream’ literary criticism; and theoretical inputs and influences from mainstream linguistics (or out the mainstream) are rare.

In stylistics, many of its traditional concerns are still being explored, despite the proclamations of the cognitive stylisticians. In journals, one will still find work on free indirect discourse, on ‘mind style,’ on metaphor and metonymy, on speech acts and pragmatics, on feminist stylistics, and on transitivity. This is partly due to the fact that a certain kind of stylistics (particularly evident in British universities) is essentially a pedagogical tool, and many of these topics and approaches are still the core of stylistics and ‘literary linguistics’ courses both in Europe and in the United States.

Stylistics in Europe has tended to engage with the interface of linguistic and literary theory more readily than the dominant British model (which is largely conservative in its eclecticism). European work – especially from The Netherlands, Germany, and Spain – has embraced movements both in linguistics and literary theory to produce challenging and often exciting readings of texts. European stylistics has tended to incorporate issues in philosophy, both ‘continental’ and ‘traditional,’ in its approaches and analyses much more readily than its more conservative counterpart. Here we are likely to find Derrida, Wittgenstein, Russell, Said, Gadamer, Kripke, and Spivak rubbing shoulders with Halliday, Chomsky, and Leech and Leavis, Greenblatt and Harris. Stylistics and literary theory are closely related in this eclectic tradition. This is partly due to a tendency in Europe to embrace European philosophy more readily than in Great Britain and the United States and a desire to integrate the empirical and the philosophical. Thus, the ‘great four’ of critical theory (and related fields) who so dominated and influenced cultural analysis in the 1960s, 1970s, and

1980s – Jacques Derrida, Roland Barthes, Jacques Lacan, and Michel Foucault – were assimilated into European cultural theory readily. Coupled with a tradition of stylistic analysis (as in the work of Teun Van Dijk), this philosophical and cultural assimilation gave rise (and to a certain extent still does) fertile cross-disciplinary literary analysis.

Lying, Honesty, and Promising

Promising and asserting are both speech acts, and as such they are regulated by practical norms as well as linguistic norms (e.g., norms of etiquette). Here we shall be concerned with the **moral** norms that govern these speech acts.

Informational Theories

Many philosophers take the view that the morality of an act – its rightness or wrongness – is a function of the harms and benefits this act brings to the agent and to others. These philosophers also hold that the main way promises and assertions affect the interests of human beings is when they serve as sources of information. So, they conclude, both promises and assertions are morally significant principally because, and in so far as, they purport to offer information. Let's call this the 'informational' view of the morality of promise and assertion. On this view, morality censures an unfulfilled promise or a false assertion because these deeds can harm others by giving them false information.

We are all obliged to take due care not to lead others to form false beliefs, at least where this might be harmful to them (Scanlon, 1998: 300). This obligation means that we must not set out to deceive people by making them insincere promises or telling them things that we know to be false. But it also means that we mustn't change our minds about what we promised we were going to do (without good reason) or make an assertion without adequate evidence. Someone who accepts a promise standardly forms the expectation that the promisor will perform, and they may rely on this expectation to their detriment. Someone who believes an assertion is similarly exposed, if this assertion turns out to be false. I'll deal with informational theories of promising first and then move onto assertion.

Information theorists of promissory obligation fall into two categories. First, there are those (sometimes called 'expectation theorists') who argue that we are all under an obligation not to mislead others about how we shall behave in the future and that this obligation is why we ought not to make them promises that we do not fulfill (Scanlon, 1998: Chap. 7; Thomson, 1990: Chap. 12). Second, there are those who argue that we are obliged to fulfill our promises only where there is an up and running practice of

fulfilling one's promises: prior to this, there is no promissory obligation. For such 'practice theorists,' promissory obligation is conventional (Hume, 1978: Book III, Part II, Section V; Anscombe, 1981; Prichard, 1968).

Practice theories differ from expectation theories in their account of how the obligation to keep a promise arises from our interest in having correct information about how other people are going to behave. According to the practice theorist, we can create expectations of performance in our audience by uttering words like "I promise" only where there is an actual practice of making such utterances true, i.e., where people have come to feel some obligation to make them true. So one can't explain the moral significance of this utterance simply by reference to the expectations it creates. Still the practice theorist agrees with the expectation theorist that we are obliged to maintain the practice of promise-making where it exists, because this practice serves our information interest and thereby aids the coordination of behavior.

Turning now to assertion, there is much controversy among philosophers of language about the extent to which language in general, and assertion in particular, involve social convention. For example, Davidson maintains that "there is no known, agreed upon, publicly recognizable convention for making assertions" (Davidson, 1984: 270), and he thinks the same is true of promising. On the other hand Fried urges that the promisor has "intentionally invoked a convention whose function it is to give grounds – moral grounds – for another to expect the promised performance" and "to abuse that confidence is like . . . lying: the abuse of a shared social institution that is intended to invoke the bonds of trust" (Fried, 1980: 16). Thus, there is a division among information theorists of the morality of assertion parallel to that between expectation and practice theorists of promissory obligation.

It has long been debated whether there is any morally significant difference between lying to someone and deceiving them in a more oblique fashion (e.g., by way of false implicatures, deliberate ambiguity, or by leaving misleading evidence around, etc.). And this debate reflects a genuine ambivalence in our everyday attitudes. Where we feel entitled to deceive others – for the sake of their health for instance – many of us are still inclined to go to the trouble of trying to avoid telling a direct lie. On the other hand, where such deception is wrong, the wrong is seldom thought to be mitigated just because a direct lie was avoided.

There is a tradition of thought, however, according to which lying is always wrong, but we are sometimes permitted to deceive in other ways (Aquinas, 1966: II-II 110 a3; MacIntyre, 1995: 309–318). But

many contemporary writers have expressed doubts about whether the manner of the deception could by itself make a serious moral difference (Sidgwick, 1981: 354–355; Williams, 2002: 100–110). An expectation theorist who maintains that the wrong of lying is only the wrong of deception will share these doubts (Scanlon, 1998: 320). On the other hand, a practice theorist of the morality of assertion may allow that, in addition to any harm he does to the person he deceives, the liar is abusing and thereby undermining a valuable social practice (Kant, 1991: 612), namely the use of language to convey information.

Noninformational Theories

Until now, we have been assuming that what makes an act, including a speech act, wrong is, some harm that it does to those it wrongs in the end. There are many moral theorists who reject this assumption, and it is open to them to propound noninformational theories of what is wrong with a lie or a broken promise. Rather than attempt a comprehensive classification of noninformational theories, I shall consider one such theory of promising and one such theory of lying, both taken from Kant.

Take promising. Kant locates the moral significance of promising not in the information interests it serves but rather in the fact that it grants the promisee a certain moral authority over the promisor: it entitles the promisee to require the promisor to perform and thus deprives the promisor of a certain moral freedom (Kant, 1996: 57–61). If I promise you a lift home, I am obliged to give you a lift unless you release me from this promise. This line of thought was central to classical theories of promissory obligation (Hobbes, 1991: Chap. 2) and has found an echo in some contemporary writing (Hart, 1967: 60). For these authors, a breach of promise wrongs the promisee, whether or not it also harms them by inducing false expectations in them, because it flouts the moral authority that the promisee has acquired over the promisor.

On this view, informational theories miss what is distinctive about promising. There are many ways of influencing people's expectations and of co-ordinating your behavior with others (Raz, 1977: 215–216). For example, one can predict that one will do something or even express a sincere intention to do something, while making it clear that one is not promising. To promise to do it is to express the intention to undertake an obligation to do it (Searle, 1969: 60), an obligation that mere expressions of intention or predictions do not bring down on the speaker, however firm or confident they may be. If

I predict, on excellent evidence, that I shall be going in your direction because the police will be towing my car in that direction, I have not committed myself to making it true that I shall be going in your direction when that prediction threatens to be falsified.

Turning now to lying, Kant makes a firm distinction between wrong one does in deceiving someone and the wrong one does by lying (Kant, 1996: 182–184). One can lie without deceiving (e.g., when one knows one won't be believed) and one can deceive without lying. On deceiving someone you may wrong them but, according to Kant, when you lie, the person you wrong is yourself. The liar violates a duty to himself (though this violation need not involve harming himself). On explaining the nature of this wrong, Kant follows thinkers like Aquinas in attributing a natural teleology to speech:

communication of one's thoughts to someone through words that yet (intentionally) contain the contrary of what the speaker thinks on the subject is an end that is directly opposed to the natural purposiveness of the speaker's capacity to communicate his thoughts (Kant, 1996: 182).

In lying, one violates a duty to oneself by abusing one's own faculties, by using oneself "as a mere means (a speaking machine)" (Kant, 1996: 183). It may be possible to capture Kant's basic idea here without reference to natural teleology or duties to self if we adopt a certain view of assertion.

One can distinguish two currently influential theories of assertion. In the first, inspired by Grice, asserting that *p* is a matter of uttering something with the intention of thereby getting your audience to believe that *p*, by means of their recognition of that very intention (Grice, 1989). If something like this statement is correct, the moral significance of an utterance *qua* assertion must lie solely in the effect it is trying to achieve, i.e., in the effect that the assertion has on the beliefs of others. In the second view of assertion, asserting that *p* is more like promising that *p*. In promising, someone intentionally undertakes an obligation to perform: undertaking such obligations is what promising consists in. Similarly to assert a certain proposition is, on this view, to intentionally undertake an obligation to ensure that one asserts only what is true (Dummett, 1973: 299–302) and, perhaps, to defend one's assertions as true, should they be challenged (Brandom, 1983). Putting oneself under such obligations is what assertion consists of.

Once the second view is in play, we can say what is wrong about lying without making reference to the effect that the lie has on others. A liar is in the wrong

not because he is wronging someone but because he knows that he is taking on obligations he cannot discharge. In this way, lying differs from deception that wrongs the deceived when it harms their interests in some way. Deception is an offence against others while lying is an offence against truth. Provided morality is not solely concerned with harm, this offence may be counted as a moral wrong.

Marxist Theories of Language

This article is reproduced from the previous edition, volume 5, pp. 2390–2393, © 1994, Elsevier Ltd.

The hinges of a Marxist consideration concern the links binding the language to the structure of society, to models of material praxis, and to forms of ideology. An evaluation of the relationship between Marxism and the sciences of language coincides with the overall judgment expressed by many scholars on the historical experience of the so-called ‘real socialism’: the questions on the agenda are relevant and unavoidable, but the answers given are, on the whole, misleading or disappointing. The questions posed by Marxism as an interpretive methodology of social relationships may be worded as follows: which linguistic arguments prove that ‘man is the sum of social relationships?’ How are the different systems of beliefs, socially shared knowledge, cultural values, and rules of a human community continuously rebuilt in his language? How do the ideal–typical needs for mutual understanding and the real contingencies of differentiation and social struggle weave together in the language? These queries question all the symbolic articulations connected with the difference between manual labor and intellectual work.

Looking for a ‘True’ Marxism in Linguistics

What is the meaning of ‘being a Marxist in linguistics?’ First of all, it must be stressed that from a methodological point of view, it is not a question of applying Marxism to linguistics (Ponzio, 1989), as such an approach carries the idea of a ‘will of power,’ which is not acceptable for cultural practices guided by the paradigm of the search for a historical, consensual truth. Any attempt at a mere external application legitimates a defense mechanism aiming at protecting the autonomy of language science against the obtrusiveness of ideological knowledge. To adhere to a Marxist theory of the language does not mean to draw the proposals of a linguistic explanation from the dogmas

of social philosophy, but to identify a route of interpenetration between the problems posed by linguistic practice (or reflection) and the possibilities of an unbiased analysis of the same at a social level, just like the one Marx carried out to explain how the capitalist economy of his time worked.

Classics’ Indications

The hypothesis of a direct accessibility between Marxism and language sciences may seem surprising when one considers that the assertions concerning language are poor and fragmentary in the classical literature of Marxism. Some passages from the *German ideology* are extremely enlightening, especially those where Marx and Engels (1970) explain that language originated from the need for relationships with others, and is the matter that from the beginning ‘contaminates’ the spirituality of a ‘real, practical conscience,’ which is typical of man. Other noteworthy references can be found in the section about *Nature’s dialectic*; here Engels develops Darwin’s theme of the ape’s humanization processes and suggests the existence of a strict connection between language and work. Of course, from an early date (Lafargue, 1894), scholars’ attention was attracted by the possibility of identifying a class-prejudiced characterization both in the use of language and in the process of its historical evolution (see *Class Language*). This assumption does not justify in the least the absurd contraposition of a ‘socialist’ or ‘revolutionary linguistics’ to a ‘capitalist’ or ‘reactionary one,’ which would necessarily occur if Marxist theoretical and ideological principles were schematically applied in a scientific investigation of linguistic problems.

Scylla and Charybdis in Marxist Linguistics

A subtle plot of historical and political conditions led Joseph V. Stalin to denounce the fact that Mikolai J. Marr (the recognized spokesman of Marxist theory in linguistics until then) had incurred such an aberration in his doctrine, as he had reconciled his own monogenetic (or Japhetic) hypothesis of language with assertions about its superstructural and class-prejudiced nature. The great normalizer of the Soviet State often intervened in the linguists’ debate published

in *Pravda* (summer 1950), and – as an expert on Marxism, not on glottology – he presumed to outline the correct picture of a Marxist interpretation for linguistic questions. Stalin's position – which seems to be supported by common sense and is consistent with the scientific programs of Saussure's structuralism and Durkheim's sociology – turns out to be fundamentally incorrect both in its method and in substance, although it is absolutely justified by virtue of a certain sociolinguistic policy. As a matter of fact, on the one hand, the pretension to solve a scientific debate by a substantial appeal to authority appears unacceptable; on the other hand, the rebuttal of Marr's thesis is carried out with the help of trivializing arguments. However, from the point of view of the history of thought, Stalin's intervention is an affirmation and, at the same time, a denial of a Marxist theory on language. It is an affirmation because it demonstrates *de facto* that any theoretical language elaboration is bound by reasons of social and political practice. Language sciences, too, obey precise constraints deriving from the development of human relationships and draw inspiration from the ideological climate in which a society lives. Actually Stalin's concern to preserve languages conceals the 'sovietization' process imposed on the different nationalities gathered in the former USSR, and aims at defusing social conflicts. But Stalin's position patently clashes with that dimension of Marxist theory, so it necessarily adheres to a 'critical linguistics,' that is to say, a linguistics that tries to unveil the dominant mechanisms operating in communicative practices (see **Critical Discourse Analysis**). For a number of reasons, Stalin could not adopt such a view, and in order to avoid the problems that Marr had reasonably posed but incorrectly solved (Borbé, 1974), he takes refuge in an attitude of denial: as a language system has its own autonomous organization and is an instrument of national identification, language is not a superstructure and does not have a class character, so Marrism is not the equivalent of Marxism in linguistics. Stalin's position is not only mistaken, as he commits the 'minimalist error' (Mey, 1978) of considering language as a mere by-product of the cultural life of a nation, but it is also responsible for putting an end to the debate on the potential of Marxism in linguistics, through its own mystification (Marcellesi and Gardin, 1974).

Language Sciences and Critique of Ideologies

If we escape both monsters of Marrism and Stalinism, are there other implemented models of interpenetration or mutual control between the social theory of Marxism and linguistic questions?

'Bakhtin's Circle'

In fact, an authentically Marxist position in the language sciences is worked out in the postrevolution decade in Russia by the so-called 'Leningrad School.' Michail M. Bakhtin (see **Bakhtin, Mikhail Mikhailovich**), Valentin N. Voloshinov (see **Voloshinov, Valentin Nikolaevich**), and Pavel N. Medvedev tried to develop a semiotic theory of culture based on Marxist principles. Their conceptual pattern set three interpretative routes: decoding psychic processes both historically and socially; exploring the polyphonic dialogics intrinsic in a language; identifying the sociological constraints of a literary text. The Marxist relevance criterion of such an approach is the criticism of the forms of ideology and the way ideology works. In Voloshinov's opinion (1973), a Marxist conception of the problems posed by language philosophy is warranted by the need to explore the sign nature of ideological phenomena. As a result, the study of the ideologies embodied in the ethical, religious, juridical, political, and literary institutions of a society must be based on an explanation of the principles regulating their constitutive elements: i.e., signs. The identification of the ideological sphere with semiotics enables us to explain the formation of an individual conscience as a socio-ideological phenomenon; one must therefore imagine an unseizable dialectic interaction between the mind's working and the activation of sign-ideological systems (see **Dialogism, Bakhtinian**). The specifically psychological aspects of such an explanatory route were developed by Lev S. Vygotsky (see **Vygotskij, Lev Semenovich**); his theory advocated that superior psychic processes (memory, language, will, etc.) are interiorizations of social interactions mediated by signs. To explain the connection between language and ideology, Voloshinov resorted to a meta-procedural strategy: he showed which ideologies are carried by linguists. Two macrotrends are therefore identified in the study of language, which appear as epistemological constants and are still in force: individualist subjectivism (from Humboldt to Croce and Vossler) and abstract objectivism (which was exemplarily represented by Saussure). Voloshinov demonstrated that the Marxist point of view calls for an analysis of the socioideological material 'molded' by verbal interaction in order to rebut both the unsubstantiality of individual creativity in linguistic expression and the narrow-mindedness of a superindividual system of rules escaping the manifold pressures of language usage.

Social Cognition and Linguistic Praxis

The debate interrupted by Stalin and the programs started by the 'Leningrad School' were reconsidered

in the 1960s both by Soviet scholars who were interested in giving a historical and materialist direction to semiotic structuralism (Reznikov, 1964) and by other scholars working in the field of social criticism in the capitalist West (Cornforth, 1967). An interesting bridge between these two perspectives had been sketched in Italy by Antonio Gramsci's brilliant intuitions and was later consolidated in Poland by Adam Schaff (1967). The need for a 'Marxist linguistics' was set by the Polish philosopher in the sphere of a knowledge theory beyond the opposite extremes of mechanistic materialism and subjective idealism. According to Schaff, a Marxist theory emphasizes the role of mediating procedure that language plays between what is subjective and objective, mental and social, biological and cultural. This theory acts as a central support for a conception of man as the being who is responsible for the creation of his own cognitive and relational models. Even if some differences can be found from the point of view of inner logic as well as on the level of phylogenetic and ontogenetic acquisition, the process of 'thinking-speaking' is substantially unitary, as cognition is an effect of social praxis and communicative relations are full of cognitive contents. This dialectic unity enables us to reject both the reflex theory suggested by a naïve materialism and the theory of significant systems autonomy, proposed by some updated versions of idealism. Furthermore, Schaff's Marxist language theory aims at being immediately employed in the practical questions weighing on the decision-making ability of a human person as an actor and a maker of his or her social world. On this subject, Schaff also considers a social categorization process that emphasizes the connection between ideology and language, that is, 'thinking-speaking by stereotypes.' The resort to stereotype and to prejudice gives emphasis to the fact that as the relationship between the individual mind and reality is mediated by the sphere of meanings, the workings of the mind itself are influenced by historical and social conditionings. Stereotypes reveal the real control that social groups have over the contents and processes of individual thought. Schaff's pragmatic point of view allowed him to give stereotypes of the sociointegrative and defense functions that make the workings of the mind compatible with the political structure of society. Similar conclusions are drawn by all those currents of sociolinguistics and pragmalinguistics that wonder about the connections between the conscience of sociality carried by the language and the limits of what the historical conditions of praxis allow human subjects to mean when they are diversified by factors such as age, sex, culture, class, degree of social control, etc. Some theories within 'social linguistics' are marked

by an implicit adhesion to a Marxian inspiration, such as 'praxematics,' coming from Lafont's school or Mey's pragmatic approach. Lafont (1978) works out a linguistics focused on the 'praxeme': this is an instrument for the production of sense in speech and, at the same time, a unit of analysis in the relation between the language user and the practical social conditions that make it possible for the uses of linguistic varieties to clash. In outlining the basic question '*Whose language?*,' Mey (1985) makes a constant, critical comparison between the categories obtainable from analysis of industrial society (such as production, oppression, and manipulation) and the instruments of linguistic analysis. According to Mey, the Marxian inspiration in sociolinguistics lies in the need for a theory that can explain the intricate relationship between language as a sociocultural product and the forms of the overall reproduction of a society. The solution he proposes entrusts pragmatics, as the theory of linguistic use, with the task of explaining the various 'wording' possibilities connected with the clashing nature of groups, with different approaches to knowledge and with different power distributions.

Sign Systems and Social Reproduction

The principles of historical-dialectical materialism imply that language is interpreted by abstractions that are in turn determined by the sum of practices regulating man's 'organic exchange' with nature, bearing in mind the often distorted representations imposed by the historical limits within which man is obliged to live his social relationships (Erckenbrecht, 1973). The Marxist idea of language aims at specifying the features of the production of sense carried out by man in the present circumstances of his history and, therefore, at identifying the role of sign systems within the process of 'social reproduction' as a whole. This category indicates the totality of techniques and procedures through which human groups perpetuate their presence in the world. In this perspective, Ferruccio Rossi-Landi's tentatively investigated connection between language and work is justified (1983). At first sight, Rossi-Landi seems to exaggerate when he applies the Marxian labor theory of value to the field of language and to other nonverbal forms of human communication. Indeed, the most important thing is the epistemological and methodological indication of the need for passing from the surface level of exchange and/or the sign market to the underlying level of social labor that is implicit in cultural signification and communication processes. This change of focus makes it possible to criticize the dichotomy traditionally accepted by linguists (out of common sense) between the 'system' and 'use' of the language, both in its classical version of Saussure's

opposition between 'langue' and 'parole,' and in its neoclassical version of Chomsky's opposition between 'competence' and 'performance.' The adherence to these two categories enables linguists to exorcize the fetish of an explanatory autonomy, by confining the pertinence of Marxism to the illustration of the social function of a language. By the contrast, in Rossi-Landi's view, those abstractions are useful only if they are rooted in the ground of 'common speaking,' which defines historically the linguistic *a priori* of the human being. The philosophical methodology of 'common speaking,' which was later generalized in a semiotic methodology of 'common semiosis' by Rossi-Landi, achieves the Marxist theory target of unveiling the ideological consistency of the 'logosphere' and clarifies the mediating role that sign systems play between the economic basis and the super structures of society.

What Shall We Do?

The Marxist perspective, however narrow it may appear, binds those who study linguistic problems to historical-dialectical materialism and obliges them to consider the connections between linguistic theory and the theory of praxis as being relevant. This double bond results in the urgent need to explore the linguistic signs' ideological texture. But for the linguist, the adherence to such an explanatory route entails the commitment to carry out his own language investigations according to an emancipatory project concerning the potentials of human beings. To be a Marxist in linguistics means to adopt an intrinsically debunking perspective of the relationships of social control that are formed and/or expressed in the language. Of course, it is not necessary to be a Marxist to work out a critical and emancipatory linguistics, but the opposite is true: it is necessary to take a critical attitude to be authentically Marxist in linguistics. Marxism aims at putting a sort of 'meta-semiotics,' meant as a critical theory of ideologies, at the basis of the language sciences. This perspective is shared by those (such as the late Pierre Bourdieu) who try to use Marxian categories (class, commodity, labor, surplus value, alienation) in the analysis of the

relations of linguistic reproduction in society, and by those who take only a critical stance from Marxism, thinking that this is enough to perfect the technical solutions provided by linguistic knowledge. Both 'revolutionaries' and 'reformers' share the same desire to look for a small red petal in the white cup of reflexation on language.

Maxims and Flouting

A K Greenall, Norwegian University of Science and Technology, Trondheim, Norway

© 2006 Elsevier Ltd. All rights reserved.

Maxims and *flouting* are two closely interrelated terms central to the Oxford language philosopher H. Paul Grice's famous theory of the Cooperative Principle, which first emerged in the William James lectures that Grice delivered at Harvard University in 1967 (see **Cooperative Principle**; Grice, Herbert Paul.) Grice's project was to try to reduce the number of meanings for lexical items ("Grice's razor" [Davis, 1998: 20]), and he did this by postulating a new, separate type of non-semantic meaning that he called *implicature*, a type of meaning that is not semantically coded but arises in conversational context (see **Implicature**).

The generation of implicature is crucially connected to the workings of an overall *Cooperative Principle* and a set of conversational *maxims*.

The Cooperative Principle

Make your conversational contribution such as is required, at the stage at which it occurs, by the accepted purpose or direction of the talk exchange in which you are engaged (Grice, 1989).

The Maxims

Quantity

1. Make your contribution as informative as is required.
2. Do not make your contribution more informative than is required.

Quality

1. Do not say what you believe to be false.
2. Do not say that for which you lack adequate evidence.

Relation

1. Be relevant.

Manner

1. Avoid obscurity of expression.
2. Avoid ambiguity.
3. Be brief.
4. Be orderly.

These maxims may either be observed or breached, and in both cases implicatures may arise. The maxims can be contravened in a number of different ways, but crucial importance was allotted to the *blatant, intentional* contravention of one (or more of the) maxim(s), or *flouting*. On spotting such a blatant breach, the hearer – who will always retain his or her belief that the speaker is being cooperative – will immediately begin a search for an additional or alternative meaning for the utterance, one that *observes* the maxim(s) in question and thus follows the Cooperative Principle. The result of such a search is the implicature. Consider the following example:

A: Are you going to Anna's party?

B: Well, Anna's got this new boyfriend now.

B's reply here clearly breaches Grice's maxim of Relation (the only truly relevant answers to A's question would be *yes* or *no*). According to the theory, spotting this breach would set off a reasoning process in A, along the following lines:

1. B has said that *Anna's got this new boyfriend now*.
2. This utterance breaches the maxim of Relation.
3. I have, nevertheless, no reason to believe that B does not intend to observe the Cooperative Principle and the maxims.
4. B could not be doing this unless what he really wanted to convey was something different from what he literally says.
5. On the basis of the available context (e.g., that B really liked Anna's old boyfriend), what B really wanted to convey was, *no* (*I am not going to Anna's party*) (a *relevant* reply, i.e., one that is not in breach of the maxim of Relation).

Note how this example illustrates the context-dependency of implicatures. If the context assumed in 5 were *B really disliked Anna's old boyfriend*, the interpretation (implicature) would be the opposite, namely, *yes* (*I am going to Anna's party*). (see **Context, Communicative**.)

What Is a Maxim?

The concept of maxim is a crucial notion within the theory of the Cooperative Principle. Grice's own characterization of the entity is many-faceted. First of all, he was unambiguous on the point that the maxims are descriptive rather than prescriptive. Our rational nature, according to Grice, leads to the observable situation that the maxims are observed (more often than not). That is, he never meant that the maxims *should always* be observed, one of several common

misunderstandings which has marred the field of Gricean pragmatics since its beginning (Thomas, 1995: 56).

Another noteworthy aspect of Grice's characterization of his maxims is that just because they are seen to have a basis in human rationality, they are not therefore to be considered innate. Furthermore, he was also attracted to the idea of maxims as *general interactional principles* governing both non-verbal and verbal behavior. Finally, the proposed set of maxims was seen as *expandable*: "There are, of course, all sorts of other maxims (aesthetic, social, or moral in character), such as 'Be polite,' that are also normally observed by participants in talk exchanges, and these may also generate ... implicatures" (Grice, 1989: 28).

In the post-Gricean literature, there are roughly three main approaches to maxims. The first tries to tighten the association between the maxims and human rationality. The main representative of this approach, Asa Kasher, does this by postulating principles of rationality from which Grice's maxims are seen to derive (Kasher, 1976). The second, more influential approach, alienates itself most strongly from Grice's original formulation: here, the maxims are redefined as innate, linguistic rules that are always observed and that will produce the same implicatures irrespective of context (e.g., Atlas and Levinson, 1981; Horn, 1984). This formalist, cognitivist approach, in its quest to 'purge' the Gricean scheme, often ends up reducing the number of proposed maxims, a trend that culminated in the theory of relevance proposed by Sperber and Wilson in 1986, in which all the maxims were collapsed into one, cognitive, Principle of Relevance. This is in stark contrast to a completely opposite trend, found in the third approach to maxims, the social pragmatics approach. Geoffrey Leech (1983), adopting Grice's view of maxims as learned entities, ends up adding a large number of maxims to Grice's scheme.

The main drawback of the formalist, cognitivist approach is clear: they see maxims as rules that are in principle always followed, and hence this kind of theory cannot account for that which is observed when some such entity as a maxim is *breached* (e.g., flouted), namely, the emergence of a layer of underlying meaning (implicature). Support for this observation has come from a perhaps unusual angle: research in Artificial Intelligence has shown that, in order for computers to communicate efficiently with human beings, they need to observe all the Gricean maxims at all times. If they do not, the human communicator will invariably read more into the computer's utterance than the devisers of the program intended (Bernsen *et al.*, 1996).

The main criticism of the social pragmatic approach has revolved around their uncritical, *ad hoc* proliferation of maxims (see, e.g., Brown and Levinson, 1987). A weakness of *all* approaches, including the social pragmatics approach, is the widespread belief that there must be an ultimate, fixed set of universal maxims where each can be classified and labeled individually. This despite the fact that the universality of maxims was drawn strongly into question as early as the mid-1970s, in Elinor Keenan's (1976) famous study of a Malagasy community, in which the influence of an informativity maxim (Quantity) was shown to be absent in certain speech situations. Unfortunately, rather than drawing attention to the eclectic sociocultural reality of Gricean maxims and other such entities, Keenan's work was applauded as a refutation of Grice's claims by those who believe that universality is the only valid stamp of approval for maxims.

The varied appearance of maxims around the world makes likely the hypothesis that one cannot ever hope to be able to enumerate and label every single maxim – the list of entities that can be flouted to produce implicature is probably open-ended. This, of course, calls for a detailed and succinct definition of the notion, to stand guard at the door, controlling which new maxims get in. A simple solution would be to adopt a functional definition such as that proposed by François Récanati (1987: 133), to the effect that a maxim is an entity that can be flouted to produce implicature (see also Levinson's 'general principle' [1983: 132]). The success of such a definition would, however, depend on whether or not one has reached a satisfactory understanding of the notion of *flouting*.

Flouting: Past, Present, and Future

As was noted in the first section of this article, flouting is the blatant breach of one of the maxims. Because all hearers embody faith in the speaker's inherent intention to be cooperative (i.e., to observe the maxims [at some level]), a seeming breach will trigger a reasoning process whereby the hearer will try to come up with a meaning for the utterance that *turns it into* an act of observing the given maxim(s) (an implicature).

There are several problems with this model. First of all, it is unlikely that it is the hearer's belief in the speaker's cooperativity that is the reason behind the former's quest to retrieve an implicature. This is especially the case if one chooses to include politeness maxims into the scheme: if a politeness maxim is breached, the implicature is hardly ever more polite than the act itself (consider, e.g., the act of turning away when one should have greeted somebody, in

order to implicate, for instance, that one considers that person to have done something despicable). Another serious problem is that the reasoning process the hearer is supposed to go through is psychologically implausible. And finally, the end product of this process, the implicature, is presented as an entity that is easily circumscribed (a fully fledged proposition), whereas real life might prove to be far less ordered, with several half-formed, semi-verbalized hypotheses as outcome.

Despite these problems, which are clearly in need of serious attention, there has been a curious neglect of the notion of flouting in post-Gricean theory-building. The interest from empirical researchers has, by contrast, been tremendous. The notion is used as an analytical tool in a large array of studies in a multitude of extra-pragmatic and semi-pragmatic fields such as, e.g., literary criticism (e.g., Bollobás, 1981), humor studies (e.g., Attardo, 1990), or gender studies (Rundquist, 1992). Such widespread application clearly confirms the theoretical value of the notion. However, as very few have felt the need to make any significant amendments to the theory (apart from the occasional addition of a 'new maxim'), the problems remain.

In the theoretical literature, it is mainly the strong focus on observance (largely because of a reluctance to deal with the troublesome notion of context) that has obscured the need to deal with the notion of flouting. The discussion above related the formalist approach with their definition of maxims as context-independent rules that are always to be observed. Another trend manifests itself by interpreting every observed breach of a maxim not as a breach, but as the observance of an invented, 'opposite' maxim (e.g., a breach of Be brief would be seen as an observation of 'Be wordy') (see, e.g., Joshi, 1982).

A particularly serious form of neglect is, of course, outright rejection, as in Sperber and Wilson's highly influential, and heavily criticized, Relevance Theory (1995). (see **Relevance Theory**.) Maxims, as envisaged by Grice, are afforded no place in a theory of indirectness, and the notion of flouting leading to implicature is replaced by the idea that implicature should be arrived at by a continued search for relevance, when the literal interpretation yields none. The problem for Relevance Theory is, of course, empirical evidence such as that mentioned in the previous section (Bernsen *et al.*, 1996), which shows without a shadow of a doubt that maxims (or something like them) *are* involved and that breaching them *does* have the effect of stimulating the interpretation of indirect meaning. In addition, there are interesting indications that Grice may have stumbled on to something that is in reality part of an even larger scheme than he

envisaged. In experimental social psychology, it has long been noted that 'unusual events' are sociocognitive triggers for a search for an 'explanation' (the 'expectancy principle' [Weiner, 1985: 81]). The breach of a maxim, being the departure from a norm, is also in this sense an 'unusual event,' and the search for an implicature has much in common with the description of the search for an 'explanation.' If this connection is viable, it holds great promise for the further development of Grice's model of flouting.

Conclusion

All in all, Grice himself offered merely 20 or so pages on the topic of maxims and flouting. Subsequent research offers much food for thought, but no viable theory has emerged that exploits the full potential of Grice's eminent point of departure. This does not mean that it is an impossible task to arrive at such a theory, but it would probably require a considerable reorientation of focus, possibly toward the sociocultural significance of both maxims and flouting.

Media and Language: Overview

S McKay, University of Queensland, Brisbane, Australia

© 2006 Elsevier Ltd. All rights reserved.

The mass media are generally considered to include the press, radio, and television; the Internet, although not strictly a medium, is also increasingly included. News and current affairs articles and programs, documentaries, sports news and broadcasts, radio phone-ins, advertisements, reality television, quiz shows, soap operas, websites, and so on help to organize the ways we understand our society and culture. They are often the only way we have of understanding other societies and cultures. The media's influence on everyday life is usually taken for granted. They supply accounts of reality and construct particular forms of knowledge and pleasure: they inform and educate, they sell products, they tell stories, they entertain, they connect us with others, they help form our identities, they influence trends and mobilize opinion, they circumscribe our experience in what has become a media-saturated environment.

Linguists and others working in language and communication have always been interested in the language of the media. Bell (1995: 23) gives four reasons for this: the ready availability and accessibility of media texts as sources of language data; the importance of media for evidence of language use and language attitudes in a speech community; the use the media themselves make of language; and the way the media reflect culture, politics and social life. Not surprisingly, other researchers from a range of disciplines and fields such as media studies and journalism, communication, cultural studies, sociology, education, and psychology have also been interested in how the media shape these understandings.

In these fields, media are studied not just through their texts but also through the wider cultural contexts associated with industrial production processes, and through the effects they have on their audiences (for example, Watson, 1998; Curran and Gurevitch, 2000). While texts are at the center of any concern related to language and the media, the analysis and critique of production processes and audience effects are often valuable as well. This article will discuss a variety of approaches to media analysis and outline briefly some of the recent debates about the media to emphasize the usefulness of the range of critical resources that have been applied to media texts and media language.

Approaches to Media Language Analysis

Media texts have been analyzed both quantitatively and qualitatively. Early work, especially in the United States, concentrated on content analysis. Content analysis focuses on the message and assumes that its content can be broken down into units of meaning that can be counted in a process that is designed to be objective and replicable. Much of this early work looked at the content of American newspapers, especially on subject matter categories like politics, crime, and sports. Towards the end of the 1930s, Harold Lasswell, who was interested in the relationship between propaganda and public opinion in the 'new' mass medium of radio, used content analysis to investigate political values. During World War II, the U.S. government, through the Experimental Division for the Study of War-Time Communications under Lasswell, conducted the 'World attention survey' through a content analysis of major newspapers, which was designed to investigate newspaper coverage of foreign affairs. Others investigated the propaganda output

from various organizations and individuals, focusing on aspects like the 'values' expressed in political speeches or the 'tone' of the headlines. Essentially, the origins of this approach developed in the study of the content of newspapers, but then evolved to be used as a way of evaluating political messages, especially Nazi and Soviet propaganda messages during World War II and the Cold War.

Much of this research was quantitative, relying on coding aspects of content into a number of discrete categories and counting their frequency. Later content analyses applied a similar methodology to television, but just about every type of media communication has been studied. Modern content analysis is still used for news content or detecting political bias, but it has also been used to investigate topics like gender representation in advertisements, violence in children's television programs, and representations of minority groups (for example, the work of the Glasgow Media Group in the United Kingdom on the news; and the research by George Gerbner and his associates in the United States on the Cultural Indicators project).

The first edition of the *Encyclopedia of language and linguistics* included an article on media language as part of the communicative process and outlined a different and more theoretically based tradition in the study of media language. It started with semiotics to demonstrate the need to think of media language as part of a sign system or as a process of communication with complex social and cultural influences affecting the way in which media texts are produced and understood. The article reviewed the major approaches to the study of media language, such as critical linguistics, noting its approach to ideology and power in the representation of social reality, and its agenda in unmasking the seemingly objective nature of news reports; semiotics, especially as a way of decoding both verbal and visual aspects in advertisements; and discourse analysis, again primarily of news texts, but also phone-ins, interviews, and disc jockey monologues, with an emphasis on pragmatics, speech acts, and turn-taking. It noted a shift in emphasis away from textual analysis alone towards a more audience-focused approach.

Other overviews published more recently have outlined the research trajectories in language in the media through the work of individual linguists, especially with respect to the growing influence of Critical Discourse Analysis. Bell's (1995) overview maps out the approaches made in the study of media language and discourse from, first, Critical Linguistics and then Critical Discourse Analysis (CDA). He notes the growing importance of CDA and its sociopolitical concern to reveal inequalities of power as a standard approach to media texts, outlining the contributions

of Fowler through his development of Critical Linguistics to apply functional grammar to news texts; of van Dijk's using text linguistics to develop discourse analysis to apply to news story structure; of Fairclough's bringing social theory, especially the work of Foucault, to discourse analysis, and to his contribution, along with that of van Dijk, to the development of Critical Discourse Analysis with its explicit sociopolitical stance. Bell's own work links text analysis of news stories to media production processes and the role of the audience. Critical discourse analysts are interested in both details of the text itself and the broader social, political, and cultural functions of media discourse to determine other layers of meaning. Much of their work to date has been on the analysis of factual genres like news rather than fiction or advertising.

CDA has become an important approach for studying media texts, especially in European linguistics and discourse studies.

However, to argue uniformity in the CDA approach could be misleading. The use of the individuals' contributions to structure overviews of the field is instructive here. CDA is not a holistic approach, using a single theory or even a single methodology. Its foundations are derived from classical rhetoric, pragmatics, text linguistics, sociolinguistics, and applied linguistics and reflect the growing interdisciplinarity in research between the humanities and the social sciences. Ideology and power underpin applications of CDA to issues relating to gender, class, and ethnicity and also to more general discussions about media discourses relating to politics or the economy (*see Media, Politics and Discourse Interactions*). However, depending on the discipline background of the researcher, the methodologies may differ, with both large empirical studies found as well as small, focused qualitative case studies. Weiss and Wodak's (2003) volume covers some of the research practices under the umbrella of CDA, and their introduction outlines some of the critiques and debates that have evolved with it.

The dominant paradigms of media language research have tended to produce critical evaluations of the power of the media to influence and even to subordinate their audiences. As indicated above, much of the work on media language, especially in critical linguistics and critical discourse analysis, has been undertaken on the news and is concerned with uncovering its underlying ideologies. In particular, this work targets for special attention social problems like discrimination and prejudice (for example, van Dijk's 1991 work on racism). The studies undertaken in CDA are designed with an emancipatory purpose; that is, they have a sociopolitical agenda intended

to shed light on issues of power and domination. Thus, it should not be surprising to see so much CDA focused on the news.

News is not considered as some neutral image of the real world but as a product of news gathering and news making. In other words, news is the end result of a number of processes, including organizational policies and preferences that set the news agenda and selection and judgments about relative importance and significance. It is thus a representational discourse made by converting the raw data from a variety of sources, including eyewitness accounts, interviews, and media releases, into stories within the context of technical constraints like production deadlines, and in accordance with the news values of the time (*see Newspeak*). News values, or the set of criteria used to determine newsworthiness and hence whether or not an item is likely to appear as news, act as a filtering mechanism or gate-keeping device for what is reported.

The study of the news has always been at the forefront of media discourse research. The constructedness and selectivity of the news and its concentration on negative events, together with its connection to powerful institutions and commercial market imperatives, have proved compelling for language researchers, especially those who are interested in critical approaches to ideology, and have stimulated investigations into story content, underlying values, and structure, as well as studies of representations of specific issues and groups. However, media language has been studied at other levels beyond journalistic practices, media production processes, and textual analysis.

The traditional distinction between news and entertainment has transferred into analytic approaches, with linguists and discourse analysts using conventional, language-focused, empirical methods on news texts, especially on news content, news values, and ideals of objectivity. This has left theorists from other fields like sociology, cultural studies, and women's studies to supply much of the insight into the entertainment side of media output. It is from these traditions that studies about consumption, popular taste, the politics of the everyday, and notions of pleasure and resistance have been undertaken.

A major contribution here has been insights from reception studies into reading practices and how readers or audiences negotiate meaning and respond to various media texts such as soap operas and women's magazines, as well as news programs. These are questions that usually lie outside traditional language or discourse analysis. Audience research has been the mainstay of media and cultural studies research for some years now as researchers endeavor to find out how audiences make sense of media texts.

Reception studies have focused on specific genres to see how different social groups (based on age, class, ethnicity, or gender) or subcultures interpret texts in different ways. Hermes (1995), for example, in her analysis of women's magazines, draws heavily on responses from women who describe the pleasure they derive from reading what is often considered a devalued genre. Fewer studies have undertaken detailed linguistic analysis to relate textual features to audience interpretation. Richardson's work (1998) on economic reporting in television news is an exception here, as she links an analysis of media discourse on the economy with an analysis of the reception of that discourse.

Studying texts with images and sounds has presented challenges to conventional discourse analysis, which has valued modes of language through speech and/or writing over visual images or music. The mass media produce multimodal texts, that is, texts that draw from language, pictures, or other graphic elements and sounds in various combinations. Considerations of the multimodal nature of media texts are difficult to incorporate in language-based media analysis. Two examples of work on multimodality in the media, linked to linguistics, are Kress and van Leeuwen's work on text layouts (1998, 2001) and Cook's work (2001) on advertisements.

Kress and van Leeuwen have pointed out how the multimodality of the media needs to be taken into account when analyzing discourse. Their (1998) semiotic analysis of newspaper front page layouts shows how conventions related to the positioning of headlines, blocks of text, and photographs produce meaning and coherence; how visual cues (size, color, contrast) produce hierarchies of meaning; and how frames like lines and spaces produce separations or connections. They emphasize the importance of layout analysis in the critical study of newspaper language. The nature of advertising also means that analysts need to take account of pictorial and musical modes, even in advertisements where language predominates. Cook (2001) stresses the links between language in advertising with the other modes and urges analysts to understand the interconnections they make with each other to construct meaning. In spite of the difficulties in trying to capture such multimodality, concentrating on language and ignoring the other modes is to miss much of the potential for meaning of contemporary media texts.

Current Issues

The Impact of New Media

Researchers and other commentators have continued to be interested in media language and have expanded

the field to include newer forms of media, mainly through attention to computer-mediated communication (CMC) (*see Language in Computer-Mediated Communication*). The development of global, digital, networked communication systems and their infrastructure in the latter part of the 20th century has captured the public imagination in terms of the seemingly limitless potential to provide access to information and to facilitate interaction with others. This has been greeted with either utopian predictions of a better informed and more democratic society with greater facilities to connect and interact with others through the creation of virtual communities, or a darker view of information overload, unregulated content, personal isolation, and even loss of ability to interact face-to-face, and a 'digital divide' between those with access and those without.

New on-line technologies have transformed news through the capacity to accumulate unlimited multimodal information in a single text and to permit different routes of access and different levels of interaction. On-line news departs from the constraints of space and time associated with print and broadcast news and instead organizes vast amounts of information content as self-supporting layers with hypertext links (Lewis, 2003). In addition, various new forms of news have emerged with webcasts, web logs, news groups, and news alert services that provide constant access to news and embedded information.

Research on language use in computer-based media is struggling to keep pace with rapid technological innovations. The impact of the Internet and related technologies on language has been discussed (often negatively) in terms of language change and effects on literacy. Crystal's (2001) linguistic perspective offers evidence of the emergence of distinctive language varieties developing in Internet-related forms of communication, including e-mail, chat groups, virtual worlds (imaginary environments for text interactions), and the World Wide Web. In each, he notes adaptations in graphology, grammar, semantics, and discourse to suit the characteristics of the technology and its uses. Rather than forecasting the demise of the written form or, more dramatically, the death of languages as the result of the impact of new technologies, Crystal argues that the Internet is providing creative possibilities and enrichment opportunities for its users.

Work related to language in the new media has included studies on topics like web pages and hypertext links, e-mail discussion lists, and Internet video conferencing, and studies on themes like multilingualism in chat sites, the dominance (or not) of English in the new media, the extent of democracy, and the division between the information-rich and information-poor (for a range of studies, see Pemberton and

Shurville, 2000; Herring, 1996; Jenkins and Thorburn, 2003; Aitchison and Lewis, 2003). Language research has focused primarily on computer-mediated communication via the Internet, its relationship to face-to-face communication, and its relative anonymity, as well as textual aspects like special language features and idiosyncratic codes of conduct and etiquette (or 'netiquette'). E-mail users and Internet chat users have developed spelling shortcuts like letter homophones or acronyms as a kind of coded shorthand to speed up typing (by saving keystrokes), and even special symbols created originally from ASCII characters ('emoticons' like smiley faces) to add emotional content. These shortcuts and symbols also help to differentiate regular users from newcomers. The so-called 'netspeak' or 'netlingo' has spread beyond CMC, with similar shortcuts and symbols adopted by mobile telephone users for text messaging, and CMC jargon like 'flaming' and 'spamming' becoming more widely used and understood.

Internet communication channels like chatrooms, bulletin boards, newsgroups, complex hyperlinked websites, and electronic games need to be thought of differently from traditional media texts (*see Language in Computer-Mediated Communication*). Such texts are characterized by their interactivity but also by their intertextuality, as they draw on other texts and play with established conventions of form and representation (Buckingham, 2000). In addition, many new media forms with their built-in potential for interactivity make the traditional distinction between author and reader (or producer and audience) less important, as texts are cooperatively produced and meanings are created, challenged, and changed. While it may be compelling to foreground the benefits of intertextuality and interactivity in contemporary media texts, especially in terms of creativity and innovation, many texts produced in new media are just refashioned conventional texts whose interactivity is based on limited choice and pathways.

Revisiting Traditional Media

The more traditional media continue to generate research interest with new insights. Changes to the language of the media have been noted, such as growing tendencies for a more casual, conversational style with an increasing use of colloquial vocabulary and vernacular idiom by journalists and interviewers; a greater emphasis on celebrity; stress on the personal; and a marked trend to the short, sharp, sound bite designed to be pithy and provocative, especially when edited into news reports.

In debates about declining journalistic standards, the news media across a range of countries increasingly have been criticized for not separating news from

entertainment, for personalizing and sensationalizing stories, and for focusing on 'softer' or 'lighter' stories rather than concentrating on more serious issues in a process termed 'tabloidization' (for international perspectives on tabloidization, see Sparks and Tulloch, 2000). Mass-market magazine content also has become more sensationalized with a growing emphasis on celebrity coverage, gossip, scandal, and intrigue. Franklin (1997: 4) has criticized both print and broadcast journalism, commenting that "the trivial has triumphed over the weighty; the intimate relationships of celebrities from soap operas, the world of sport or the royal family are judged more 'newsworthy' than the reporting of significant issues and events of international importance."

While news and public affairs remain an important part of media output, a significant portion of television output is devoted more directly to entertainment through soap operas, dramas, talk shows, reality television, quiz shows, sports, and lifestyle programming. It is likely that the increasing global trend of the media supplying more and more of these shows is underpinning the tendency for the news to become more conversationalized and more 'tabloid,' as it too comes under market pressure to entertain and to connect more closely with ordinary values and practices.

Research has continued as well on a range of variously disenfranchised groups, including women, children, the aged, ethnic minorities, and disabled groups, and on moral panics, not just in the traditional sense of 'muggings' and escalating urban violence (Hall *et al.*, 1978) but in a more diverse sense that includes media coverage of issues related to pornography, pedophilia, health risks, and medical negligence. Research also has been conducted into media's role in language development and literacy.

These new and continuing directions in research are contributing to the growing critique of the media and how they operate. Contemporary media language is changing, especially under the influence of globalizing technologies and changes to the media industries that are affecting the way our social world is presented to us. As global media corporations operate beyond the symbolic spheres of national influences and cultures, we are seeing increasingly globalized programming and convergent technologies, but whether this will translate into a homogenized culture with a global language is not at all certain. It is more likely that improvements in technology will give us more choice about where we get our information from and how we entertain ourselves.

What is evident within the study of language in the media is a continuing trend away from just text-based and/or purely linguistic approaches, not

only in order to take account of factors surrounding media texts like the production processes, the characteristics of the medium, and the circumstances of audience reception but also to look at the nature of media language itself as it changes in relation to changing industry, social pressures, and emerging technologies.

Media, Politics and Discourse Interactions

B Busch, University of Vienna, Vienna, Austria

© 2006 Elsevier Ltd. All rights reserved.

Media texts are frequently being used as corpora in linguistic analysis, treating politics- and policy-related questions such as social inclusion and exclusion, stereotypes, and constructions of national or ethnic identities (Wodak and Busch, 2004). For instance, over 40% of the papers published in the journal *Discourse & Society* are based on media texts (Garrett and Bell, 1998: 6). There are different reasons for this: given their public nature, media texts are easily available and accessible, offering even a historic dimension through archives. Media texts can be assumed to have an impact as they address and reach multipliers or a more general large public. It can be assumed that they receive attention by their audiences, as their reception is voluntary. Media texts, as other texts in the public domain, provide discursive and linguistic resources that can be seen as authoritative voice (Bourdieu, 1982). Although also in media studies news is one of the most widely studied media forms, the connection between

media and politics has not been sufficiently investigated (Fiske, 1987: 281), and no coherent theory that integrates media theories, political theory, and social change has been developed so far.

The first part of this article discusses the correlations between media and politics. The historical perspective on developments in Western Europe shows a change of paradigms that becomes visible in the media order, in conceptions of the public sphere, and in media theory more generally. The second part focuses on approaches to the analysis of political discourse in the media. Given that the political field and the media field both undergo a process of rapid change, a flexible framework is needed, which is not based on fixed categories such as ownership or media genre and which establishes close connection between media texts and contexts of production and reception. The article therefore foregrounds approaches developed within critical discourse analysis (CDA).

Media, Politics, and the Public Sphere

The post-World War II media order in Western Europe was characterized by a strong public

service broadcasting sector that aimed at reinforcing a unified national public sphere and was therefore protected by broadcasting monopolies. While print media were differentiated according to ideological, class, regional, and language criteria and therefore reached only segments of the national public sphere, the public broadcasting service addressed the nation as a whole. The public service saw itself as a kind of classroom for the nation, which it served, represented and constituted. National broadcasting could create “a sense of unity – and of corresponding boundaries around the nation,” “turn previously exclusive social events into mass experiences,” and “link the national public into the private lives of citizens” (Morley, 2000: 107). Within the public service the state language was seen as a means of strengthening national identities. In the case of multilingual states, such as Switzerland or Belgium, this led to the creation of parallel systems in the respective languages within the national broadcasting order. Imagining the audience as a national community and structuring communication in a unidirectional paternalistic top-down manner also determined language practices that emphasized the cultivation of a ‘pure’ standard language. This became apparent not only in language practices excluding ‘deviant’ accents, but also in ideologically loaded metalinguistic discourses.

Early mainstream theories in media sociology were based on the political philosophy of Enlightenment and viewed the individual as an actor in fulfilling the social contract that grounds civil society. The ideal of media as the fourth realm, as an autonomous controlling institution, which faces the legislative, the executive, and the judiciary, presupposes that there is a relationship of autonomy and distance between the media and the political sector. Such approaches to media and politics tend to conceive media as an omnipotent manipulatory force or to relativize the power of media with respect to politics. In both, communication is conceived as a linear process, in which the transfer of meaning from the sender to the receiver is the central concern. Such approaches fail to locate media, individual actors, and audiences within conflicting fields of interest and power relationships, which are in turn constitutive for the formulation of subject positions (Mattelart, 1999: 94).

Habermas’s discourse-based concept of the public sphere defines public sphere as the mediating institution between society and the state. Media fulfill a dual role; on the one hand they are a commodity depending on the rules of the media and the advertising market; on the other they structure social relationships. In the first phase of the constitution of bourgeois nation states, media contributed to the development of the public sphere, whereas in a later

phase – because of commercialization and the intimate linkage between the state and the economy – they contributed to its erosion. Habermas’s model, originally published in 1962, was based on the assumption of a single unified (national) public sphere. Critics of Habermas’s model were formulated by feminist studies (e.g., Young, 1987) and later also by scholars addressing the question of minority exclusion (e.g., Morley, 2000; Husband, 2001) or language as a factor of such exclusion (Busch, 2004). Habermas (1990) himself revised his model and conceded that he had neglected the existence of counter discourses, counter publics, and counter cultures. Drawing upon Foucault’s notion of discourse, he recognized that the exclusion of the ‘other’ is a constitutive element in the formation of the public sphere and that the formation of dominant discourses is based on mechanisms of exclusion. Nevertheless, suppressed discourses can have a transformative impact on dominant discourses.

Struggle of Discourses

In the 1960s and 1970s, various processes of differentiation transformed the media landscape. All over Europe, media became a central topic on the political agenda. The state monopoly on broadcasting as well as the commercial media trusts that gained power in the concentration process were criticized for excluding a range of social groups and deviant political positions. In other words, social movements claimed an adequate representation within the national media systems. To achieve this aim, social movements largely had to rely on their own media such as posters, leaflets, and alternative print media to express alternative or counter opinions in public.

At the same time, public service broadcasting differentiated its programs according to different styles and tastes. Alongside the nationwide programs, specific regional programs gained in importance. On the political level, regionalization in the media corresponded to a revalorization of regional autonomy and of regional languages. The idea of cultural homogeneity conceived as masculine, white, and monolingual lost in impact, as counter discourses challenged the dominant views and hegemonic social relations.

The main challenge for the public service media stemmed from the pressure of private media enterprises. It was the opposition of public versus private that dominated media policies and finally led to the abolishment of broadcasting monopolies in Western Europe. So-called liberalization first only concerned radio, which had abandoned its function as the leading medium to television already in the 1960s. In commercial media, the information aspect became subordinated to the entertainment component.

Technology-driven media theories, which prioritize aspects of form and format over aspects of content, attribute to the medium as such the leading role in shaping and transmitting a message. This approach became popular with McLuhan's succinct formula "the medium is the message," which marks a break from concepts that ascribe a preeminent power in influencing public opinion to media, both in an educational and in a manipulative way. It neglects, however, the question of how technological developments are appropriated socially and culturally. Discourse-oriented approaches to society and politics as developed by Habermas, Foucault, or Bourdieu have a strong impact on media studies and theories. This shift of perspective emphasizes social relations and cultural factors and allows revealing hegemonies and power relationships. In this sense, media can be seen as sites of discourse struggles.

Fragmentation and Reconfiguration of Media Spaces

In the 1990s, the process of decentering the national public sphere gained in momentum. The availability of satellite and cable TV and later of the Internet has led to a further fragmentation of media audiences, a reconfiguration of media spaces and an increasing multidirectionality of communication flows. Two distinctive developments characterize the new kinds of transnational broadcasting spaces and new transnational configurations of culture: the emergence of global broadcasting regions which link populations of neighboring countries on the basis of proximity, common cultural heritage, language, or ethnic identity, and the creation of new diasporic broadcasting spaces, which gather into a single audience different national communities scattered across the world (Robins, 1997: 15–16). In the broadcasting sector, the media landscape becomes complex and manifold. In addition to the traditional national public service emerge not only the global players, but also a range of local media that themselves tend to have various translocal and transborder connections. While commercial interests are constructing a transnational space as a by-product of their primarily economic motives, nonprofit ventures seek to empower local communities, marginalized populations, and civic activists.

Media formats and genres developed by public service media change in nature. Genres and text categories that used to be separated are blurred, new genres appear (e.g., infotainment, edutainment, reality soaps). Political discourse is not confined to the information genre, but also has its impact in the entertainment sector.

This development in the media field corresponds to a decentering of the nation–state at the political level. Under the pressure of an increasingly globalized economy, the state gradually loses its central role as an organizing principle in society and delegates former core competencies, on the one hand, to institutions and expert committees on a supra-state level, and on the other, to a substate level of regions and communes as well as private bodies or NGOs ('non-governmental organizations'; see Castells, 2003). Neoliberal discourses are replacing the former vision of the welfare state. The deregulation of the media system and the weakening of state influence on the media order potentially provide the media with more space for acting in their own right.

In the current debate on the desideratum of a European public sphere, it becomes obvious that the nation state with its public arena is not withering away yet. At the same time, shortcomings already inherent to the notion of a national public sphere – exclusions and fragmentations – are becoming more accentuated. Husband (2001) draws attention to the necessity of reflecting on possible interfaces between parallel and mutually exclusive public spheres in order to guarantee some social coherence. Whereas political discourse could easily be tied to (national) discourse communities within the nation state paradigm, it seems to be becoming more multilayered now.

Approaches to the Analysis of Political Discourse in the Media

In the academic field, certain assumptions that were taken for granted within the nation–state paradigm are increasingly submitted to revision. In retrospective, media are acknowledged a central role in the formation of the modern nation–state as well as in the standardization and homogenization of national languages. Present media developments seem to also allow more space, however, for nonstandard linguistic practices, for multilinguality and multivoicedness (Busch, 2004).

The present trend in approaches to media texts can be characterized in both disciplines, in media studies as well as in linguistics, by a focus away from text-internal readings, where readers are theorized as decoders of fixed meanings, to more dynamic models, where meanings are negotiated by actively participating readers. Consequently, there is a stronger emphasis on processes of transformation of discourses, on recontextualization, and on intertextuality. Nevertheless, studies that focus on production-related transformations are still scarce. Although since Stuart Hall's (1980) influential model of decoding and encoding, the reader is attributed an active role in the constitution of meanings, studies that combine

the moment of the media text and its reception are not very common.

Rapid changes within the media system and within the political order demand an analytical framework for the study of political discourse in the media that is flexible and sufficiently open. Critical discourse analysis (CDA) provides such a framework, as it combines in an interdisciplinary approach close textual analysis with the analysis of the larger social context as well as with routines of textual production and reception. CDA foregrounds a dual focus in the approach to political discourse in the media: the detailed analysis of communicative events and the order of discourses, i.e., to locate these communicative events “within the fields of social practice and in relation to the social and cultural forces which shape and transform those fields” (Fairclough, 1998: 143). This involves the analysis of texts, of discursive practices of text production, distribution, and consumption, and the analysis of social and cultural practices that frame discourse practices and texts (Fairclough, 1998: 144).

The Field of Politics and of the Media

To capture how the political and the media domain are articulated and how media discourses and political discourses are interlinked, it is useful to draw upon the notion of different fields that characterize modern society as developed by Pierre Bourdieu (1982). According to Bourdieu, the separate fields of the economy, the state, the legal system, the arts, politics or the media, etc. are each marked by their own particular form of institutionalization and by their own social and discursive practices. The political field has undergone significant changes that led to an increasing specialization and professionalization of the involved actors. Political discourse manifests itself among others in parliamentary debates, political meetings, party conferences, and public debates. A certain amount of political discourse is designed from the outset to be reported and represented in the media. This is, for example, the case for parliamentary speeches in which politicians often do not only address the assembly but also a larger general public, as they anticipate mediatization. Referring to the field of politics, Bourdieu suggests that political discourse is doubly determined, on the one hand internally within the field of professional politics and on the other externally, i.e., in relation to the people politicians represent as well as in relation to other fields, the media field being one of them.

The field of journalism and the field of the media are determined by power relations and competition between different media, which become visible

through certain indicators such as the market share, the value on the advertising market, the symbolic capital of prestigious journalists. The importance of the media field in relation to other fields, such as the field of politics, is that it holds a sort of monopoly on the means of production and on large-scale distribution of information. Political discourse and action are subjected to the principle of selection exerted by journalists and the media within the logic of the journalistic field, which is in turn dominated by market competition (Bourdieu, 1996: 45ff). In order to escape possible censorship that results from the selection process in media production, political actors develop strategies of presenting their concerns in forms that are likely to become media events or stories with news value. Political actors adapt their agenda and style to the requirements of media presence (e.g., short statements, studied gestures, hair-style) and of media formats (live debates, talk shows).

Both fields, the political and the journalistic, have in common that they are directly under the influence of the sanctions of the market and of plebiscite. According to Bourdieu (1996: 92), the linkage between the two fields amplifies the tendencies of the agents involved in the political field to act according to pressures exerted by the expectations of a mass public and reduces the autonomy of the political field. In the media field, competition between different media enterprises has become more accentuated in the past few years. Since the fall of the state monopolies, the public service broadcasting cultures have also changed significantly. Even genres that used to be relatively stable such as the national news programs on television have experienced fundamental transformations. For instance, there seems to be an acceleration of pace, a compression of time, in which live-broadcast is given priority over in-depth investigation, and short and diversified news items are combined into a more or less connected rapid succession of news flashes.

From the perspective of CDA, the relationship between the field of politics and the field of media can be understood and analyzed as a chain of recontextualizations. Writing or speaking about any social practice is already an act of recontextualization (Caldas-Coulthard, 2003: 276). Recontextualization can involve suppression and filtering of meaning potentials, but it can also result in expanding meaning potentials by adding or elaborating upon the an earlier version of the text (Chouliarakis and Fairclough, 1999). Van Leeuwen and Wodak (1999: 96) suggest that transformations due to the recontextualization of political discourse include deletion, rearrangement (e.g., changing the order of propositions, altering emphasis), substitution (through linguistic means such as nominalization, metaphor,

metonymy, synecdoche, personalization), and addition (adding new elements to the representation of social practices). In this sense, recontextualization can in turn have a transformative effect on a particular practice or create a new practice.

Linking the fields of politics and media, recontextualization takes place in two directions: media recontextualize political discourse (e.g., speeches) and politicians recontextualize political discourse derived from media (e.g., quoting media as public opinion, as the voice of the common man in the street).

In the process of recontextualization, discourses may also be transposed to a more legitimate context (e.g., from an informal context to the more formal of parliamentary speech) and thus gain in power and status. Legitimation of a text can also be gained through reference to authority, reification, moral evaluation, or through reference to “true stories from real life.” Authority can be gained through reference to law, a person with recognized authority, or an institution. On the other hand, laws in democratic societies often emerge from chains of political discourses in which media have their place (Wodak, 2000).

Analyzing Media Texts

With the rapid and dramatic changes in the media sector, obvious categorizations of media with regards to their area of dissemination (national, local, international, etc.), ownership structures (public service, private), or orientation (information, entertainment, education) are becoming more and more difficult. The formerly propagated separation between information and entertainment/edification can hardly be maintained as new genre names such as infotainment or reality soap suggest. Political discourse does not only appear in news or other information programs, but also in formats formerly reserved to other fields such as talk shows. Pinning down the language of news programs or the language of political media discourse becomes more and more impossible. The following part of this article therefore presents elements for an open and flexible framework for the analysis of (political) discourse in media.

Imagining the Audience

Who is the addressee and how is the relationship with the audience structured? These are central questions in the analysis of media texts. It is in fact the structuring of the producer–audience relationship and the ways in which audiences and their expectations concerning texts are imagined that determine how a text is shaped. Genres and text categories depend on

this aspect. The notion of the target audience, which encompasses a spatial (local, regional, national, global) and/or a social (social status, income, age, gender) dimension is based on rigid and reified audience categories. Research on media coverage and definitions of target audiences are instruments of marketing research and correspond to criteria established by the advertising industry. Ang (1991) demonstrates that this approach is based on a discursive construct of audience that is unable to grasp the actual relationship between media and audiences and to conceive communication processes. She distinguishes between two main orientations: audience-as-public and audience-as-market. The first is generally associated with the public service media sector in which the addressee is seen as a citizen (of a state); the relationship with the audience is paternal and aims at transmitting values, habits, and tastes. It is linked to the so-called transmission model of communication, in which the transmission of a message and the ordered transfer of meaning is the intended consequence of the communication process.

The second configuration of audience is associated with the private commercial media sector. Audiences are addressed as consumers in a double sense: as consumers of the media product and as potential consumers of the products advertised in the programs. In the attention model of communication (McQuail, 1987), communication is considered successful as soon as attention is actually raised in audiences. The transfer of meaning plays a secondary role. The scoop, the extraordinary, and the scandal gain in importance as means of awakening attention.

In the alternative media sector, the conception of the audience is determined by the idea of an active public that participates in social action and media production. The aim is to overcome the division between producers and audiences, to move closer to a situation in which the Other is able to represent itself, in which the heterogeneity of “authentic informants” is not reduced (Atton, 2002: 9). Alternative or third-sector media are consequently closer to the ideal of representing the multivoicedness of society in all three dimensions, which Bakhtin (Todorov, 1984: 56) has described: heterology (*raznorečie*), i.e., the diversity of discourses, heteroglossia (*raznojazyčnie*), i.e., the diversity of language(s), and heterophony (*raznoglosie*), i.e., the diversity of individual voices.

These different basic orientations in conceiving the producer–audience relationship result in preferences for particular media formats (e.g., authoritative information-centered programs, infotainment programs, and dialogic forms such as phone-in programs) and a choice of particular linguistic practices. They also determine the way in which discourses

are being shaped, reproduced and transformed. It has, for example, been observed that the public service sector, at least in some segments of its program, is becoming more market-oriented and that formats and genres developed in a certain sector are taken up – sometimes in a transformed way – by others.

Modalities and Meanings

Media communication is inherently multimodal communication: this means that language in written and spoken form is one of several modes available for expressing a potential of meanings. For instance, in print media lay-out and image are available in addition to the written word; in radio, language is present in its spoken form, alongside music and different sounds; in television all the aforementioned modes can be drawn upon in a context in which the moving image holds a central position. Similarly, in computer-mediated communication, a wide range of modes is available. “A multimodal approach assumes that the message is ‘spread across’ all the modes of communication. If this is so, then each mode is a partial bearer of the overall meaning of the message. All modes, speech and writing included, are then seen as always partial bearers of meaning only. This is a fundamental challenge to hitherto current notions of ‘language’ as a full means of making meaning” (Kress, 2002: 6).

How these modes interact is not only a question of technical availability, but rather a question of social appropriation and convention, as Kress and van Leeuwen (2001) point out in their multimodal social semiotic theory. The interplay between the different modes has undergone substantial changes in media history. Writing was considered in many cultural environments as the central mode for the transfer of canonical knowledge and authoritative discourse. This practice of the predominance of the written text influenced radio production so that practically all radio texts in the early days of the medium were produced first in written form and then read in the radio broadcast. Even in television for some time, news broadcasts were read without a transmission of the image of the speaker, as it was considered that the moving image could distract attention. Linguistic practices and text genres from established media exerted and exert a considerable influence on new media and vice versa. Gradually with television, the image has moved into a central position. This has an impact also on political discourse, where appearances and the visible *mise-en-scène* of political events is becoming more important and must be considered as part of the political discourse. Live broadcasts of TV debates between representatives of different political orientations have for instance become

central events in elections. Computer-mediated communication (e.g., Internet, e-mail) as well as other forms of new communication media (e.g., mobile phone news services) are increasingly present in the political field. The conversationalization of (political) discourse in the media (Fairclough, 1995: 9–10) has already gained in momentum with the image and television; possibly the new media will contribute to accelerating this development.

Text and Context

Media production is regulated by institutional routines, and media reception by everyday practices and arrangements, both depending on available resources. The production of media texts can be seen as a series of transformations, a chain of communicative events that link sources in the public domain to the private domain of media reception (Fairclough, 1995: 48–49).

Media production also encompasses the collection and selection of raw material. At each stage in media production, earlier versions of the text are transformed and recontextualized in ways that correspond to the priorities and goals of the current stage. In a multimodal context, different modes can become separated; for example, images can be subtitled with other texts or associated with other contexts.

During the production process, journalists can revert to different kinds of source material: political speeches, interviews, items already preprocessed by news agencies, press releases, archives, other media texts, etc. Current transformations in media production can be characterized on the one hand by an increasing specialization of journalists on narrower fields of reporting (specialization on topics, geographical areas, etc.) and on the other hand by a decreasing labor division between technical and journalistic parts of production. The journalist is not only responsible for the text, but also for the lay-out, the selection of images and even parts of the technical production. Replacing the typesetter, the reader and/or the sound technician, the journalist becomes the designer of a multimodal text. At the same time, because of the economic imperative of reducing the fixed costs in media enterprises, the amount of genuine journalistic investigation decreases in favor of ready-made products such as news agency material and preproduced elements and formats. Journalistic work is becoming more and more a matter of selection than of investigation and news production. This process is encouraged by an oligopolistic owner structure and practices of cross-referencing between different media. In relation to political discourse, this means that certain topics

can make sometimes even unexpected media careers and become dominant in certain media areas (Siegert, 2003).

Another aspect frequently referred to in the context of media and political discourse is the acceleration of the rhythm of news production, especially with the rise of electronic media, which has in turn an accelerating influence the political agenda. That the political field responds to rhythms of urgencies was already raised by Platon, who drew attention to the differences between the actors in the *agora*, the public space, the political arena and philosophers who obey other rhythms. No doubt political and media agendas and discourses influence each other in multiple ways. Whereas earlier theories assumed a predominance of politics over the media or vice versa, contemporary approaches foreground interdependencies and interactions between the political and the media fields.

Media: Pragmatics

K C Schrøder, Roskilde University, Roskilde, Denmark

© 2006 Elsevier Ltd. All rights reserved.

Today, many, if not most, people in the world live in societies that can be described as ‘mediatized societies.’ A mediatized society is one in which the meaning processes, or discourses, provided by the communication media play an increasing, even overwhelming, role in the way society is economically, politically, and culturally organized, affecting the way we as individuals and groups think about everything and thus what we do in all contexts of life.

The mediatized society affects us in whatever social roles we have to fill in everyday life. As citizens, we are concerned about the organization and power relations of society; as consumers, we have to take care of our material, intellectual, and wider cultural needs; and as human beings, we have to organize our private lives as individuals, couples, or families on a daily, weekly, and yearly basis.

In all these respects, we are surrounded and affected by the sea of discursive meanings produced by the media. It is therefore mandatory for the understanding of modern society to understand the complex social meaning processes that have media at their core. This requires a ‘pragmatics of media’ that explores media discourses in their situational and social contexts.

Approaches to the Study of Media Discourses

It has gradually become accepted, at least in principle, that in order to understand the workings of the mediatized society it is necessary to adopt a holistic perspective of the media, according to which it is necessary to not just analyze the media texts but also to consider the production and reception processes involved in media texts, as well as the macro-social context, as interdependent objects of empirical analysis. For a number of years, these processes were conceptualized theoretically in semiotic terms as a signifying process, along the lines laid down by the so-called ‘encoding/decoding’ model of mass communication (Hall, 1980) (Figure 1).

This model implies that any study of a media genre or of the media coverage of real-world events must research, in addition to the textual aspects, the production and reception stages around the text. The model serves to remind analysts that in analyzing a text, they are dealing not with a fixed structure of meaning, but with a volatile phenomenon resulting from the signifying codes of both the producers and

the recipients of the text. Crucially, these codes need not be identical; indeed, since the codes at the disposal of any individual consist of a unique assemblage of the meanings assimilated during that person’s life history, the codes of producers and receivers are in principle nonidentical. Consequently, one should expect to find multiple meanings resulting from different individuals’ reading of a news bulletin, an advertisement, or a TV reality show.

On the other hand, people also belong to interpretive communities (constituted by such factors as class, ethnicity, gender, age, profession, location, etc.) in which meanings are shared to a large extent (Schrøder, 1994). Therefore, a purely textual analysis of a media text can still be justified, as long as the analytical findings are offered cautiously as potential meanings, or made on behalf of a specific interpretive community whose sign universe makes these meanings plausible.

In recent years, the term ‘discourse analysis’ has gained general acceptance as the way to characterize the theoretical and methodological framework, often holistic, within which analyses of media language and communication are carried out in the interdisciplinary field of media studies, cultural studies, and communication studies. For a general introduction to the most prominent distinctive approaches to discourse analysis in the social sciences and the humanities, see Jørgensen and Phillips (2002).

First-Generation Discourse Analysis: ‘Critical Linguistics’

Critical linguistics developed in the 1970s as an influential school of early discourse analysis because it was able to demonstrate the close relationship between the detailed linguistic choices and the production of ideology in media texts (especially news) and, by implication, to explain how media ideology contributed to the reproduction of a social order characterized by inequality and oppression (Fowler *et al.*, 1979).

Critical linguistics adheres to an early version of linguistic constructionism, according to which the words of our language function as a conventionalized mental grid through which we perceive reality. Words constitute the reality that they designate, and when newspapers inform about social states and events they inevitably construct those very states and events.

Going one step further, critical linguistics claims that also the syntactic choices made in a text have a constraining effect on the construction of social reality. The most important of such syntactic-ideological processes are those of passivization and nominalization.

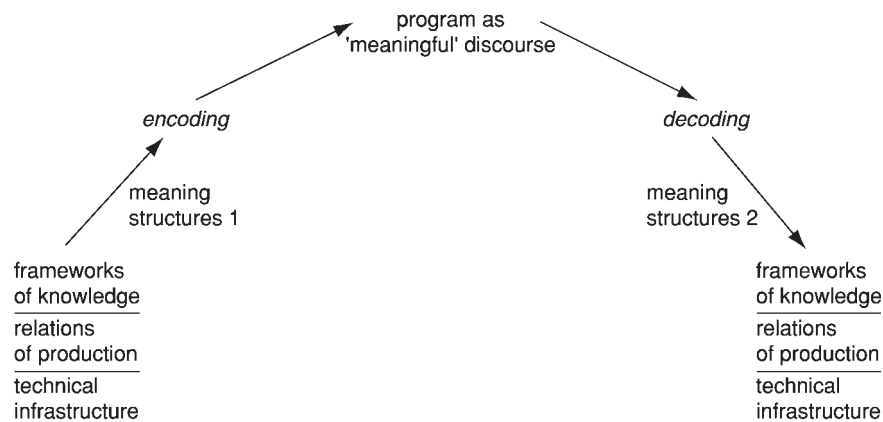

Figure 1 The encoding/decoding model. Reproduced from Hall S (1980). 'Encoding/decoding' In Hall S, Hobson D, Lowe A & Willis P (eds.) *Culture, media, language*. London: Hutchinson.

This should not be taken to mean that the verbal choices in news reports can be made by journalists at will. As mentioned previously, the formation of public opinion through the media in capitalist societies is controlled by those with economic and social power over the mass media, who will see to it that social affairs are represented in such a manner as to not jeopardize their interests and privileges. Consequently, there is a power dimension in all public communication, an ideological thrust that by its sheer omnipresence in the aggregate media landscape manages to establish the current social arrangements as natural and inevitable and to discredit alternative perspectives as being contrary to common sense.

It is the task of critical linguists to expose the ideology conveyed by the media, to demonstrate that news reports of social affairs are indeed constructed and that they systematically portray a state of affairs that is not in the best interest of the majority of the population.

It is thus the goal of detailed linguistic analysis to demonstrate how various seemingly innocent linguistic features in a text convey ideological meanings that reproduce existing unequal power relations. Through linguistic analysis of the news text, the critical linguist is able to expose "warped versions of reality" (Fowler, 1985: 68).

Drawing on Halliday's (1978) theory of functional grammar and social semiotic, innumerable publications by the core group of critical linguists through the late 1970s and the 1980s have described the specific linguistic features that "will probably repay close examination" (Fowler, 1985: 68; see Fowler *et al.*, 1979; Hodge and Kress, 1988). The 'checklist' presented in Fowler (1985) includes the following:

1. Lexical processes: Under this heading, critical linguists examine the way a text uses different lexical fields through the choice of vocabulary (including

metaphors) from specific areas of experience, such as scientific vocabulary in a cosmetics ad or management jargon in a political text.

2. Transitivity designates the textual construction of reality through the description of participants and processes, as reflected in the nouns and verbs of the text. As Fowler (1985: 70) states, "Different choices of transitivity structure will add up to different worldviews."
3. Syntactic transformations: Critical linguists believe that certain syntactic transformations of sentences, particularly those labeled 'passivization' and 'nominalization,' are ideologically problematic because they may make agency invisible and thereby obscure who did what to whom or significantly change the relative prominence of the participants.
4. Modality: Under this heading, analysts search for the different linguistic features (e.g., modal verbs and adverbs) through which speakers and writers may express their attitudes toward the events depicted by the sentences in which they occur.
5. Speech acts and turn-taking: Analysts should consider for each sentence or utterance what speech act it appears to perform and how it may build positions of power in the situation in which it is written or spoken. The analyst may also produce interesting insights about the power aspect of interpersonal interaction by examining the turn-taking patterns of different kinds of dialogic and discussion-oriented TV programs: who can speak when and about what, who can open up new topics, etc.
6. Implicature: This linguistic feature is best explained as the meaning that can be found by 'reading between the lines.' There is more to meaning than what is said, and an essential part of the meaning communicated through language is inferred by the speakers from the situational and social context.

7. Address and personal reference: Under this heading, the analyst may consider how different stylistic choices can be seen as addressing some readers rather than others (such as a Latinate vocabulary addressing the educated), how naming conventions affect the degree of formality, and how personal pronouns (*you* used with simultaneous individual and mass appeal in ads, and *we* used to include or exclude listeners from the group the speaker belongs to) may affect interpersonal relationships.

This checklist of potentially ideology-bearing features developed by 'critical linguistics' has found its way into many later forms of qualitative textual analysis of the media, including the approaches to discourse analysis discussed later.

It is not evident, however, that they are all equally useful for the production of insights about the media's signifying processes. For instance, transitivity analysis requires an immensely time-consuming scrutiny of textual details, and even when a kind of ideological pattern does emerge from the analysis (see the case analyzed in Fowler, 1985), it is usually a fairly predictable one that even a cursory glance at the text would have discovered. Therefore, especially for students with little linguistic training, transitivity analysis is usually not worth the effort.

Regarding the 'syntactic transformations' of nominalization and passivization, it is doubtful whether the claims of their mystifying effects are really warranted. In most cases, they appear to be based on erroneous assumptions about the 'nonrecoverability' of the transformed or deleted linguistic items (Trew, 1979). It seems to be equally probable that on the basis of their overall knowledge of the world, their familiarity with the media agenda and yesterday's news reports, and their general communicative competence, average newsreaders will have no difficulty in reconstructing who did what to whom, despite the agent having been deleted from the sentence through a passive construction. Interestingly, an empirical study of readers' reception of newspaper articles previously analyzed by Trew found that the syntactically constructed ideology of the articles did not determine the readers' views of the events reported. Their views depended on their identities and life histories as much as on an ideological effect attributable to the news language (Sigman and Fry, 1985).

Critical Discourse Analysis of the Media

Although clearly intellectually rooted in critical linguistics, critical discourse analysis (CDA), as developed by Norman Fairclough and others since the late

1980s, represents a significant theoretical and methodological advance toward the interdisciplinary study of media discourse (Fairclough, 1995, 2003; van Dijk, 2001; Wodak and Reisigl, 2001). Rather than concerning itself just with the media's textual reproduction of ideology, CDA sets up a comprehensive theoretical framework that relates textual features systematically to the situations in which those texts are produced and consumed and to the larger social processes of the society in question.

This theoretical framework is often described through a model of three embedded boxes (Figure 2), each of which represents a dimension of analysis (Fairclough, 1995: 59).

'Texts' stand at the core of the model and are explored through the same forms of linguistic analysis that are used by critical linguistics, with the purpose of illuminating the way the text represents social reality and the way it portrays the identities and relations of the participants in the textual universe.

The second dimension of analysis deals with 'discourse practices' – that is, the processes through which the media text is produced in media institutions and consumed, or 'decoded,' by the audiences and users in the context of everyday life. The discourse practices are seen as mediators between texts and macrolevel 'sociocultural practices,' which constitute the third dimension of analysis. On this level, the phenomena brought to light by the other two dimensions are viewed in relation to the macro-social processes that characterize the societal 'order of discourse' at a given point in time (see **Discourse, Foucauldian Approach**).

CDA, in contrast to critical linguistics, is founded on an acute awareness of the ambivalent role of media discourses in the social formation. Inscribing his model into the current debates about 'structure' versus 'agency' (Beck *et al.*, 1994; Giddens, 1984),

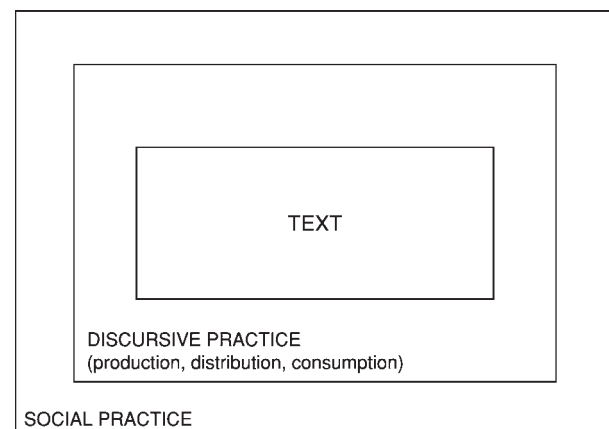

Figure 2 Dimensions of analysis in CDA. Reproduced with permission from Fairclough (1995).

Fairclough placed his approach within a social constructionist theory of society according to which media discourses are constituted by social practices and also are constitutive of such practices.

This means that, on the one hand, mainstream media discourses are constrained, by the economic and political frameworks within which they operate, to produce versions of reality that are on the whole supportive of the existing social order. On the other hand, the fact that the existing social order is not monolithic but characterized by diversity and ideological struggle means that the faithful representation of this very reality must also be characterized by diversity and struggle, and the outcome of such representational struggles is by no means certain to always favor the power elites. The end result of the media's discursive practices in a given area is therefore often uneasily balanced between social reproduction and social change, between convention and innovation.

For example, the macrosocial phenomenon that Fairclough terms the 'conversationalization' of public discourse in the media (i.e., the increasing occurrence of informal speech forms and colloquial expressions in television news and documentary programs) can be seen as sometimes working to support ideologically hegemonic forces because it may trivialize and simplify complex social relationships. However, conversationalization may also serve as a generator of cultural democratization because it may make complex issues easier to understand: "The communicative style of broadcasting lies at the intersection of ... democratizing, legitimizing, and marketing pressures, and its ambivalence follows from that" (Fairclough, 1995: 149).

'Intertextuality' is a key analytical concept in CDA designating a principle of textual construction and recognition encompassing several distinct processes. It is meant to cover the basic fact that any text is indebted to innumerable previous source texts and will itself potentially become a source for an infinite number of future texts. Intertextuality also includes the way a text may stylistically echo one or more well-established genres, or particular well-known texts (e.g., when a TV commercial echoes the Western genre or a specific Western film), as well as the way a text may use specific recognizable passages from other texts (e.g., when a U.S. presidential hopeful inserts into his speech a passage from the Declaration of Independence or the Bible, or when news stories rely on direct or indirect quotations of a politician's statements).

Finally, the intertextual perspective means that the analyst should search for the way the particular text may draw on different 'orders of discourse.' This is a term that Fairclough borrowed from Foucault and

that he defined as "a structured configuration of genres and discourses ... associated with a given social domain" (Fairclough, 1998: 145) with clear implications for the regime of knowledge and power that rules within the particular domain. In the case of political discourse in the media, one may find that the conventional political order of discourse is intermingled with scientific and technological orders of discourse, the order of discourse of grassroots politics, the everyday order of discourse, etc. to create a new hybrid superordinate order of discourse that may herald innovative processes in the political domain.

The main limitation of CDA, which in no way invalidates its achievement as a stimulating theoretical framework for media analysis, is the lack of empirical consideration of the middle level of analysis, the discourse practices. Fairclough deliberately excludes this aspect from his own analyses, stating that "my emphasis will be upon linguistic analysis of texts... I am not concerned ... with direct analysis of production or consumption of texts" (Fairclough, 1995: 62). It is nevertheless a limitation that becomes acute if the analyst wants to discuss the sociocultural implications for audiences of the meanings found through textual analysis. Very few researchers have undertaken a fully holistic, empirical study of media discourses examining the text-mediated communicative circuit between senders and recipients. Among the exceptions are Swales and Rogers's (1995) study of corporate mission statements and the studies of the news circuit by Gavin (1998) and Deacon *et al.* (1999).

Conversation Analysis and Discursive Psychology

A third important discourse analytical approach has been developed mainly by scholars in the field of discursive psychology (Potter and Wetherell, 1987). Among its heterogeneous ancestry, there is no doubt that the ethnomethodology/conversation analysis complex has had the most formative influence on the approach with regard to the actual procedures of analysis. It is the analytical aim of conversation analysis to explore the situational micromechanics of verbal interaction, illuminating among other things the speakers' management of turn-taking processes through adjacency pairs, the role played by silences and interruptions in the flow of interaction, the way speakers manage topic development and topic change, mechanisms for 'opening up closings,' and so on (for general introductions to conversation analysis, see Nofsinger (1991) or Have (1999)).

Like conversation analysis, discursive psychology takes its point of departure in the situational context

in which language is used. However, it does so in order to explore how the micromechanics of verbal interaction affect wider cultural, political, and social processes, for instance, in the analysis of nationalism in institutional and everyday settings (Billig, 1995, chap. 5), and in order to reconceptualize the study within psychology and social psychology of topics such as attitudes, memory, and attribution (Potter and Wetherell, 1987).

The study of the mass media is not central to discourse psychology proper. However, it is clear that the approach has a lot to offer theoretically and analytically in this respect as the electronic media become increasingly dominated by programs that borrow from or replicate the verbal interaction of everyday life and as the digital interactive media open up enticing prospects of virtual communities based on verbal exchange (Hutchby, 2001) (*see Cognitive Technology*).

Briefly characterized, discourse psychology analyzes talk in everyday situations because it is in interpersonal encounters that an important part of social reality is constructed, as speakers position themselves and each other in situational roles according to their individual and social interests. Discourse psychology is particularly concerned with the way speakers engage in fact construction – that is, the way they attempt to establish their accounts, or ‘versions,’ of social events as true and factual and to undermine the factuality and truth of the versions of their interlocutors – a focus that is particularly appropriate to investigate many television news interviews and studio debate programs (Potter, 1996).

When they produce their accounts of social events, staking a claim for their version, participants are drawing on meaning resources based on interpretive repertoires, a kind of ‘framework of understanding’ (Potter and Wetherell, 1996: 89):

By interpretative repertoires we mean broadly discernible clusters of terms, descriptions, and figures of speech often assembled around metaphors or vivid images. In more structuralist language we can talk of these things as systems of signification and as the building blocks used for manufacturing versions of actions, self, and social structures in talk.

In a study of the discursive construction of politics in Danish media, Phillips and Schrøder (2004) found that the media made sense of the political through six different interpretative repertoires for understanding politics in a wide sense, ranging from the parliamentary arena, through the subpolitical arena of grassroots activism, to the life-political arena of political consumption in daily life: 1. ‘parliament-at-work,’ offering a positive perspective on capable and active

politicians; 2. ‘the dirty underside of the party game,’ in which politicians are seen as scheming and manipulative; 3. ‘populism,’ pitching sensible citizens against distant, ignorant, and arrogant politicians representing ‘the system’; 4. ‘grassroots activism,’ in which citizens can make a difference by joining forces around single issues; 5. ‘everyday politics,’ where the negotiation of individual responsibility for social issues results in small-scale political action; and 6. ‘politics as a meta-phenomenon,’ an interpretive repertoire that constructs an outside evaluative and reflective perspective on the mechanics and limits of political institutions and agents.

The important point about such repertoires is that they are not mutually exclusive but may coexist in a particular media discourse about politics, serving different rhetorical purposes in different situational circumstances. Also, they should be seen not just as contributing to the formation of citizens’ personal ‘attitudes’ about politics but also as generative meaning practices, which result in different conceptualizations of the possibilities and limits of political action.

As already mentioned, discourse psychology takes no particular interest in the media. However, Potter’s comprehensive analysis of the situational construction of facticity is full of examples from media discourses, as he demonstrates how speakers in news programs take great pains verbally to demonstrate that they do not ‘have an axe to grind,’ to voluntarily confess to having a stake in some state of affairs in order to create an impression of honesty and trustworthiness despite their stake, to claim that “facts show that . . .” something is the case, to bolster credibility by adducing the testimony of sources whose identity may be difficult to establish (e.g., when news reports draw on so-called ‘community sources’ for their reporting of city gang warfare), and so on.

The most interesting and systematic work on media discourses from a situational perspective of dynamic interpersonal negotiation, however, has come from scholars who view themselves as conversation analysts rather than discourse psychologists (Clayman and Heritage, 2002; Greatbatch, 1998; Heritage and Greatbatch, 1991). One growing body of work has analyzed the most interactive genre of news production, the news interview (*see Conversation Analysis*).

In such studies, there is not much interest in the possible ideological meanings of the sequence of utterances. Attention is focused on the interactive dynamics of the interview exchanges as their turn-taking patterns are compared with those of ordinary everyday conversation in order to illuminate the specific constraints and options that govern the

situational production of such interviews within the framework of public service broadcasting.

Noting that news interviews deviate systematically from ordinary conversation in replacing the latter's question-answer-receipt pattern with a question-answer-question sequence, Heritage (1985) explained this difference by the fact that news interviews are produced for an overhearing audience. By avoiding the evaluation inherent in the third-turn 'receipt'-response characteristic of normal conversation, the interviewer declines the role of evaluating answer recipient while maintaining the neutral role of answer elicitor.

The importance of the overhearing audience also manifests itself in the frequent occurrence of so-called 'formulating' utterances, in which an interviewer (by saying to the interviewee, "So you're suggesting that ...") may make explicit the potentially controversial implications of a politician's answer while merely appearing to rephrase what the interviewee just said. Formulations may thus also serve an important function within the institutional framework of public service broadcasting, which requires journalists to maintain impartiality and balance in the coverage of controversial matters.

A completely different type of TV interaction for an overhearing audience is analyzed by Crow (1986), who explores the conversational pragmatics of a U.S. phone-in program in which a sexologist host gives advice about sexual problems, a genre that falls between private interpersonal talk and talk explicitly designed for an overhearing audience. Montgomery (1986) offers an excellent example of the analysis of broadcast monologue as he demonstrates how radio DJ talk, in contrast to third-person-based radio news monologue, operates on the axis between first and second person pronominal address. The DJ constructs an imagined community with his or her listeners in a simulated half-dialogue in which he or she does not display the slightest sign of awkwardness that his or her initiating speech acts (e.g., greetings and questions) are not responded to by anybody. Scannell (1991) presented a diverse range of studies on different types of conversational interaction in the broadcast media.

Analyzing the Visual Aspects of Media Discourse

The visual aspects of modern media discourses have presented a difficult challenge for analysts of mediated meaning processes for many years. It is characteristic of discourse analytical approaches that they are almost exclusively focused on media

language, whereas the visual dimensions of news reports in print and electronic media are at best given secondary attention.

This situation exists despite the fact that it has long since become conventional wisdom for media research that the media landscape is increasingly dominated by still and moving pictures, which carry a substantial part of the total meaning communicated in newspapers and magazines, on television, and in the new media.

When visual analysis of media pictures is attempted, the analytical tools always derive from the same two sources: Roland Barthes's operationalization of the linguistic concepts of denotation and connotation for the analysis of images, especially photographs, and semiotician Charles S. Peirce's concepts of iconic, indexical, and symbolic signs (for a detailed analysis of news photographs, see Hall (1973) and Fiske (1990).

Barthes (1964) suggested that we distinguish between two orders of meaning in a photograph: the denotative level, which carries the innocent, factual meanings available to any observer irrespective of cultural background, and the connotative level, which carries the visual meanings that a specific culture assigns to the denotative message.

Barthes's original example presented an advertisement that denotatively pictures a string shopping bag in which one can see some onions, a green pepper, a can of tomato sauce, and two packets of pasta; the colors are yellow and green on a red background. In the French context of Barthes's analysis, this visual message acquires the cultural meaning (connotation) of 'Italianicity,' and as a selling proposition the ad offers not just a number of unrelated products but the whole atmosphere associated with Italian cuisine. In similar fashion, other ads may offer visually based connotations such as sexuality, family happiness, scientific progress, and historical authenticity. According to Barthes, these connotative meanings will appear to the consumer as naturally given, not as ideological constructs, because they are 'grafted' onto the underlying, innocent denotative meaning. In this way, advertisers and other message senders may use connotations to convey taken-for-granted meanings that are shared within a culture without making these (ideological) meanings available for critical scrutiny.

The analytical terms borrowed from Peircean semiotics have to do with the relations between signs and the real-world objects to which they refer (Peirce, 1985). Whereas a 'symbol' is a sign whose connection with its object is purely a matter of convention (the linguistic 'word' being the obvious example), an 'icon' is a sign that is related to its referent through

similarity; thus, a photograph in a news article or in an advertisement is an iconic sign of the real-world phenomenon it represents. An 'index' is a sign that signifies by existential or physical connection with its object, such as when a product advertised in a magazine ad is made visually contiguous to the paraphernalia of a desirable lifestyle, whose qualities may thereby become associated with the product.

It should be stressed that the three Peircean concepts are not to be thought of as three different kinds of sign but, rather, as three dimensions that are inherent properties of all signs in relation to their referents. A media picture of the White House is thus simultaneously an iconic representation of a particular building located in Washington, DC; an indexical representation of the government of the United States since it houses and thereby stands for its primary executive officer; and a symbolic representation of the connotative values conventionally associated with the United States and its president, be they those of the coercive global policeman or the home of freedom and democracy.

It is especially the indexical/metonymical aspects of visual signs that may carry powerful ideological implications because they seem to establish a natural connection between the sign and its referent, between the 'part' that is selected by the photographer or editor for visual representation in the news photo and the 'whole' scene that the photo supposedly represents. Thus, a metonymic photograph of a single violent incident may convey a wrong impression of a demonstration that was otherwise peaceful and orderly (*see Pragmatic Indexing*).

These semiotic tools have proved to be of considerable heuristic value for the analysis of media images, but it must be acknowledged that they have been unable to provide insights beyond the commonsensical. Moreover, the distinction between denotation and connotation is theoretically dubious because it is impossible within the terms of the theory to define precisely the threshold between noncultural and culturally invested meaning on which the distinction relies (Eco, 1968). Some attempts have been made in recent years to change these theoretical terms by drawing on a cognitive approach to visual perception, according to which there is no fundamental difference between the perceptual processes of making sense of real-world and pictorial visual stimuli. The first-order visual media meanings are naturally perceived by the visual sense and then enter into a process of cultural investment and interpretation according to conventionalized signifying processes (Messaris, 1997).

The challenge of developing an innovative approach to the analysis of visual discourse has been taken up by scholars who wish to take discourse

analysis much further than merely extending its field of operation from linguistic to also include visual signs. They suggest that the modern media from school textbooks to the World Wide Web are increasingly producing texts that are multimodal, making use of a range of representational and communicational modes within the limits of one text (Kress and van Leeuwen, 2001).

The range of the different 'modes' of communication includes, in addition to verbal language, the visual (including graphic styles, spatial display, diagrams, pictures from line drawings, and still and moving photos), the gestural, sound, etc. and requires the building of a comprehensive 'discourse semiotic' in which all kinds of human semiosis are explored within the terms of one theoretical platform (Kress *et al.*, 1997: 258):

Discourse analysis has, on the whole, focused on the linguistically realized text. In the multimodal approach the attempt is to understand all the representational modes which are in play in the text, in the same degree of detail and with the same methodological precision as discourse analysis is able to do with linguistic text.

The overall theoretical framework of Kress and van Leeuwen's visual discourse semiotics is strongly akin to Fairclough's three-dimensional model, whereas the analytical practice is inspired eclectically by theoretical and analytical work in linguistics, visual semiotics, film theory, art criticism, as well as numerous predecessors in the various fields of media research, especially the analysis of advertising (Cook, 1992; Myers, 1994; Williamson, 1978).

At this stage, however, it is not evident that the multimodal approach represents the kind of genuine innovation of the analysis of visual media discourses claimed by the authors. First, irrespective of the authors' protestations to the contrary, with its indebtedness to Halliday's (1978) theory of social semiotics, the approach is based on and to some extent biased toward a linguistic conceptualization of the other modes of representation. Moreover, both some of its theoretical ground pillars and some of the analytical insights balance somewhat uneasily between the postulational and the commonsensical, and the analytical conclusions sometimes lapse into a simplistic view of the transfer of ideology from verbal-visual text to reader.

Toward a Pragmatics of Media

This article has argued that a holistic theoretical perspective is necessary to understand the way the media communicate with citizens and consumers living in a mediatized world. One consequence of the adoption of a holistic, discourse-analytical perspective on the

media is that in addition to focusing the analytical spotlight on the textual meaning processes in the media, the analyst is also invited to explore the discursive practices through which media texts are produced and received, as well as the larger sociocultural framework within which these processes take place. This requires the analyst to supplement traditional forms of critical analysis of media texts with ethnography-inspired interview-based fieldwork of, for instance, journalistic production routines and audience reception processes.

Such discourse–ethnographic work produces new textual objects of analysis in the form of qualitative interviews with media producers and audience members about the meaning processes they engage in around the media product (Lindlof, 1995). Clearly, this research agenda is no less imbued with theoretical and methodological hazards than that of traditional media language analysis, which may explain the reluctance of media discourse analysts to embark on the kind of ethnographic fieldwork that they readily acknowledge is necessary. However, the payoff in terms of explanatory power is evident in those few instances in which scholars have faced the holistic challenge and brought together insights from production, textual, and reception studies of mediated communication (Deacon *et al.*, 1999).

The Information Society and the Changing Status of Experts

Fifty years ago, authorities were generally more clearly defined in society than they are today. Teachers, doctors, and lawyers had undisputed expert status and as such they were highly respected and their authority was rarely questioned by the average citizen. Academic training was the exception rather than the rule and a much larger number of people were employed within the agricultural sector or within other manual sectors following a very limited period of schooling. Being practical, skillful, and able to manage were important values, whereas intellectualism, theoretical discussions, and criticism of society were not the order of the day. To a large degree, knowledge was still passed on from your elders and gained by experience. Although not academically trained, most people (men) were skilled in something often through some form of apprenticeship and areas of expertise were generally acknowledged.

Gradually, this has changed. In the 1960s, academics started challenging the authorities and their

status as omniscient. They demanded the right to have a say (not only within their own fields) and this demand required information. From the 1960s on, the number of people receiving academic training has exploded. Jobs that just a few decades ago required very little schooling cannot be had without years at college. Written material is distributed like never before, the various media provide a constant stream of information and the advent of the computer and the Internet in particular has catapulted us into the era of the information society. Many citizens and consumers today consider information their right in a democratic society, but there is also another side to the coin. Apart from the self-assured, critical, and challenging citizen, there are still many people who find it difficult to digest even fairly simple texts and who are not used to asserting themselves publicly. This group of people is at a disadvantage in the self-service information society. Authorities have been able to lower their level of personal service and have become used to handing out brochures and referring people to web pages. Furthermore, within some areas the reason for publishing huge amounts of information is not a true desire to convey information but, rather, a way to limit responsibility. That is why, for example, patient package leaflets contain long lists of extremely unlikely side effects, a measure that prevents the medical company from being taken to court on a 'should-have-told' basis.

The New Roles of Medical Experts

Society is now at a stage at which it is possible to obtain information about almost anything within a very short period of time. This has changed the way in which experts and authorities are perceived. Now that there is easy access to so much information it has become possible, and quite common, to criticize and challenge the views and decisions of experts. Within the field of medicine this has led to new roles for medical professionals and the entire medical industry (it should be noted that the contents of this section first and foremost apply to the industrialized world).

To a large degree, the medical profession is still highly respected and much authority still surrounds the health-care practitioner. Nevertheless, many patients do not accept a diagnosis as readily as they used to, they seek second opinions, read up on the matter themselves, and suggest alternatives, etc. Once they are convinced the diagnosis is right they do not always accept the treatment proposed by the doctor; they may challenge his/her views by means of the latest research available on the Internet and they may seek alternative treatment. Patients want access to their files to check what is going on. The medical industry is being met with claims of openness and information about the medicine they produce. Patients want to know about possible side effects (and to have them graded statistically) in order to decide whether to take the medicine prescribed or not. Medical experts no longer just diagnose and prescribe; they are expected to be willing and able to inform and discuss with the patient to a degree never seen before. Generally speaking, patients are more literate than ever and used to seeking and digesting new information. But even the most well-educated part of populations do, however, not possess the background knowledge of a medical expert and are linguistically speaking not part of the discourse community of medical experts. There is no doubt that patients who are used to digesting complex texts will often benefit from the information they obtain. However, many people do not possess this ability and this is problematic, because in today's society they are expected to. In earlier days, the doctor assumed complete responsibility; on the one hand, this meant that the patient was left to the mercy or competence of the individual doctor; on the other hand, it meant that the patient could leave things in the hands of fate and the doctor and did not have to carry the burden of having to be informed and being able to make informed decisions. But in the 21st century, authorities expect people to understand the technical and semitechnical language of doctors, various health

campaigns on prevention and warning signals, the contents of patient package inserts (also in connection with the increasing amount of medicine sold over the counter, i.e., without any consultation), a number of informative brochures on specific ailments, their own medical files, and so on. This may be quite feasible to part of the population, but is likely to be problematic to many people.

What Is Medical Language?

Medical language is traditionally regarded as the language used by medical experts when communicating in an expert-to-expert context. It is the language of the 'specialist,' often defined as a special language as opposed to general language used by the general public in everyday situations:

Special languages are semi-autonomous, complex semi-otic systems based on and derived from general language: their use presupposes special education and is restricted to communication among specialists in the same or closely related fields. Sager *et al.* (1980: 69)

Those who master medical language have been encultured or socialized into the language. The student of medicine automatically becomes a student of medical language when attending university to become a health-care practitioner. Thus, apart from acquiring knowledge about the medical field, s/he learns to communicate with peers using the linguistic tools appropriate in the medical context. It is a process in which books, medical journals, traineeships at hospitals, conversations with lecturers, fellow-students, doctors, etc. contribute to a gradual buildup of a specialist, medical language. When the student graduates, s/he not only possesses thorough *knowledge* of the medical field, s/he also masters the *language* of the medical discourse community.

Characteristics of Medical Language

The most obvious characteristic of medical language is its extensive use of words related to the subject matter – also referred to as 'medical jargon.' Apart from the medical jargon, medical communicators also favor a passive and impersonal style that focuses on objective, measurable phenomena rather than concrete actions. This style is attained through the use of heavy noun phrases (with nominalized actions), passive clauses, and a preference for third-person pronouns rather than first personal pronouns.

The medical jargon and the passive and impersonal style allow experts to provide precise and condensed information for other experts who are trained to perceive and consequently talk about the physical world in a rational, objective, and measurable way.

An example could be the pharmacist describing the attributes of a medicinal product in the so-called product summary – which is an official document from the pharmaceutical company that provides approving authorities with information about a particular product in order for them to authorize the marketing of the product. It gives health-care practitioners detailed information about a medicinal product as in the following extract:

The antidepressant, antiobsessive-compulsive and anti-bulimic actions of fluoxetine are presumed to be linked to its inhibition of CNS neuronal uptake of serotonin. Studies at clinically relevant doses in man have demonstrated that fluoxetine blocks the uptake of serotonin into human platelets. Studies in animals also suggest that fluoxetine is a much more potent uptake inhibitor of serotonin than of norepinephrine. (<http://pharma-help.com>)

This example is used within a medical discourse community that is ‘pure,’ in the sense that the community is composed of equals or near-equals in knowledge and professional role (pharmacist to doctor). However, medical genres and medical discourse are not necessarily restricted to that of experts talking to experts. As patients, consumers, and members of society in general, nonspecialists momentarily enter the medical discourse community – not as producers but as *consumers* of medical texts such as patient package inserts for medicinal products, social marketing leaflets explaining the dangers of smoking, or when consulting GPs or pharmacists. Therefore, medical language is not restricted to the discourse community of experts but can also be found in communities in which the addresser is a professional and the addressee is a layperson.

The need for medical information accessible to people outside the professional medical domain has brought about a significant change in the premises of medical communication. The traditional symmetrical communication between equals (e.g., pharmacist to doctor) has been challenged by the demand for *asymmetrical* communication between experts and laypeople (e.g., doctors to consumers). This demand calls for recognition of a medical language at *different levels of abstraction*. If both communicators are specialists, the highest level of abstraction (i.e., ‘traditional’ medical language) is the obvious choice. If the communication is asymmetrical (professional-lay), the medical subject matter has to be adjusted to the knowledge of laypeople. In practice, this means that texts, which originate from an expert discourse community but serve as the basis for a consumer-oriented version, need to be ‘translated’ to become meaningful to nonexpert readers.

What Is Professional-Lay Medical Language?

This section deals with written communication though many features apply to oral communication as well.

Target Group

In 1859, Kierkegaard wrote about the following situations in which experts, or people who know more than others, want to convey their knowledge to other people:

If I am to succeed in guiding another human being towards a certain goal, I have to find the place where he is and start right there [...]. In order to help somebody, I certainly have to understand more than he does, but first and foremost understand what he understands. (our translation of Kierkegaard, 1869, in Becker Jensen, 2001: 18)

Kierkegaard tells us that if you do not have this understanding it is no help that you are more knowledgeable than your target group, and he adds that:

All true helpfulness begins with humbleness towards the person I seek to help, and this is why I have to understand that helping is not wanting to rule, but to serve. If I cannot do this, I cannot help anybody (our translation of Kierkegaard, 1869, in Becker Jensen, 2001: 18).

Kierkegaard points out two important maxims that are still valid for expert-to-layman communication: It is the level of the target group which should determine the level and style of the text, not the writer’s level – otherwise the extra knowledge of the expert becomes useless to the reader. The writer must be humble and possessed of a true desire to be of assistance, i.e., should not be preoccupied with his own status and authority.

The target group in expert-to-layperson communication is often potentially the entire population and must therefore be characterized as very broad indeed, which is why the visualization of a target group may well be a very substantial problem to the writer. The expert writer is in danger of overestimating his audience because of his own extensive knowledge and may be afraid of sounding patronizing if too much is explained. An expert writer may also feel that very simple language questions his status as expert – after all, expert language signifies expertise and authority to many. All things considered, if there is a true desire to make a text understandable to all laypeople and not just half of them the safe way is to use the lowest common denominator as a yardstick. If there is a well-defined target group, the lowest common denominator within that group should be used.

Kierkegaard's two maxims should be kept in mind at an overall level, whereas the following may be of assistance at a more specific level when writing for laypeople.

Characteristics of Professional-Lay Medical Language

Incomprehensible Medical Jargon Perhaps the most defining feature of medical – or expert – language is the use of expert terms unknown to most people. For example, we may see the use of 'therapeutic indications,' 'contra-indications,' and 'interactions' in the headlines of an insert. These terms should be replaced by lay terms when possible or should be paraphrased. It should be noted that most medical jargon has Latin or Greek roots, but that the extent to which Latin medical terms have been incorporated in everyday language varies greatly from country to country. French and English have, for instance, been more receptive to Latin than German and Scandinavian languages.

False Friends False friends within an expert-to-lay context are words and expressions that are used both in everyday situations and in special contexts but in which the meaning of the words differs depending on the context in which the words are used. For example, the expression 'to administer' is the formal use of giving someone a drug. However, the expression is also used in a more informal sense in business or legal settings but with a totally different meaning. It may be very confusing to the reader if he knows the word well from other contexts but cannot make sense of it in the context in question. The use of such terms should therefore be avoided.

Inconsistent Use of Synonyms Generally, medical language is characterized by sparse use of synonyms but, when they occur, perhaps especially in expert-to-lay texts in which semiexpert terms or lay terms are used, too, the reader who does not possess the expert knowledge needed to judge whether the terms are synonyms or not may become confused when confronted with two or three different terms for the same thing. This is, for example, the case when 'lactation' and 'breastfeeding' are used interchangeably. Stylistic variation should be avoided if there is a risk of sacrificing understanding.

Long or Complicated Words or Expressions Traditionally medical expert language often makes use of officialese. Strictly speaking, this has nothing to do with medical jargon or with the advantages of expert language such as brevity and precision, rather the opposite. Still medical texts are often characterized

by unnecessarily long or complicated words and expressions which make the text more difficult to digest. These superfluous words or blown up expressions should be removed and replaced with more simple ones.

Long and Complicated Sentences These are often a direct consequence of situations in which long and complicated words and expressions coupled with a too complex sentence structure result in lengthy, inflated sentences. Such sentences should be reduced by omitting superfluous words and expressions and can in many cases be split up into two or three shorter sentences.

Passive and Impersonal Style In expert communication, it is often not particularly relevant to know who the 'actor' is. Thus, instead of using the active voice, medical experts rely on a passive style making use of the passive voice and nominalization. In the passive voice, the person performing the action is deleted. This strategy may be quite useful in texts in which the actor is either unknown or simply not important, but in cases in which the patient needs to know that *s/he* is to perform some kind of action (e.g., in connection with a patient package leaflet) it is important to use the active style. The passive style makes the text impersonal and it forces the reader to take extra mental steps as *s/he* converts the passive sentence into an active one in order to work out "who is doing what." For example, an impersonal expression such as "X should not be taken during the first 3 months of pregnancy" should be replaced by a more active expression "you should not take X during the first 3 months of pregnancy." Passive sentences should be turned into active voice and undue nominalizations should be avoided in favor of the more direct verbal form.

Too Much Information in One Sentence Contrary to sentences containing superfluous words, these sentences are complex because they contain too much *relevant* information. For example, "This includes previously untreated patients and patients who have previously responded to treatment with X, but whose condition has recurred." Apart from listing too much relevant information, the sentence is also complex because it is packed with heavy noun phrases. Very often, sentences become rather long and complex because the writer adds extra information to the noun by means of pre- and postmodifiers. The result is heavy noun phrases, which – when unpacked – would constitute sentences in their own right. To non-experts, these sentences can be very difficult to unpack correctly. Such sentences should be edited by splitting them up into two or three shorter sentences.

Remnants from Translation Many medical experts are used to reading and discussing in English although it is not their native language. Modern non-English medical language is often very influenced by English lexis and even syntax. This may be a problem to non-English speaking laypeople.

Presuppositions A text that to an expert has a logical structure may not be logical to a layperson. If the writer relies on presumed (but nonexistent) background knowledge of the reader, the reader may be unable to follow the thoughts of the writer and may think that he jumps to conclusions.

Evidently, it is not realistic to completely avoid all of the above expert features. But the reason why expert language may be difficult to laypeople is the fact that these features tend to appear together in a sentence. Several studies show that they make the text less accessible to the general reader (see, e.g., Killingsworth and Gilbertson, 1992; Killingsworth and Steffens, 1989).

Length There are of course different conventions for the length of a text, but lay texts should never be longer than strictly necessary.

Print Size Information on medicine is often provided in far too small print that may discourage readers even before they have started. The print size should be reader-friendly.

Order of Information The order of information should be as logical as possible. Usually a sound strategy is to place the most important information in the beginning of the text.

Headings Well-placed, informative, and precise headings help weak readers navigate through a text. Headings should be written in clear and understandable terms and should not be too long.

Pictograms For instructional texts, pictograms may be a good solution, but the pictures or symbols should in no way be open to interpretation. This is more difficult than it sounds – a picture of a glass of water may to one reader mean that a pill should be dissolved in a glass of water, whereas to another it indicates that a glass of water should be drunk after swallowing the pill.

Conclusion

In spite of this attempt to describe the ‘ideal’ characteristics of professional-lay medical communication, professional-lay communication is still in its infancy and the discourse conventions are not in place.

Professional-lay discourse in the medical context may best be described as a ‘pseudo’ discourse for the time being, in which professionals – with varying success – try to adapt their medical language to a mixed audience (potentially the entire population) whose knowledge of the subject matter and the discourse conventions of the medical field is very restricted. What we experience is a semiprofessional discourse that attempts to merge the qualities of traditional medical language with the discourse conventions of ‘plain English’ style guides. One could speculate about the reasons for the lack of successful professional-lay communication. No doubt many of the problems can be attributed to the enculturation of health-care practitioners into the medical domain through language that means that the *discourse* and *practice* of medicine are difficult to separate. More specifically, it has the following consequences:

- Medical experts generally lack the ability to downgrade their special language in order to accommodate a target group of nonexperts. The medical experts are experts within medicine, not within plain English communication.
- Medical experts feel less inclined to adopt a fully professional-lay discourse, as it may question their status as experts – after all, expert language signifies expertise and authority to many. They may even feel that talking medicine at a lower level of abstraction demystifies their profession and results in status loss.
- Finally, medical experts resist the professional-lay discourse for ideological reasons. Because of their scientific schooling, medical experts may regard professional-lay discourse a language for *mediation*, inappropriate for talking about medicine because the required simplification in professional-lay discourse (which promotes a personal, subjective, action-oriented style) does not meet the demands for precision, conciseness, objectification, and passivity, which is the paradigm of medical science.

Thus, instead of developing a professional-lay medical discourse, which enables experts to explain medical concepts at a lower level of abstraction, the experts resort to their habitual way of communicating (i.e., the language into which they have been socialized when acquiring their expert knowledge) in spite of the fact that their expert language is difficult to understand for ‘outsiders’ and therefore hampers the readability and usability of consumer-oriented medical documents.

And so, today, we face a situation in which, in spite of the fact that the medical community produces numerous documents for patients (package inserts, health leaflets, information letters prior to hospitalization, etc.), the professional-lay discourse has not

been fully developed (and embraced) by the medical discourse community. Therefore, the discourse remains a hybrid between traditional medical language and consumer-oriented plain English.

Metaphor: Philosophical Theories

M Arseneault, University of Wisconsin-Madison, Madison, WI, USA

Metaphor and Philosophy

Rather than simply interpreting particular metaphorical expressions, philosophers of language investigate questions such as whether metaphors mean what they do in virtue of semantic content, or whether pragmatic features of expression use and context determine the meaning of metaphors. Answering such questions requires addressing fundamental issues in language and communication such as issues about the limits of literal meaning and the semantic-pragmatic distinction.

Defining Metaphor

Metaphor theorists disagree about which class of expressions constitutes the proper object of an analysis of metaphor. While most metaphor theorists favor live metaphors (metaphors that invite a multitude of interpretations), others such as George Lakoff and Mark Johnson (1980) focus on dead metaphors (metaphors with a relatively fixed meaning) and their role in structuring cognition. At the same time, some metaphor theorists adopt broader definitions while others work with narrower definitions of metaphor.

Metaphor, in its broadest sense (metaphor₁), includes most if not all figurative language such that the principle contrast is between metaphorical and literal language. Narrower definitions take metaphor to be

only one among many other non-literal tropes. A second type of metaphor (metaphor₂), distinct from other non-literal tropes such as irony, metonymy, and synecdoche, is what makes us think of one thing *as* another. Since the very possibility of giving a unified account of metaphor₁ is remote, articulating an account of metaphor₂ is a more appropriate goal. However, a demarcation problem remains a challenge for any treatment of metaphor₂: it must be worked out what it means to say that metaphor₂ makes us think of one thing as another in such a way that the difference between metaphor and other non-literal tropes is illuminated.

Delineating Metaphor

The class of metaphorical expressions can be delineated by form or by function. The paradigmatic form of metaphors is the subject-predicate form *S is P*. Metaphorical expressions of this kind are the focus of, for example, John R. Searle's (1993) account of metaphor. According to Searle, a speaker utters an expression of the form *S is P* (*Juliet is the sun*) in order to convey an intended proposition (that Juliet is radiant) of the form *S is R*.

Other accounts of metaphor delineate the class of metaphorical expressions according to a specific understanding of metaphor's function to make us think of one thing as another. For example, the comparison view of metaphor is the view that metaphor functions by comparing two things (Juliet and the sun). Delineating metaphor according to this function assimilates simile to the class of metaphors.

The clear disadvantage of constructing an account of metaphor around any particular form, even paradigmatic forms, is that doing so leaves unexplained other expression forms that have a plausible claim to metaphoricity. Extended metaphors that run the length of a poem and noun-function metaphors of the form *The B of A* (*The countless gold of a merry heart*) are not easily captured by the form *S is P*. Since diverse forms can carry out the same function, functional definitions of metaphor do better at capturing non-paradigmatic forms. Functional definitions explain why we use metaphor (e.g., to compare) in a way that form alone cannot.

The Metaphorical and the Literal

Almost every metaphor theorist accepts the Deviance Thesis: metaphor is essentially nonstandard and deviates either semantically or pragmatically from ordinary literal language. The Deviance Thesis is reflected in the persistent, but challenged (Cohen, 1976), view that metaphors are either literally false or conceptually incongruous.

Deviance and Value

Historically, the deviance of metaphor has been tied to the question of the value of metaphor. Although Cicero (*De Oratore*), Quintilian (*Institutio Oratoria*), and rhetoricians celebrated the deviance of metaphor and its embellishment of language, philosophers John Locke (*Essay concerning human understanding*) and Thomas Hobbes (*Leviathan*) condemned the use of metaphor in philosophical inquiry. If the best chance at arriving at and communicating truth is afforded only by unambiguous literal language use, metaphor's deviance from the literal is therefore suspect. Jean-Jacques Rousseau (*Essay on the origin of languages*) and Friedrich Nietzsche (*On truth and falsity in their ultra-moral sense*) attempted to undercut this criticism by arguing that all language is fundamentally metaphorical and championed metaphor's creative function. For a short history of philosophical thought about metaphor, see Johnson (1981) and Kittay (1987).

Deviance: Semantic or Pragmatic?

The cognitive value of metaphor is now generally conceded and metaphor's deviance is considered separately from its value. Contemporary accounts of metaphor characterize its deviance either as a violation of semantic rules or as a violation of pragmatic constraints. Various semantic theories can describe the semantic deviance of metaphor; for example, it can be described as a violation of selection restrictions or as a violation of standard meaning lines between possible worlds.

Samuel R. Levin (1977) describes construal mechanisms for assigning interpretations to anomalous or deviant sentences, including the metaphors of ordinary language use and conversation. Metaphors are semantically deviant because they fall outside the class of sentences generated by normal operation of the rules of grammar. According to the metaphor *The stone died*, to be a stone in the metaphoric sense (to be a dunce) is to be similar in characteristics to a stone in the literal sense. The noun *stone* has semantic markers that might include ((Object) (Physical)) (Nonliving) (Mineral)), and the verb *die* has semantic markers that may include ((Process) ((Result) ((Cease to be) (Living))))). The verb has selection restrictions ((Human) or (Animal) or (Plant)), and it is these restrictions that are violated in *The stone died*. Construal rules that sanction the transfer of the feature (Human) to the semantic markers of *stone*, for example, allow us to derive the interpretation that the dunce died.

Jaakko Hintikka and Gabriel Sandu (1990) characterize the semantic deviance of metaphor according to possible world semantics. On this view, meanings are functions from possible worlds to classes of individuals. We can visualize this function by imagining that a notional meaning line connects the individuals, in their respective possible worlds, picked out by the function. Metaphoric meaning is a function that draws nonstandard or deviant meaning lines: they differ from literal meaning lines in that they rely exceptionally heavily in some specific respect on either qualitative or functional similarity. In *The stone died*, the speaker draws the meaning lines of *stone* on the basis of qualitative hardness and immovability.

Pragmatic accounts of metaphor are motivated by the observation that the very same expression (for example, *A storm is gathering*) can be interpreted literally in one context (said of a dark and windy sky) and yet be intended and interpreted metaphorically in another context (said of an anticipated faculty meeting). A full explanation of metaphor, then, must look beyond merely the expression itself to the context of the utterance. H. Paul Grice's theory of conversational implicature provides a pragmatic account of the deviance of metaphor. Conversational implicatures, including metaphor, arise when what is said violates conversational maxims. Grice (1975) says that metaphor violates the conversational maxim of saying only what is true, while Dan Sperber and Deirdre Wilson (1986) argue that it violates the principle of saying only what is relevant. In either case, it is noticing that what is said deviates from these maxims and principles that prompts the hearer to search for an interpretation of the utterance (*Juliet is the sun*) such that the speaker is contributing something true or relevant to the conversation (that Juliet chases away darkness).

Joseph Stern (2000) presents a dual challenge to the Deviance Thesis: unlike Levin, Stern argues that metaphor is not grammatically deviant and, in contrast to Gricean pragmatic accounts, that it is not necessary to first notice that what is said is deviant. Stern suggests that metaphor is a linguistic type representable in the grammar by the operator *Mthat*[Φ]. Like indexicals and demonstratives, metaphors have both a character and a content. The character, or meaning, of a metaphor is the linguistic function from context to content expressions; the content of a metaphor is the propositional content determined by the character (i.e., the interpretation of the metaphorical expression). For example, in an analysis of *Juliet is the sun*, in which the predicate is the metaphorical component, the character of the metaphor picks out the content of {*Mthat*['*is the sun*']}, that is, properties (nourishing, chasing away darkness, etc.) that are associated with the sun.

Stern argues that metaphor is not pragmatically deviant in the way suggested by implicature theorists, insofar as what is conveyed by a metaphor is not inferentially derived against a background of conversational maxims. Instead, the rules of grammar simultaneously make available metaphorical and literal interpretations. Stern and others (Glucksberg and Keysar, 1993; Récanati, 1995) cite evidence that the metaphorical interpretation of the sentence is processed in parallel with, and not serially to, the literal interpretation. It is not necessary to recognize first that what is said violates pragmatic constraints.

Theories of Metaphor

Conditions of Adequacy

Theories of metaphor are successful to the extent that they fulfill certain conditions of adequacy. For example, the proposal that metaphorical expressions are ambiguous fails, because it cannot explain how the meaning of the metaphorical expression depends on the literal meaning of the words used. Unlike ambiguous expressions (example, *bank*), the meaning of the words on one (literal) interpretation stay 'active' and guide the other (metaphorical) interpretation. Other desiderata include explanations of the expressive power and catachretic function of metaphor to remedy gaps in the vocabulary by using words in new ways. Accounts should make sense of the ubiquity of metaphor and explain why some metaphors fail. The more controversial features of metaphor, such as its apparent falsity and nonparaphrasability, must either be accounted for or be explained away. For further discussion of these and other conditions of adequacy, see Nogales (1999).

Aristotle

Aristotle defines metaphor as the transference of a name from genus to species, from species to genus, from species to species, or by analogy. In his influential treatment of metaphor (found in *Poetics* and in *Rhetoric*) we find the seeds of substitution, analogy, and simile theories of metaphor. Under Quintilian's substitution theory of metaphor, a new decorative name is transferred to an object in substitution for its usual plain name, though for merely rhetorical effect. Analogy theories of metaphor have been of particular interest to those interested in the predictive nature of scientific models (Hesse, 1966; Gentner, 1982). Because Aristotle thinks that the function of both simile and metaphor trades on comparison and noticing pre-existing similarities, he is also credited as an early proponent of the view that metaphor is a kind of simile. The elliptical simile theory of metaphor specifies that metaphors such as *Time is a child at play* are ellipses of corresponding similes (*Time is like a child at play*). Lynne Tirrell (1991) argues that not all metaphors have corresponding similes, such as metaphors of the form *A is Ψ* (*The moon is envious*). Therefore, although metaphor theorists continue to be tempted to explain metaphor in terms of simile (Fogelin, 1988), elliptical simile theories of metaphor apparently cannot serve as general theories of metaphor.

Interaction Theories of Metaphor

Interaction theories of metaphor have a prominent place among contemporary semantic theories of metaphor. Introduced by I. A. Richards (1936) and Max Black (1962), this kind of theory proposes that instead of simply re-naming or comparing objects, two concepts or systems of associated commonplaces are simultaneously 'interactive.' In *my love is a rose*, the source (also called 'vehicle' or 'focus') *rose* projects an isomorphic set of connotations or believed commonplaces (such as fragility) upon the topic (also called 'tenor') *my love*. Eva Feder Kittay (1987) articulates this interaction in terms of semantic field theory. In this theory, the meaning of a term is a function of its relation (of affinity or contrast) to the other terms in its semantic or conceptual field. For example, the meaning of *midwife* is a function of its semantic field structured according to relations among the agent (midwife), her patient (the mother), and the result (the child). For Socrates's metaphor of teachers as midwives, interactive projection consists of restructuring the relations among the terms in topic field (*teacher*) analogously to those in the source field (*midwife*). Reconceiving the topic in this manner permits the special and controversial creativity of metaphor: metaphor goes beyond exploiting existing

similarities to create new similarities or perspectives on the world (perspectival theory of metaphor). Metaphor makes us think of one thing as another because its function is to create a perspective from which we gain an understanding of that which is metaphorically portrayed.

Davidson and Metaphorical Meaning

Donald Davidson (1978) gives what is perhaps the most influential objection to any semantic treatment of metaphor. According to Davidson, the fundamental error of all semantic accounts of metaphor is to read the contents of the thoughts provoked by the metaphor into the content of the expression itself. Davidson denies that the concept of metaphorical meaning is required to explain how metaphor achieves its effect. Sharply distinguishing between what words mean and what words are used to do, Davidson argues that it is the meaning of words that is supposed to explain what can be done with words (and not, for example, the effects achieved by metaphor that explain the meaning of the metaphorical expression). It is because literal meaning and truth conditions, but not metaphorical meaning, can be assigned to sentences apart from particular contexts of use that only literal meaning has genuine explanatory power. If there is no metaphorical meaning, then theories of metaphor can tell us about the effects metaphors have on us, but they do not provide a method for decoding a special content conveyed by the metaphorical expression. See Leddy (1983) and Farrell (1987) for criticisms of Davidson's view, and Crosthwaite (1985) for a defense of Davidson's account.

Metaphor: Psychological Aspects

R Gibbs, University of California, Santa Cruz, CA, USA

© 2006 Elsevier Ltd. All rights reserved.

The psychological study of metaphor has had a major impact on the interdisciplinary understanding of language and thought. Thirty years ago, the topic of metaphor was mostly seen as peripheral to the major focus of research in both linguistics and psychology, because metaphor was primarily viewed as a poetic device that is not representative of how people ordinarily speak or think. But in conjunction with the emergence of cognitive linguistics in the 1970s and 1980s, psychological research has demonstrated that metaphor is ubiquitous in discourse, can often be easily understood and produced in appropriate social and linguistic contexts, and perhaps most importantly, is both a type of language use and a fundamental scheme of thought. This entry describes the empirical evidence relevant for, and the theories building on, these claims.

The Ubiquity of Metaphor in Language

Metaphor has traditionally been viewed as a distortion of both thought and language, because it involves the transfer of a name to some object to which that name does not properly belong. Speakers and writers presumably use metaphor as an ornamental feature for poetic and rhetorical purposes (e.g., to say what is difficult to state literally, to express meaning in a vivid manner), rather than to impart fundamental concepts. In each case of metaphorical language, a person aims to present some underlying analogy or similarity in the form of a condensed or elliptical simile. Thus, a metaphor of the 'A is B' form indirectly implies the speaker's intended literal meaning "A is like B in certain respects." For instance, the metaphor 'The car beetles along the road' describes the movement of the car as being like the movement of a beetle. Under this traditional view, metaphor should be infrequent in language, especially in scientific discourse, and people should have more cognitive difficulty when uttering and understanding metaphors than they do when using the equivalent literal speech.

Psychological research has shown, however, that metaphor is a major part of both spoken and written language. Various studies have attempted to quantify the frequency of metaphor use in a variety of contexts. One detailed study examined the use of metaphor in transcripts of psychotherapeutic interviews, in various essays, and in the 1960 Kennedy-Nixon presidential debates and found that people used

1.80 novel and 4.08 frozen metaphors per minute of discourse (Pollio *et al.*, 1977). If one assumes that people engage in conversation for as little as 2 hours per day, a person would utter 4.7 million novel and 21.4 million frozen metaphors over a 60-year life span! A different analysis of the metaphors produced in television debates and news commentary programs showed that speakers use one unique metaphor for every 25 words (Graesser *et al.*, 1989). These, admittedly crude, analyses clearly demonstrate that metaphor is not the special privilege of a few gifted speakers, but is ubiquitous throughout both written and spoken discourse.

However, a closer look at everyday language suggests that these empirical attempts to 'count' instances of metaphor vastly underestimate the pervasiveness of metaphor in people's ordinary speech. Typical frequency counts of metaphor do not include analysis of conventional speech that is motivated by metaphoric modes of thought. Consider the following mundane expressions that people often use in talking about verbal arguments (Lakoff and Johnson, 1980).

Your claims are indefensible.
I've never won an argument with him.
I demolished his argument.
He attacked every weak point in my argument.
His criticisms were right on target.
He shot down all of my arguments.

At first glance, none of these expressions appear to be very metaphoric, at least in the same way that an utterances such as 'The sun is the eye of heaven' might be. Yet, a closer look reveals the systematic metaphoric structuring whereby people think of arguments in terms of wars. We can actually win or lose arguments. We see the person we are arguing with as an opponent. We attack his positions, and we defend our own. We plan and use strategies. We might find certain positions undefensible, requiring us to take new lines of attack. Each of these things do not simply reflect the way we talk about arguments: we actually argue as if we were in a war. Our understanding of argument as war is active and widespread, but this concept is so deeply entrenched in our ordinary conceptual system that we tend to miss its metaphorical character.

Cognitive linguistic research has suggested that there are perhaps hundreds of conceptual metaphors, such as ARGUMENTS ARE WARS, that structure our everyday experience, and that they are found in a wide variety of conceptual domains (Gibbs and Steen, 1999; Kövecses, 2002; Lakoff and

Johnson, 1999). Linguistic analyses do not typically quantify the number of verbal metaphors, and the conceptual metaphors underlying them, that may be present in any one sample of speech or text. But one psychological study of the narratives women produced when describing their experiences recovering from cancer showed that conventional metaphoric language was employed more than 6 times per minute, and that only 22 conceptual metaphors underlay the vastly different metaphoric expressions these women produced, especially in their talk of emotion (Gibbs and Franks, 2002). Conceptual metaphors seem to be ubiquitous in the ways people talk of their experiences. One question that has generated a great deal of debate within psychology is whether these instances of conventional metaphor necessarily reflect anything about the metaphorical nature of many abstract concepts.

Metaphor Understanding: The Standard View

The traditional belief that metaphor is deviant suggests that metaphors should be more difficult to interpret than literal speech. The most famous proposal along this line comes from H. Paul Grice's theory of conversational implicature (Grice, 1989) (also see Grice, H. Paul (1913–1988); *see* **Implicature**). Grice argued that the inferences needed to understand nonliteral meaning are derived from certain general principles or maxims of conversation that participants in talk-exchange are mutually expected to observe (Grice, 1989) (*see* **Maxims and Flouting**). Among these are expectations that speakers are to be informative, truthful, relevant, and clear in what they say. When an utterance appears to violate any of these maxims, as in the case of metaphor, listeners are expected to derive an appropriate 'conversational implicature' about what the speaker intended to communicate in context, given the assumption that he or she is trying to be cooperative (*see* **Cooperative Principle**).

Grice (1989) more specifically suggested what has become known as the 'standard pragmatic model' for understanding indirect and nonliteral meanings, including metaphor. In this view, understanding metaphor is accomplished in a series of steps: (1) analyze the literal meaning of an entire expression, (2) compare this literal meaning to the context, (3) if the literal meaning is appropriate, then stop, otherwise (4) derive an alternative meaning that makes the speaker's/writer's utterance sensible in the context, given the cooperative principle. This rational account suggests, then, that metaphors are understood as conversational implicatures and should take additional

time to comprehend over that needed to interpret literal speech that is appropriate to the context.

Psychological Tests of the Standard View

How accurate is the standard view as a psychological theory of metaphor understanding? First, the results of many reading-time experiments in psycholinguistics show that people do not always require additional mental effort to comprehend many kinds of figurative utterances, as compared with so-called literal speech (Gibbs, 1994, 2002). Listeners/readers often take no longer to understand the figurative interpretations of metaphor (e.g., 'billboards are warts on the landscape'), metonymy (e.g., 'The ham sandwich left without paying') (*see* **Metonymy**), sarcasm (e.g., 'You are a fine friend'), idioms (e.g., 'John popped the question to Mary'), proverbs (e.g., 'The early bird catches the worm'), and indirect speech acts (e.g., 'Would you mind lending me five dollars?') *see* **Speech Acts, Literal and Nonliteral**) than to understand equivalent literal expressions, particularly if these are seen in realistic linguistic and social contexts. Appropriate contextual information provides a pragmatic framework for people to understand metaphoric utterances without any recognition that these utterances violate conversational norms. In fact, psychological studies have specifically shown that people do not need to find a defective literal meaning before searching for a nonliteral meaning. For example, people apprehend the metaphoric meanings of simple comparison statements (e.g., 'surgeons are butchers') even when the literal meanings of these statements fit perfectly with the context (Glucksberg *et al.*, 1982). Even without a defective literal meaning to trigger a search for an alternative meaning, metaphor can be automatically interpreted.

These experimental findings from psycholinguistics are damaging to the general assumption that people understand metaphor as violations of conversational maxims. Similar psychological mechanisms appear to drive the understanding of both literal and metaphoric speech, at least insofar as early cognitive processes are concerned. Everyone agrees that people may sometimes take a good deal of time to process novel poetic metaphors, for example. Studies have shown, in fact, that conventional, or familiar, metaphors can be understood more quickly than novel expressions (Katz and Ferretti, 2001). Yet the additional time needed to understand novel metaphors is not necessarily due to a preliminary stage during which the literal meaning for an entire utterance is first analyzed and then rejected. Listeners may take longer to understand a novel expression, such as 'The night sky was filled with molten silver,' because of the difficulty

in integrating the figurative meaning with the context, and not because listeners are first analyzing and then rejecting the expression's literal meaning (Schraw, 1995).

Many psychologists have gone on to argue that even if metaphor does not necessarily demand extra cognitive effort to understand, people may still analyze literal, conventional, or salient, aspects of word meaning during immediate metaphor comprehension (Blasko and Connine, 1993; Giora, 2001). Some studies, which measure the meanings activated during each part of the moment-by-moment process of linguistic understanding, suggest that comprehending familiar and novel metaphors engages different linguistic processes. Analysis of literal word meaning still precedes metaphorical meaning during novel metaphor understanding, with both types of meaning arising in parallel during familiar metaphor processing. Other studies that assessed people's speeded judgments about the sensibility of different word strings at different moments find no difference in the comprehension speed for literal and figurative strings (McElree and Nordlie, 1999). This lack of time-course differences is inconsistent with the claim that metaphoric interpretations are computed after a literal meaning has been analyzed, and suggest that literal and metaphoric interpretations are computed in parallel.

Although these research findings imply that metaphor processing is not secondary to literal understanding, psycholinguists are, again, careful to note that people may be biased toward initially interpreting the literal, or salient, meanings of metaphoric statements in cases of novel metaphor (Giora, 2001). Yet others argue that even if some linguistic meanings (e.g., literal or metaphoric) are created sooner during metaphor processing, these findings do not imply that entirely different mental processes operate to produce these different meanings (Gibbs, 2002). Different kinds of meaning may arise from a single linguistic process. The fact that scholars label one kind of meaning 'literal' and another 'metaphoric' doesn't necessarily indicate that different processes operate (such as a literal processing mode and a metaphoric processing mode) as people access these meanings (either in a serial or parallel manner).

More recent theories of figurative language understanding, which are more general than metaphor theories *per se*, suggest that people may initially access a word's interpretation that can be compatible with both its literal and metaphoric meanings (Frisson and Pickering, 2001). Over time, however, people use context to home in on the word's appropriate metaphoric meaning, where the homing-in process is faster when the preceding context is strong, and

slower when the preceding context is neutral. In this way, context does not operate to distinguish between different literal and metaphoric meanings, as assumed by most theories (such as in the standard model), but functions to change an underspecified, or highly general meaning, into a contextually appropriate, specific interpretation which may be metaphorical.

A different theory embraces the notion of 'constraint satisfaction' to provide a comprehensive model of the different sources of information that constrain metaphor understanding (Katz and Ferretti, 2001). Under this view, understanding a metaphoric utterance requires people to consider different linguistic (e.g., people's familiarity with words and phrases) and nonlinguistic (e.g., related to specific context) information that best fits together to make sense of what a speaker or writer is saying. These different sources of information are probabilistically evaluated, and combined to offer a most likely 'winning' meaning for a metaphor. A constraint satisfaction model may have the flexibility to account for a wide variety of metaphor processing data that seems to differ depending on the familiarity or conventionality of the expression, the context in which it is encountered, and the speaker's/writer's likely intentions in using metaphorical language.

In summary, there has been a great deal of psychological research devoted to the general question of whether metaphorical language requires additional cognitive effort to understand, compared to non-metaphorical speech. The findings of these widely varying studies strongly imply that metaphors are not deviant and do not necessarily take more time to understand, but that more subtle factors, such as the familiarity of the expression and the context in which it is used, can shape the time-course of metaphor understanding. Many studies now situate metaphor understanding within a more comprehensive view of linguistic processing that does not posit specialized mechanisms for interpreting metaphors, even if these expressions often convey distinctive kinds of meanings (Kintsch and Bowles, 2002), and which specifically relies on cognitive mechanisms, such as suppression, that are employed widely in all aspects of language processing (Gernsbacher and Robertson, 1999).

Psychological Models of Metaphor Understanding

A great deal of research has been devoted to the specific processes involved in understanding metaphorical meaning, beyond the general question of whether metaphors are more difficult to comprehend than literal speech. These studies have explicitly examined the ways that the A, or target, and B,

or vehicle, terms interact to produce metaphorical meaning. A long-standing assumption in many academic fields is that we understand metaphors by recognizing the ways that topic and vehicle terms are similar. Thus, in understanding the metaphor 'Juliet is the sun,' listeners are presumed to figure out the properties of both Juliet and the sun that are similar.

But psychological studies indicate that metaphor comprehension does not demand that the topic and vehicle terms share properties or associations (Camac and Glucksberg, 1984). This finding is supported by many studies showing that metaphors have directional meaning. If metaphorical meaning arises from the overlap of the semantic features of topic and vehicle, expressions such as 'The surgeon is a butcher' and 'The butcher is a surgeon' should have similar metaphoric meanings. But this is clearly not the case. The similarity that arises from the comparison of a topic and vehicle does not produce metaphorical meaning. Instead, similarity is created as an emergent property of understanding metaphor. Thus, many psychological studies have demonstrated that novel features emerge from metaphor comprehension that are not salient in one's separate understanding of the topic or vehicle (Gineste *et al.*, 2000). This idea is consistent with the popular, but somewhat vague, interactionist theory of metaphor (Black, 1979), which argues that the presence of the topic stimulates a listener to select one of the vehicle's properties so as to construct a 'parallel implication complex' that may induce changes in one's understanding of both the topic and vehicle. In general, psychological studies provide strong evidence supporting the idea that metaphor cannot be reduced to rule-governed extensions or variations of the topic's and vehicle's literal meanings.

Psychologists disagree, however, about the cognitive mechanisms involved in feature emergence during metaphor understanding. The two main proposals state that metaphorical mappings between concepts from dissimilar domains can be accomplished by either comparison or categorization processes. Traditional comparison theories posit that metaphor understanding demands a mapping of low-salient features from the source domain with high-salient features of the target domain (Miller, 1979). But understanding many metaphors, such as 'Men are wolves,' seems to involve the activation of semantic features that are not typically associated with either the source or target domain until after the metaphor has been understood (Ortony, 1979). Gentner's 'structure-mapping' theory of analogy and metaphor avoids this problem by suggesting that people begin processing a metaphor by first aligning the representations of the source and target domain concepts

(see Gentner *et al.*, 2001). Once these two domains are aligned, further inferences are directionally projected from the source to the target domain. Finally, new inferences arise within the target domain, reflecting relational, and not just feature-specific, aspects of the metaphor comprehension processes. Experimental evidence in support of this comparison view shows, for instance, that people infer relational, but not feature-specific, meanings when interpreting metaphors (Gentner *et al.*, 2001). For instance, when people read 'Plant stems are drinking straws,' they infer that both plants and straws convey liquid to nourish living things, and not just that both plants and straws are long and thin (i.e., object commonalities). Other research indicated that metaphors that express relational information (e.g., 'Plant stems are drinking straws') are viewed as being far more apt than those that only map object features ('Her arms were like twin swans').

An alternative view claims that metaphors are better understood via categorization processes, as class-inclusion, rather than comparison, statements (Glucksberg, 2001). For example, the statement 'Yeltsin was a walking time bomb' asserts that the former Russian President was a member of a category that is best exemplified by time bombs. Of course, time bombs can belong to several other categories, such as the weapons used by terrorists. But in the context of talking about people, time bombs best exemplify the abstract category of 'things that explode at some unpredictable time in the future and cause a lot of damage.' In this way, metaphors reflect '*ad hoc*' categories and refer at two levels: the concrete level (i.e., an explosive device) and a superordinate level (i.e., the properties of time bombs).

One implication of the class-inclusion model is that it suggests that the topics and vehicles, or target and source domains, in metaphors play different but interactive roles in metaphor comprehension. For example, the word 'snake' evokes different meanings in the phrases 'my lawyer is a snake' and 'the road was a snake.' In this way, metaphor topics provide dimensions for attribution, while vehicles provide properties to be attributed to the topic. Psychological evidence supporting this position showed that in a reading-time study, presenting people first with a topic term that is highly constrained reduces the time needed for the subsequent processing of a metaphorical statement, in contrast to when people are first presented with a less-constrained topic (Glucksberg, 2001). Furthermore, presenting people with an unambiguous vehicle primes subsequent metaphor comprehension, in contrast to what happens when they are presented with an ambiguous vehicle term. This pattern of data illustrates how the level of constraint

is an important feature of metaphor topics, while the degree of ambiguity is an important characteristic of metaphor vehicles. Comparison models of metaphor understanding are unable to explain the importance of constraint and ambiguity, because they assume that metaphor comprehension always begins with an exhaustive extraction of the properties associated with both topics and vehicles. Having advance knowledge about either the topic or vehicle should presumably, then, prime metaphor processing. However, the categorization view correctly predicts that only advanced knowledge about highly constrained topics and unambiguous vehicles facilitates metaphor comprehension, a finding that is most consistent with the claim that metaphor understanding involves creating a new, *ad hoc* category and not merely comparing one's knowledge about topic and vehicle domains.

A proposal titled the 'career of metaphor' combines aspects of both the comparison and categorization views (Gentner and Bowdle, 2001). This theory claims that there is a shift in the mode of mappings from comparison to categorization processes as metaphors become conventionalized. For instance, novel metaphors such as 'Science is a glacier' involve base terms, such as 'glacier,' with a literal source (i.e., 'a large body of ice spreading outward over a land surface'), but no relational metaphoric sense (i.e., 'anything that progresses slowly but steadily'). People comprehend novel metaphors as comparisons in which the target concept (e.g., 'science') must be structurally aligned with the literal base concept (e.g., 'glacier'). In some instances, the comparison process may lead to the induction of a novel metaphor category. On the other hand, conventional metaphors can be understood either by comparison or categorization processes. For example, the metaphor 'A gene is a blueprint' has two closely related senses (e.g., 'a blue and white photographic print detailing an architect's plans' and 'anything that provides a plan'). The relations between these two senses make the conventional base term polysemous (i.e., semantically related literal and metaphoric meanings). As such, conventional metaphors may be understood by matching the target concept with the literal base concept (a comparison process) or by viewing the target concept as a member of the superordinate metaphoric category named by the base term (a categorization process).

Metaphor in Thought

Most of the psychological research on metaphor has focused on how it is used and understood within language, and has assumed that metaphorical meaning is created *de novo*, and does not reflect

preexisting aspects of how people ordinarily conceptualize ideas and events in terms of pervasive metaphorical schemes. But in the past 20 years, various linguists, philosophers, and psychologists have embraced the alternative possibility that metaphor is fundamental to language, thought, and experience. Cognitive linguists, for instance, claim that metaphor is not merely a figure of speech, but is a specific mental and neural mapping that influences a good deal of how people think, reason, and imagine in everyday life (Lakoff and Johnson, 1999). Evidence supporting this claim comes from linguistic research on the historical evolution of what words and expressions mean, the systematicity of conventional expressions within and across languages, novel extensions of conventional metaphors, studies on polysemous word meaning, and nonverbal behaviors such as gesture (Gibbs, 1994; Lakoff and Johnson, 1980, 1999).

However, psychologists have been critical of much of this work and its possible implications for theories about conceptual structure and metaphor understanding. First, most of the evidence for metaphorical thought, or conceptual metaphor, comes from purely linguistic analyses, and psychologists have expressed deep skepticism about these claims on both methodological and theoretical grounds, especially with regard to linguists' heavy reliance on their own linguistic intuitions (Murphy, 1996). Second, some psychologists argue that conceptual metaphor theory is unfalsifiable if the only data in its favor is the systematic grouping of metaphors linked by a common theme (Vervaeke and Kennedy, 1996). Consider again the conceptual metaphor ARGUMENT IS WAR (Lakoff and Johnson, 1980), which presumably motivates conventional expressions such as 'He attacked my argument' and 'He defended his position.' Cognitive linguistic research suggests that any expression about argument that does not fit the WAR theme is usually seen as evidence for another theme, such as WEIGHING, TESTING, or COMPARING. This implies that no linguistic statement can be brought forward as evidence against the ARGUMENT IS WAR metaphor, which makes the basic tenet of conceptual metaphor theory impossible to falsify. Finally, some psychologists argue that many conventional expressions viewed as metaphorical by cognitive linguists are really not metaphorical at all, but are treated by ordinary speakers/listeners as literal speech (Glucksberg, 2001). Simple expressions like 'He was depressed' are entirely literal, and may not be motivated by a conceptual metaphor such as SAD IS DOWN, because they only reflect something about the polysemous nature of meaning (e.g., 'depression' can be used to talk about either physical depression or emotional depression).

Psychological Studies on Conceptual Metaphor

Despite the skeptical reaction of some psychologists to the idea of metaphorical thought, or conceptual metaphor, there is a great deal of psychological evidence supporting the claim that many aspects of people's abstract concepts and reasoning processes are shaped by enduring conceptual metaphor. Studies show, for instance, that conceptual metaphors influence the ways people conceive of various abstract domains, such as emotions, minds, politics, advertising, scientific theories, the self, morality, learning, and problem-solving (Gibbs, 1994; see Steen and Gibbs, forthcoming, for reviews). Most of these studies demonstrate that providing people with a particular metaphorical construal of some domain (e.g., that EMOTIONS ARE CONTAINERS) can facilitate the way they learn new information, solve problems, and make decisions, if the newly encountered material has a similar metaphorical structure. At the same time, whereas switching from one conceptual metaphor to another may require more cognitive effort in some situations (Langston, 2002), people typically have multiple metaphorical ways of conceiving of most abstract ideas (e.g., THEORIES ARE BUILDINGS, THEORIES ARE FABRIC (Gibbs, 1994). This multiplicity of metaphorical schemes provides another source of evidence for the idea that a good deal of ordinary thought is shaped by metaphor.

Even if people seem able to think metaphorically about various domains, many psychologists and especially many psycholinguists are skeptical about whether conceptual metaphors are normally recruited during people's ordinary comprehension of language (Glucksberg, 2001). These critics find it difficult to believe that conceptual metaphors play much of a role in how people interpret verbal metaphors such as 'Surgeons are butchers' or 'Lawyers are snakes.' To a large extent, the debate over conceptual metaphor settles into two camps: those scholars studying novel metaphors and those studying conventional language that may reflect different conceptual metaphors (e.g., 'He attacked my argument' for ARGUMENTS ARE WARS, 'Our relationship hit a dead end street' for LIFE IS A JOURNEY, and so on). Thus, different approaches to the psychology of metaphor understanding are oriented toward different types of metaphorical language. A likely possibility is that conceptual metaphor may have a strong influence on some aspects of verbal metaphor use, but not on others.

In fact, there is a large body of evidence from psychological studies, employing different methods, that clearly demonstrates that (a) people conceptualize certain topics via metaphor, (b) conceptual metaphors assist people in tacitly understanding why

metaphorical words and expressions mean what they do, and (c) people access conceptual metaphors during their immediate, online production and comprehension of conventional and novel metaphors. This work includes studies investigating people's mental imagery for conventional metaphors, as in idioms and proverbs (Gibbs and O'Brien, 1990), people's context-sensitive judgments about the figurative meanings of idioms in context (Nayak and Gibbs, 1990), people's immediate processing of idioms (Gibbs *et al.*, 1997), people's responses to questions about metaphorical expressions about time (Boroditsky and Ramscar, 2002; Gentner *et al.*, 2002), readers' understanding of metaphorical time expressions (McGlone and Harding, 1998), and studies looking at the embodied foundation for conventional metaphoric language (Gibbs *et al.*, 2004).

To briefly give a few examples from these psycholinguistic experiments, studies show that people have a complex metaphorical understanding of many abstract domains, which partially motivates everyday reasoning and language use. For instance, people conceive of the domain of emotions metaphorically, based partly on their embodied experiences of emotions, such that they tacitly know that phrases like 'blow your stack' and 'flip your lid' are motivated by the conceptual metaphor of ANGER IS HEATED FLUID IN A CONTAINER. This metaphorical understanding of anger influences people's judgments about the degree to which someone experiences anger and about the best use of different metaphorical phrases in context (Nayak and Gibbs, 1990). At the same time, people's tacit knowledge of conceptual metaphors constrains the specific mental images they can form for verbal metaphors, and the specific meanings they believe these metaphors express (e.g., that 'blow your stack' means to get very angry while the person is feeling internal pressure, and the expression of the anger is unintentional and forceful) (Gibbs and O'Brien, 1990). In fact, many conventional phrases and idioms, long thought to be dead metaphors, retain much of their metaphorical meaning precisely because they continue to be linked to enduring conceptual metaphors. Finally, priming studies suggest that reading a conventional metaphorical phrase, such as 'John blew his stack,' quickly accesses the conceptual metaphor (ANGER IS HEATED FLUID IN A CONTAINER) that partly motivates why this expression has the particular metaphorical meaning it conveys (Gibbs *et al.*, 1997). Reading another expression with roughly similar metaphoric meaning, such as 'John bit her head off,' activates a different conceptual metaphor (ANGER IS ANIMAL BEHAVIOR), giving rise to the creation of these metaphorical expressions.

The debate over the role that metaphorical thought may play in a psychological theory of verbal metaphor use will likely continue. Once more, it seems inevitable that several of the different approaches to metaphor within linguistics and psychology will become part of a more comprehensive theory of metaphor. Yet it is already evident that the traditional views of metaphor as deviant, ornamental aspects of language and thought no longer are tenable and that psychological studies have provided excellent reasons to believe that metaphor is a fundamental part of the ways people speak and think.

Metaphor: Stylistic Approaches

G Steen, Vrije Universiteit, Amsterdam,
The Netherlands

Introduction

Stylistic approaches to metaphor used to take metaphor as one of the most important rhetorical figures of speech that could characterize a particular style. A representative illustration is provided in the classic textbook *Style in fiction*; the authors, Leech and Short (1981: 79), offered a checklist for stylistic features: metaphor is included in the section on tropes, together with metonymy, synecdoche, and other figures of speech defined by 'strange meaning' or 'semantic deviation.' In contrast, schemes, the other main group of rhetorical figures of speech, are defined by repetition of form, or 'structural parallelism,' such as chiasmus and rhyme. According to Leech and Short, schemes and tropes together constitute one of the four dimensions of style, the other three dimensions involving features of vocabulary, grammar, and text (still called cohesion and context). This stylistic angle on metaphor, representative of most mainstream positions, hence distinguished metaphor from ordinary meaning and its linguistic basis (vocabulary, grammar, and text) and treated it as a separate class of phenomena requiring special treatment.

Since the publication of *Style in fiction*, however, the perception of the relation between metaphor, style, and language has dramatically changed. Metaphor – once regarded as the rhetorical figure par excellence, being parasitic on ordinary or literal meaning, deviant, dangerous, and misleading – is now seen as one of the foundations of all language, and its use, being constitutive of meaning, is seen as normal, grounded in experience, and offering guidance to linguistic expression. The presence of metaphor as such is not necessarily indicative of any particular style, as it used to be. Instead, it is part of common, everyday language, as is attested by the many metaphorical

forms (words, phrases, morphemes, and even grammatical constructions) that are entirely conventional. The publication that has been pivotal in this change of perspective, Lakoff and Johnson's *Metaphors we live by* (1980) (cf. Lakoff and Johnson, 1999), provides a wealth of examples of the ubiquity of metaphor in language, including conventional talk of *love* as 'a journey,' *argument* as 'war,' *theories* as 'buildings,' *understanding* as 'seeing,' and *life* as 'a gambling game.'

The new view holds that metaphor may still be exploited for rhetorical purposes. However, the present-day stylistician has to analyze the specifics of this exploitation against the background of the more general patterns of metaphor pervading language and its use. This means that classic studies of metaphor in literary style, such as David Lodge's *The modes of modern writing* (Lodge, 1977), are not invalidated by the new approach, since they also include the stylistic use of conventional metaphor, but their theoretical and empirical suggestions do require more extensive investigation of the relation between metaphor in style and metaphor in all language use (Steen and Gibbs, 2004). That is the direction taken by many recent stylistic approaches to metaphor. What has remained unchanged between the traditional and the contemporary views of metaphor is the awareness of metaphor's cognitive import. Aristotle, Giambattista Vico, Percy Bysshe Shelley, Friedrich Nietzsche, I. A. Richards, Max Black, and Paul Ricoeur, to name but a few of the numerous metaphor theorists over time, have all pointed to the conceptual or cognitive basis of metaphor: metaphor draws attention to similarities or correspondences between entities or domains that are fundamentally distinct. This happens in everyday talk of sports in terms of war, or lust in terms of hunger. But it also motivates the more spectacular or subtle stylistic exploitations of metaphor, as in Aristotle's discussion of Homer's comparison between old age and wheat stubble (see Mahon, 1999).

A concomitant constancy between old and new theories of metaphor is the derived attention to its social, affective, and aesthetic import as the corollary of its conceptual structure. When people are compared to lions or to mice, they are compared to animals with a higher or lower status, and this has the accompanying social effect of praising or criticizing them. In addition, when this happens perversely, it can produce irony and humor, and perhaps some admiration for the aesthetic wit of the usage, depending on the occasion and the perception of the producer's rhetorical intentions. But perfectly ordinary metaphorical expressions, such as *time is money*, also have social and affective implications, which are part and parcel of the stylistic effect of a metaphor. The mechanisms of these effects have been studied by experimental psycholinguists (e.g., Gibbs, 1994) and by conversational analysts and applied linguists (Cameron and Low, 1999). Stylistic approaches, however, are typically more focused on the functional analysis of metaphor, effects on cognition being left to the behavioral sciences.

Definition

Metaphor as a feature of style is a subclass of all metaphor in language and its use. The stylistic definition consequently has to distinguish metaphor as a stylistic device from metaphor as a more general linguistic mechanism. The stylistic definition hence approaches metaphor as one typical characteristic of a particular language variety that is relatively individual or idiosyncratic, such as the style of an individual work or author, or more generally, language user. For instance, the metaphors of politicians such as Tony Blair or George W. Bush are important ingredients of their style. But metaphor may also be characteristic of broader patterns of usage across groups of language users, including, for instance, sports reporters or songwriters. Such encompassing language varieties, or registers, are typically based in more general classes of usage that transcend individual styles. However, those manifestations of metaphor will also be considered as having a stylistic interest because of their typical role in clearly identifiable registers and genres.

As suggested previously, the difference with traditional stylistic approaches is that metaphor today is not just taken as a rhetorical device that should be opposed to ordinary vocabulary, grammar, and texture. Instead, the use of metaphor in those non-rhetorical provinces of language may also have a stylistic function. Thus, when a language user has a preference for one set of metaphors over another, both of which are completely conventional parts of the language, the preference may still be seen as a

feature of that language user's style, regardless whether it is glaringly prominent or revealed only by careful scrutiny or even statistical analysis.

The new, so-called cognitive-linguistic approach to metaphor launched by Lakoff and Johnson (1980, 1999) defined metaphor as a mapping between two semantic domains. Such crossdomain mappings can motivate varying numbers of systematically related linguistic expressions of a metaphorical kind. For instance, 'love' can be metaphorically conceptualized as a natural force, and we can hence say that somebody was *swept off his feet* or *bowed over* by another person. Such conventional metaphorical expressions are part and parcel of everyday language, and they have overt stylistic implications when they are used relatively deliberately as metaphors, or when new aspects of the mapping are exploited for discursive purposes. An example may be provided by rock singer Neil Young's lines "You are like a hurricane, there's foam in your eyes, and I'm getting blown away." But less prominent patterns of usage would be equally relevant, as when people consistently use one set of metaphors for marriage as opposed to other possible sets, either in conversations or in psychotherapy (Gibbs, 1994).

The cognitive-linguistic approach to metaphor has been developed in various ways (cf. Gibbs and Steen, 1999; Dirven and Pörings, 2002), with one line of theorizing, called 'conceptual integration theory' or 'blending theory,' offering a competing model that utilizes more than two conceptual domains or spaces (Fauconnier and Turner, 2002; cf. Grady *et al.*, 1999). The cognitive-linguistic approach has also given rise to alternative models, in particular in psycholinguistics (Glucksberg, 2001). These alternative models define metaphor in different ways, mainly questioning the basic assumption that crossdomain mappings are understood by means of some form of comparison (Giora, 2001; cf. Croft and Cruse, 2004). It should also be noted that the cognitive-linguistic definition of metaphor as a crossdomain mapping in conceptual structure allows for the possibility that not all metaphor in thought is expressed by metaphor in language. Crossdomain mappings in thought may also be realized by similes, analogies, extended metaphors, megametaphors, allegories, and parables, to mention just the most well-known alternatives (Steen and Gibbs, 2004). Therefore, stylistic approaches to metaphor have to be explicit about their preference for either the linguistic, formal definition of metaphor, which takes metaphor as one specific rhetorical figure, or the more general, cognitive definition, which takes metaphor as a figure of thought, which in turn includes a whole range of rhetorical figures and even text forms.

The advantage of adopting the more encompassing definition is its capacity for contrasting the stylistic functions of these various rhetorical forms. Thus, when a crossdomain mapping is expressed as a metaphor, it may slow down or even prevent the activation of a comparative interpretation strategy, whereas its expression as a simile may facilitate such a strategy (see Gentner and Bowdle, 2001). This, in turn, may decrease or increase the recognition and hence the experienced prominence of a metaphor in style.

There is yet another complication with the definition of metaphor. It would be incorrect to suggest that all linguists (and stylisticians) have embraced the cognitive-linguistic definition of metaphor that also includes all conventionalized metaphorical meaning. For instance, Jackendoff (2002), the most important representative of the generative-grammatical approach to semantics, believed that this went too far, and abided by the more restricted definition of metaphor as the relatively deliberate rhetorical figure. This means that, in effect, that there are currently three definitions of metaphor in style:

1. The restricted rhetorical definition of metaphor as active or deliberate metaphor.
2. The broader cognitive-linguistic definition, which focuses on metaphor as a specific linguistic form, whether it is active and deliberate.
3. The most encompassing, cognitive, definition, which defines metaphor as a crossdomain mapping in conceptualization that may be realized by various rhetorical figures, of which linguistic metaphor is one that has to be contrasted with simile, analogy, and so on.

History

The cognitive-linguistic approach emphasizes the cognitive and systematic nature of metaphor and therefore highlights its ubiquity and conventionality. This is an encompassing, linguistic approach, which does not take metaphor as just a stylistic device in the rhetorical sense of the term. To many scholars, the cognitive-linguistic approach has replaced older views of metaphor, which used to limit metaphor to the rhetorical phenomenon – that is, to those metaphors that are active – thereby drawing attention to their deviance as well as to the probability that they are deliberate. The cognitive-linguistic view argues in particular that it has taken over from the conceptualization prevailing in the 1960s, of metaphor as necessarily involving grammatical deviance, research showing that many metaphorical expressions in language are not deviant but rather are the norm.

Similarly, not all metaphors uncovered by the cognitive-linguistic approach require pragmatic inferencing, as was argued in the 1970s by John Searle and H. P. Grice, but may be understood with reference to conventionalized semantic mappings. The best overview of these different positions is still provided by Ortony (1993).

Another series of issues that has been important in the history of metaphor is the debate over the questions of whether metaphor is a matter of substituting a metaphorical expression for another, presumably literal one; whether it is a matter of comparison between unlike phenomena; or whether it is a matter of interaction between two distinct ideas (for an overview, see, e.g., Gibbs (1994)). Modern developments in cognitive linguistics have come to take a liberal view of the notion of correspondences in metaphor as a cross-domain mapping. This now includes both pre-existing and perceived similarity between phenomena (comparison), and interaction between conceptual structures (interaction), as is, for instance, summarized by Kövecses (2002) in his cognitive-linguistic introduction to the field. This broader view of metaphor in cognitive linguistics goes back as far as the classic position of Aristotle, who also saw metaphor as based in correspondences. At the same time, the new view re-establishes contact with the widespread structuralist views of metaphor as based in similarity, versus metonymy as based in contiguity (cf. Barcelona, 2000; Dirven and Pörings, 2002; Panther and Radden, 1999). It has led to new questions about the analysis of many metaphorical expressions. For instance, do we see time as money (metaphor) or do we see time **via** or **through** money (metonymy)?

A third historical issue has to do with the terminology for metaphor analysis. Cognitive linguistics and other cognitive scientific approaches of metaphor have introduced the distinction between ‘source’ and ‘target’ domains, whereby the source domain includes the knowledge of the metaphorically used concepts and words and the target domain includes the knowledge of the nonmetaphorically used concepts and words. These terms are now in competition with the traditional terminology, which calls the source domain the ‘vehicle’ and the target domain the ‘tenor.’ Yet another tradition talks about the source domain vocabulary as the metaphor ‘focus,’ and the target domain vocabulary is regarded as the ‘frame.’ Thus, in an expression such as *Time is money*, ‘time’ is called the tenor or a term from the target domain and ‘money’ is called the vehicle or a term from the source domain; ‘money’ is the focus, whereas ‘time is ...’ is called the frame. It is not clear which terminological tradition will prevail.

Classes of Metaphor

Metaphor can exhibit many different linguistic forms. Most attention has been paid to metaphorically used words, with some attention being paid to the various word classes, such as nouns, verbs, and adjectives (e.g., Goatly, 1997; Steen, 2002; Cameron, 2003). However, metaphor is also important for the study of phraseology, exhibiting connections with idiom and with the revitalization of allegedly dead metaphor (Naciscione, 2001), and systemic-functional grammarians have performed extensive study of grammatical metaphor and its stylistic and discursive functions (Simon-Vandenberg *et al.*, 2003).

Metaphor can also play a role in all kinds of meaning. For instance, study has been made of common source and target domains, which are typically (but certainly not exclusively) concrete and abstract, respectively. Kövecses (2002) listed as common source domains the human body, animals, machines and tools, buildings and construction, plants, games and sports, and so on; he listed as common target domains concepts such as life, time, death, emotions, thought, society, and so on. The study of the metaphorical conceptualization and expression of emotions, in particular, has been rather detailed and advanced (Kövecses, 2000). Particular combinations of source and target domains lead to well-known classes of metaphor, such as personification, concretization, or abstraction. One very specific class of metaphor involves the crossing of sensory modalities, producing synesthesia: we conventionally talk of *loud colors* and *dark sounds*, among many other possibilities.

The functions of metaphor in discourse are also various. Ernest Rutherford's model of the atom in terms of the solar system has a descriptive and explanatory function in science, as well as a didactic function in education. Psychologists have employed various metaphorical models of the mind, ranging from steam engines to computers. But highly conventional metaphors may also function as topic management devices in conversation. And highly innovative metaphors may function as the acme of artistic pleasure (for one list of functions of metaphor, see Goatly (1997)).

Further classification of metaphors in style is possible by considering their combination with other rhetorical figures. Oxymoron and paradox often require metaphorical interpretation to resolve their logical contradiction, as in *sweet sorrow*. Hyperbole and litotes often combine with metaphor to enlarge or diminish the object of comparison, as when a boxer is called 'Hurricane' or 'Raging Bull.' This leads to a consideration of the possibility of the laudatory as opposed to the critical use of these scales of comparison, involving the addition of irony, sarcasm,

and humor. Consider W. H. Auden's phrase of 'committing a social science,' a metaphorical phrase that turns social science into a crime. Similar combinations are possible of metaphor with schemes of form, involving parallelism and deviation in sound and grammar, as often happens in newspaper headlines or nicknames (think of tennis player Pete Sampras, who was called 'Pistol Pete').

Application

Metaphorical Utterances

Metaphor in style has a wide range of manifestations, including, to begin with, its striking use in specific utterances. Famous metaphorical quotations may illustrate this phenomenon, from the Bible's *The Lord is my shepherd* through Karl Marx's view of religion as *the opium of the masses*, to George W. Bush's repeated use of *the axis of evil* to refer to Iran, Iraq, and North Korea. Specific metaphors may also be conventionalized parts of the language in the form of sayings, such as *Time is money* or *How time flies*. In discourse, these may be used in their regular form to conventional effect, or they may be exploited for special purposes, as when Bob Dylan writes "Time is a jet plane, it moves too fast." When used in their regular form, metaphors often serve in conversations as topic management devices, signaling that one topic is being terminated and the conversation is moving on to another.

Some sayings are not metaphorical by their linguistic structure alone; strictly speaking, rather, they turn metaphorical only when they are applied to specific situations, such as when *Blind blames the ditch* is used for an accident without any blind people or ditches. Idiomatic expressions other than sayings may also be based on metaphor, and they may also be given specific twists, in what Anita Naciscione has called 'instantial stylistic use.' Here is her example with *the course of true love never did run smooth*, from D. H. Lawrence's story *Mr Noon*:

The course of true love is said never to run true. But never did the course of any love run so jagged as that of Joanna and Mr. Noon. The wonder is, it ever got there at all. And yet, perhaps, a jagged, twisty, waterfally, harassed stream is the most fascinating to follow [Naciscione, 2001: 74].

Another stylistic exploitation of specific metaphors involves allusion and intertextuality. A well-known example involves the title of William Faulkner's novel *The sound and the fury*, which harks back to Shakespeare's *Macbeth*:

Life's but a walking shadow, a poor player
That struts and frets his hour upon the stage
And then is heard no more. It is a tale

Told by an idiot, full of sound and fury,
Signifying nothing [Act 5, scene 5, lines 19–28].

Faulkner's allusion to these lines in the title of his novel is immediately relevant to the interpretation of the first part of the novel, which presents a story told by a mentally retarded man. Shakespeare's famous metaphor is one version of a series of metonymically related metaphors that are all highly conventional, including *life is a play*, *life is a player*, and *life is a stage*. Consider Shakespeare's contemporary, Sir Walter Raleigh:

What is our life? A play of passion,
Our mirth the musicke of division,
Our mothers wombs the tyring houses be,
Where we are drest for this short Comedy,
Heaven the Judicious sharpe specatator is,
That sits and markes still who doth act amisse,
Our graves that hide us from the searching Sun,
Are like drawne curtaynes when the play is done,
Thus march we playing to our latest rest,
Onely we dye in earnest, that's no Jest [Raleigh, *What is our life* (1612)].

The metaphor underlying Raleigh's poem is metonymically related to the more famous one produced by Shakespeare, and both may be seen as variations on a conventional theme in the Renaissance. This points to a cultural basis of metaphorical themes and their conventional and stylistically charged expression.

The complicated relation between conventional metaphor from previous periods and present-day allusion and intertextuality may be demonstrated with reference to the 20th-century song by Elvis Presley, *Are you lonesome tonight?* There is a parlando part in the song that begins "Someone said that life is a stage," and then continues by telling a sad love story that is divided into acts, and ends with an empty stage. The question arises whether Elvis has picked up on Raleigh, or Shakespeare, or on some other, intermediary source; or whether *life is a stage* has become part of the folklore of the English-language speech community. That this is not an isolated coincidence is shown by the possibility of a comparable relation between Shakespeare's famous *Juliet is the sun* and the following line from a hit song by British rock band, The Cream: "you're the sun, and as you shine on me, I feel free."

Even more complex possibilities for intertextual stylistic play are suggested by potential allusions to the cognitive-linguistic or metaphorological literature. Thus, Julian Barnes, in his novel *Metroland*, had a chapter called 'Sex is travel,' which comes suspiciously close to *LOVE IS A JOURNEY*, the favorite example from Lakoff and Johnson's *Metaphors we live by*, which was published in the same year, 1980.

The content of Barnes's chapter, however, reveals that this idea can also be interpreted as metonymic rather than metaphoric, in that sex is not similar to a journey but requires travel to the beloved.

Another, similarly innovative stylistic exploitation of a metaphor familiar from the theoretical literature is offered by Michel Faber, in his fantasy/science-fiction novel *Under the skin*. One of the characters utters the following words: "A butcher has to be a bit of a surgeon you know." This is a deliberate perversion of the directionality of a metaphor that has received a lot of attention, *this surgeon is a butcher*. However, its perversion is extremely functional in the situational context of the novel, in which people are treated like cattle and are fed and slaughtered for future consumption by a group of aliens – alien butchers of humans having indeed to be something like surgeons.

These phenomena can all be seen as forms of uptake of a specific metaphor by another language user. This may also occur in more direct and reciprocal forms of discourse, such as ongoing conversations. Interlocutors may take up metaphors on the spot, as it were, for purposes of acceptance or rejection, extension, and development, and for sincere, as opposed to perverse, exploitation. Cameron (2003), for instance, shows how students can immediately repeat and extend metaphors offered by teachers during oral expositions in classrooms.

Metaphorical Patterns

Moving away from the stylistic importance of metaphor for specific utterances, there are also more general patterns of metaphorical style, which may relate to the style of an individual language user. A number of examples may be given from the domain of literature (see Steen and Gibbs, 2004). For instance, Elena Semino has shown how the metaphorical aspects of the mind styles of two fictional characters, Bromden in Ken Kesey's *One flew over the cuckoo's nest* and Clegg in John Fowles's *The collector*, display different properties: Bromden's language uses conventional metaphor in creative ways, whereas Clegg's metaphorical language contains many idiosyncratic metaphors. Another area would be the style of a fictional narrator, such as the narrator of George Orwell's *Nineteen eighty-four*, studied by Anne-Marie Simon-Vandenberg; the narrator uses animal, physical force, and liquid metaphors to express the lack of consciousness and liberty in a totalitarian world. Metaphorical style may also pertain to the language use of an entire work, as has been shown by Don Freeman for a number of Shakespearean plays. This suggests that the personal style of the complete works of individual authors may display

specific patterns of metaphorical usage, as may be the case for heavily metaphorical writers such as Salman Rushdie, as opposed to authors who are clearly much less metaphorical, such as Ernest Hemingway. It will be self-evident that such patterns may also be found in the language of nonliterary writers or speakers, such as famous philosophers or politicians (e.g., Jäkel, 1997; Charteris-Black, 2004), but these have received much less attention.

Style can also be regarded as the language typically used for a particular class of discourse, as opposed to an individual's imprint on the structures of their language use. One of the most famous cases involving metaphor is the one of metaphysical lyrical poetry, which is characterized by the use of daring metaphorical conceits. These are identified by their combination of a specific form, in that they are often presented as analogies or even full-blown arguments, with a particular content, which seems to force the difference between the two domains on the reader more than their fragile and often strained similarity. Here is an example from John Donne, in his poem to Mr Rowland Woodward:

Like one who'in her third widowhood doth professe
Her selfe a Nunne, tyed to retirednesse,
So'affects my Muse, now, a chaste fallownesse [Donne,
To Mr Rowland Woodward (~1635)].

It should be noted how some stylisticians might actually object to calling these lines a metaphor, since they have the form of an analogy that may also be classified as an extended nonliteral comparison. However, the presence of an underlying cross-domain mapping cannot be contested, so that these lines do count as metaphorical in the conceptual sense of the word.

A similarly famous case is constituted by imagist poetry, wherein almost arbitrary external resemblance between entities motivates metaphorical projection from source to target domain. One of the most famous examples is the following poem by Ezra Pound:

The apparition of these faces in the crowd:
Petals on a wet, black bough [Pound, *In a station of the metro* (1913)].

Here, too, questions may arise about the rhetorical classification of the form as a metaphor; however, its conceptual status as a cross-domain mapping is again beyond doubt.

There are also subgenres of the novel that contain characteristically specific manifestations of metaphor in their style. Hardboiled detectives, for instance, typically contain a macho private investigator who revels in producing roughshod analogies portraying women, or more generally their view of emotional

situations. Philip Kerr's *Berlin noir* trilogy provides a goldmine of metaphors, such as in the following example:

Impatient of her, I snatched her knickers down, pulling her onto the bed, where I prised her sleek, tanned thighs apart like an excited scholar opening a priceless book. For quite a while I pored over the text, turning the pages with my fingers and feasting my eyes on what I had never dreamed of possessing [Kerr, *Berlin noir* (1994)].

More generally, David Lodge, following a suggestion made by Roman Jakobson, argued that novels are characterized by the use of simile whereas poetry displays a preference for metaphor (Lodge, 1977).

Poetry and novels are just two genres that display specific patterns of use of particular classes of metaphor. Jakobson and Lodge have postulated many more relationships, and a beginning has been made with the study of the variation of metaphor across registers and domains of discourse. For instance, Kurt Feyaerts has edited a collection of articles on the relation between metaphor and the Bible (Feyaerts, 2003), Lakoff and Johnson's latest work surveys the role of metaphor in philosophy (Lakoff and Johnson, 1999), Reuven Tsur (1987) and Gerard Steen (1994) have addressed the position of metaphor in literature (cf. Steen and Gibbs, 2004), and Lynne Cameron (2003) has examined the use of metaphor in classroom discourse at primary-school age. In the collection on metaphor and thought by Ortony (1993), there is a special section on metaphor in education and another section on metaphor in science, with contributions from Thomas Kuhn and Richard Boyd, among others. Andrew Goatly (1997) has made a beginning with describing some of these relations in stylistic detail, including the distribution of diverging metaphor forms across conversations, news reports, popular science, magazine advertisements, novels, and lyric poems.

Finally, the broadest scope for a stylistic approach to metaphor may define 'style' as the overall impression of a particular language, in contrast with another language. Thus, British English and American English have different patterns of metaphorical usage, one striking feature involving the combination between metaphor and hyperbole in American English (cf. Kövecses, 2004), as may be demonstrated with reference to the frequent exaggerated use in American English of verbs such as *die* and *kill* for many mundane actions, including the light and computers. Different languages can also utilize source domains for particular target domains in very different ways. Variation of metaphor within and between languages is turning into a new area of interest for linguists and stylisticians alike (Kövecses, 2004).

Metaphors and Conceptual Blending

S Coulson, University of California, San Diego,
CA, USA

© 2006 Elsevier Ltd. All rights reserved.

'Metaphor' was defined by Aristotle (*Poetics* XXI, 1457b) as "... giving the thing a name belonging to something else, the transference being ... on the grounds of analogy." More succinctly, Quintilian (VIII, VI, 1) defined metaphor as "the artistic alteration of a word or phrase from its proper meaning to another." Traditionally, then, metaphor is defined as a 'trope,' a nonstandard meaning used for its literary effect. On this view, any cognitive significance attributed to metaphorical phenomena is of a negative character. Hobbes (*Leviathan*), for example, argued that metaphors are "... *ignes fatui*; and reasoning upon them is wandering amongst innumerable absurdities ..."

In contrast to the view of metaphor as a literary curiosity, cognitive semanticists such as Lakoff and Johnson (1980), Sweetser (1990), and Turner (1991) have argued that metaphor is a pervasive phenomenon in everyday language and, moreover, that it represents the output of a cognitive process by which we understand one domain in terms of another. Cognitive linguists define metaphor as reference to one domain with vocabulary more commonly associated with another domain. Thus construed, metaphoric language is the manifestation of conceptual structure organized by a 'crossdomain mapping': a systematic set of correspondences between two domains, or conceptual categories, that results from importing frames or cognitive models from one domain to another.

Conceptual Metaphor Theory

In 'conceptual metaphor theory,' metaphorical expressions are the linguistic manifestation of underlying conceptual knowledge. Whereas traditional approaches have tended to consider metaphorical uses of words and phrases on a case-by-case basis, cognitive linguists have pointed to patterns in the metaphorical uses of word meanings. For example, in (1) through (4) we see a number of examples that employ words whose literal meaning concerns the domain of vision, used metaphorically to characterize the domain of understanding. In such cases, the real topic of discussion (e.g., understanding) is known as the 'topic' or 'target' domain, while the domain characteristically associated with the vocabulary (e.g., seeing) is known as the 'vehicle' or 'source' domain.

- (1) The truth is *clear*.
- (2) He was *blinded* by love.
- (3) His writing is *opaque*.
- (4) I *see* what you mean.

In these and many such examples of this metaphoric mapping, the relationship between the domains is systematic: if seeing corresponds to understanding, then not seeing corresponds to not understanding, faulty vision corresponds to faulty understanding, and so forth. In conceptual metaphor theory, the systematic nature of the relationships between domains in the metaphor results from mapping cognitive models from one domain onto counterparts in the other. This results in a transfer of images and vocabulary from the source domain onto the target. Moreover, it also involves the projection of inferential structure so that inferences from the source domain can be translated into parallel inferences and counterparts in the target. For instance, in the SEEING domain, if someone is 'blinded' he will be unable to see. Analogously, in the KNOWING domain, if someone is 'blinded' he will be unable to apprehend certain sorts of information. For this reason, metaphor is considered a conceptual phenomenon, rather than merely a lexical one.

Viewing metaphorical language as a manifestation of the conceptual system explains why the correspondences between elements and relations in the two domains of a metaphor are systematic rather than random. Cognitive linguists argue that the systematicity in the usage of source and target domain terminology derives from the fact that some of the logic of the source domain has been imported into the target in a way that maintains the mappings from one to the other. Consequently, there are parallels between the source and target domains, both in word meanings and in the inferences that one might draw from sentences that use those word meanings. Although the objective features of the two domains in a metaphor are often quite different, the two domains can be seen as sharing abstract similarities.

Analyses of conceptual metaphors are typically stated in terms of the domains that are associated by the metaphor. The domain of vision, for instance, is metaphorically linked with the domain of knowledge and understanding. Consequently, these utterances are said to be instances of the KNOWING IS SEEING metaphor. Alternatively, metaphors can be described in terms of the high-level mapping between the two domains, as in Seeing → Knowing (Table 1). The latter notation is especially useful when the analyst

Table 1 Example of domain mapping

Seeing		Knowing
Seer	→	Knower
Thing seen	→	Topic of understanding
Quality of vision	→	Quality of understanding
Visual ability	→	Intelligence

wants to outline the correspondences between the two domains.

Conceptual metaphors such as KNOWING IS SEEING make up a pervasive repertoire of patterns in language and thought. The many expressions we can remember or create that conform to the pattern have been taken as evidence that, just as the metaphoric meanings of many of these words are conventional, so too are the metaphoric mappings. Consequently, a lexical analysis of metaphor is not complete unless it refers to the underlying mapping patterns.

The idea that knowledge of metaphoric mappings constitutes part of the linguistic competence of the speaker is supported by the use of conceptual metaphors in novel, poetic language (Lakoff and Turner, 1989). For example, in *To the lighthouse*, one of Virginia Woolf's characters describes moments of insight as "illuminations, matches struck unexpectedly in the dark." Although many of the linguistic expressions in this excerpt are creative, the conceptual mappings conform to the pattern in the KNOWING IS SEEING metaphor. Just as a match affords the possibility of seeing one's surroundings for a brief period of time, a moment of insight allows one to understand something for a brief moment of time. The seer in the match scenario corresponds to the knower, and the quality of vision corresponds to the quality of understanding.

Higher-Level Mappings

In addition to KNOWING IS SEEING, cognitive linguists have identified a large number of conventionalized metaphors, such as DESIRE IS HUNGER (*sex-starved*, *sexual appetite*), HOPE IS LIGHT (*dim hopes*, *ray of hope*), or LOVE IS A JOURNEY (*we've come a long way together*, *their marriage is going off-track*, *we're just spinning our wheels*) (see Lakoff and Johnson, 1980, 1999). That is, there are many expressions about desire, hope, and love that systematically exploit vocabulary from the domains of hunger, light, and journeys, respectively. As noted earlier, the systematicity derives from the fact that the mappings between elements in the source and the target domains are typically constant from expression to expression, and that many source domain inferences map onto analogous target domain inferences.

Moreover, many conventionalized metaphors such as LOVE IS A JOURNEY can themselves be seen as instantiations of more general crossdomain mappings. LOVE IS A JOURNEY, along with A CAREER IS A JOURNEY and even LIFE IS A JOURNEY, are all instantiations of a more general mapping between long-term purposeful activities and progress along a path. Indeed, the latter is part of a very abstract mapping scheme known as the 'event structure metaphor' (Lakoff, 1993; Lakoff and Johnson, 1999). As outlined by Lakoff (1993), the event structure metaphor includes the mappings outlined as follows.

States	→	Locations
Changes	→	Movements
Causes	→	Forces
Actions	→	Intentional movements
Purposes	→	Destinations
Means	→	Paths
Problems	→	Impediments to motion

Particular metaphoric expressions such as *dead-end relationship* can thus be seen as motivated by metaphoric mappings at multiple levels of abstraction (LOVE IS A JOURNEY, LONG-TERM PURPOSEFUL ACTIVITIES ARE JOURNEYS, and the event structure metaphor).

Primary Metaphor and Experiential Grounding

One important claim in conceptual metaphor theory is that 'primary metaphors' are grounded in correlations in experience. For example, the metaphorical mapping between quantity and height (MORE IS UP) is thought to be motivated by correlations between the number of objects in a pile and its height, or the amount of liquid in a glass and the height of the fluid level. In traditional accounts dating back to Aristotle, metaphors were based on similarities between the two domains invoked in the metaphor. By contrast, Lakoff and Johnson (1980) highlighted the existence of a large number of metaphorical expressions, such as *big idea*, whose two domains have no inherent similarities, arguing instead that such metaphors are experientially motivated.

The experiential motivation of metaphors is consistent with the fact that the mapping between the domains and entities in a primary metaphor is directional. For instance, although the conceptual metaphor KNOWING IS SEEING allows us to utter an expression such as *I don't see what you're saying* to indicate the existence of a comprehension problem, it does not license *I don't understand your face* to indicate a problem with visual acuity. Directionality is thought to reflect the underlying cognitive operations in metaphor, in which an experientially basic source domain is exploited to reason about a more abstract

target domain. Indeed, many entrenched metaphors involve the use of a concrete source domain to discuss an abstract target. For example, importance is expressed in terms of size (as in *big idea* or *small problem*), similarity is construed as physical proximity (as in *close* versus *disparate* philosophical *positions*), and difficulties are discussed in terms of burdens (as in *heavy responsibilities*).

Primary metaphors originate in *primary scenes* in which critical aspects of the source and target domains cooccur with one another. For example, the KNOWING IS SEEING metaphor is thought to be motivated by contexts in which visual experience brings about understanding. In fact, corpus research shows that child-directed speech contains many utterances in which both the perceptual and the cognitive meaning of *see* are simultaneously present as in (5) (Johnson, 1999).

(5) Oh, I see what you wanted.

In fact, children produce many such utterances themselves, prompting the suggestion that the meaning of words such as *see* evidences ‘conflation,’ as the word refers simultaneously to the visual and the cognitive experience. Learning the metaphorical meaning is not a matter of generalizing from a concrete meaning to an abstract one, but rather requires ‘deconflation,’ in which the child gradually dissociates and distinguishes between the two domains in the metaphor (Johnson, 1999).

Primary metaphors such as KNOWING IS SEEING are directly grounded in experience, while other metaphors are only indirectly grounded. For example, the THEORIES ARE BUILDINGS metaphor is supported by examples like (6) to (8) from Grady (1997), in which theories are discussed with verbiage that might appropriately be applied to buildings.

- (6) You have failed to buttress your arguments with sufficient facts.
- (7) Recent discoveries have shaken the theory to its foundations.
- (8) Their theory collapsed under the weight of scrutiny.

However, it is unlikely that many people have correlated experiences of theories and buildings. Moreover, many experientially basic aspects of our concepts of buildings are not exploited in this metaphor, as in (9) and (10) (Grady and Johnson, 2002).

- (9) This theory has no windows.
- (10) I examined the walls of his theory.

Instances in which source domain language (in this case pertaining to buildings) has no target domain

interpretation reveal ‘metaphorical gaps.’ Primary metaphors, however, do not evidence these gaps, as virtually any word that is meaningful in the source domain can be metaphorically interpreted in the target domain (Grady, 1999). Consequently, Grady (1997) suggested that the THEORIES ARE BUILDINGS mappings that underlie (6) through (8) arose from a combination of two primary metaphors: ORGANIZATION IS PHYSICAL STRUCTURE and PERSISTING IS REMAINING ERECT. Unlike the proposed mapping between theories and buildings, experiential grounding of a mapping between persistence and remaining upright is quite plausible (Grady, 1999).

Conceptual Blending Theory

Much of the linguistic data accounted for by conceptual metaphor theory can also be analyzed in terms of ‘conceptual blending theory’ (Fauconnier and Turner, 2002). An elaboration of ‘mental space theory’ (described later), the conceptual blending framework (also known as ‘conceptual integration’ and ‘blending theory’) assumes many of the same claims as conceptual metaphor theory, such as the idea that metaphor is a conceptual as well as a linguistic phenomenon and that it involves the systematic projection of language, imagery, and inferential structure between domains. However, in contrast to the emphasis on conventional metaphors in conceptual metaphor theory, conceptual blending theory is intended to capture spontaneous, online processes that can yield short-lived and novel conceptualizations. Furthermore, blending theory reveals connections between the cognitive underpinnings of metaphor and a variety of other linguistic phenomena handled by mental space theory.

Mental Space Theory

Mental space theory (Fauconnier, 1994) is a theory of referential structure, a level of conceptual organization between the situation being described and the linguistic structures that describe it (Langacker, 1993). Although motivated by linguistic data, mental spaces are not specifically linguistic in nature and reflect the operation of more general cognitive processes. In this framework, words do not refer directly to entities in the world. Rather, linguistic cues prompt speakers to set up elements in a referential structure that may or may not refer to objects in the world. Created to solve semantic problems created by referential opacity and indirect reference, mental spaces can be thought of as temporary containers for relevant information about a particular domain.

A mental space contains a partial representation of the entities and relations of a particular scenario as perceived, imagined, remembered, or otherwise understood by a speaker. This representation typically includes elements to represent each of the discourse entities, and simple frames to represent the relationships that exist between them. Mental space theory deals with many philosophical problems of meaning by employing multiple spaces to represent a single sentence. Although different spaces can contain disparate information about the same elements, each individual space is internally coherent, and together they function to represent all of the relevant information. In contrast to traditional approaches to meaning construction, the bulk of the cognitive work involves tracking the mappings between spaces rather than the derivation of a logical representation of sentence meaning.

- (11) Orlando Bloom is the new James Bond.
 (12) Iraq is the new Vietnam, as protests return to the airwaves.
 (13) The new James Bond wears jewelry everywhere he goes.

In the context of a newspaper article about the signing of British actor Orlando Bloom to play the character James Bond in an upcoming spy movie, example (11) prompts the construction of two mental spaces, one for reality and one for the movie. Element *a* represents Orlando Bloom in the reality space, while element *a'* represents James Bond in the movie space. An 'identity' mapping between *a* and *a'* represents the fact that in this context *a* and *a'* are the same person, even though Orlando Bloom the actor may not share all of his character James Bond's qualities.

Reality		Movie
a	→	a'
Bloom (a)		Bond (a')

In the context of an article about the increasing involvement of musicians in antiwar protests, (12) prompts the construction of two mental spaces: one for 2004 and one for 1970. Element *w* represents the American war with Iraq in the 2004 space, whereas element *w'* represents the American war with North Vietnam in the 1970 space. The link between these two elements is not identity, but rather **analogy**. Similarly, there is an analogy link between the contextually evoked protests in the 1970 space (*p'*) and the explicitly evoked protests in the 2004 space (*p*).

2004		1970
w	→	w'
p	→	p'
Location (w, Iraq)		Location (w', Vietnam)

Once elements in different mental spaces are linked by a mapping, it is possible to refer to an element in one space by using language more appropriate for the other space. For example, one might utter (13) to convey Orlando Bloom's penchant for wearing necklaces. As in (11), (13) would involve the construction of two mental spaces: one for reality and one for the movie. Element *b* stands for Bloom in reality space, whereas *b'* stands for Bond in movie space, and (given that wearing jewelry is unlikely for the very macho James Bond character) the predicate wears-jewelry pertains to *b* and not *b'*. Thus, in (13), the speaker refers to *b* (Bloom), only indirectly by naming its counterpart *b'* (Bond). In mental space theory, the possibility of using a term from one space to refer to a linked element in another domain is known as the 'access principle.'

Reality		Movie
b	→	b'
Bloom (b)		Bond (b')
Wears-Jewelry (b)		

The access principle is in fact central to the account of metaphor in mental space theory.

- (14) Paris is the heart of France.
 (15) The heart of France is under attack.

On Fauconnier's (1994) account, a metaphor such as (14) is handled by setting up two mental spaces: one for the source domain (anatomy) and one for the target (geography).

Anatomy		Geography
Heart	→	Paris
Body	→	France

The *heart* is linked to *Paris*, and the *body* is linked to *France* by analogy mappings. Once these spaces are linked, one can refer to Paris as *the heart of France*, as in (15). Moreover, as in conceptual metaphor theory, cognitive models that detail the importance of the heart to sustaining the body are cognitively accessible to the target domain and can be mapped onto target space counterparts.

Conceptual Blending and Metaphor

Fauconnier and Turner (1998) suggested that metaphoric mappings were one manifestation of a more general integration process that crucially involved the construction of blended mental spaces. 'Blended spaces' are mental spaces that are built up online to incorporate information from different frames, as well as local contextual information. Central to conceptual blending theory is the notion of the 'conceptual integration network,' an array of mental spaces

in which the processes of conceptual blending unfold (Fauconnier and Turner, 1998). These networks consist of two or more input spaces structured by information from discrete cognitive domains, a generic space that contains structure common to the inputs, and a blended space that contains selected aspects of structure from each input space along with any emergent structure that arises in the course of comprehension. Blending involves the establishment of partial mappings between cognitive models in different spaces in the network and the projection of conceptual structure from space to space.

One motivation for blending theory is the observation that metaphoric expressions often have implications that do not appear to originate in either the source or the target domain. For example, although neither butchers nor surgeons are customarily considered incompetent, a surgeon metaphorically described by his or her colleagues as a *butcher* does not have a good reputation. In blending theory, appreciating this metaphor involves establishing mappings between elements and relations in the source input of butchery and the target input of surgery. As in conceptual metaphor theory, there is a mapping between surgeon and butcher, patient and dead animal, as well as scalpel and cleaver.

However, blending theory also posits the construction of a blended space in which structures from each of these inputs can be integrated. In this example, the blended space inherits the goals of the surgeon and the means and manner of the butcher (Grady *et al.*, 1999). The inference that the surgeon is incompetent arises when these structures are integrated to create a hypothetical agent with both characteristics. Behavior that is perfectly appropriate for a butcher whose goal is to slaughter an animal is appalling for the surgeon operating on a live human being. **Table 2** shows the conceptual integration network for *That surgeon is a butcher*. The fact that the inference of incompetence does not originate in the source domain of butchery is further suggested by the existence of other metaphoric uses of *butcher* – such as describing a military official as *the butcher of Srebrenica* – that recruit structure and imagery from the butchery domain but do not connote incompetence. Differences in the implications of the butcher metaphor in the domains of medicine and the military highlight the need for an account of their underlying conceptual origin.

Blending can also be used to explain how the target domain influences the meaning of metaphoric expressions. For example, the metaphoric idiom *digging your own grave* is used to imply that someone is unwittingly contributing to their own failure. While this metaphor depends on conventional metaphoric mappings between death and failure, the meaning of

Table 2 Example of conceptual integration network

<i>Surgeon Input space</i>	<i>Blended Space</i>	<i>Butcher Input space</i>	<i>Generic Space</i>
Surgeon	S/B	Butcher	Agent
Patient	P/A	Animal	Patient
Scalpel	S/C	Cleaver	Cutting instrument
<i>Goal:</i> Heal patient	<i>Goal:</i> Heal patient	<i>Goal:</i> Kill animal	
<i>Means:</i> Precise cuts	<i>Means:</i> Slashing cuts	<i>Means:</i> Slashing cuts	
	<i>Emergent inference:</i> Incompetent (S/B)		

the metaphor in the target domain does not seem to result from a straightforward projection from the source domain of grave digging. If the target domain concerns a case where one's ill-advised stock purchases lead to financial ruin, the digger maps onto the purchaser, the digging maps onto the purchasing, and the digger's death maps onto the purchaser's financial ruin. However, note that in the realistic domain of grave-digging, there is no causal relationship between digging and the grave-digger's death. The blended space thus invokes its imagery from the source input space but obtains its causal structure from the target input (Coulson, 2001; Fauconnier and Turner, 2002).

Furthermore, unlike metaphor theory, which attempts to explain generalizations in metaphoric expressions via the conceptual mappings that motivate them, conceptual blending theory attempts to explain meaning construction operations that underlie particular metaphoric expressions. Consequently, blending theory can address the meaning construction in metaphoric expressions that do not employ conventionalized mapping schemes. For example, the italicized portion of this excerpt from an interview with philosopher Daniel Dennet involves a metaphorical blend: "There's not a thing that's magical about a computer. *One of the most brilliant things about a computer is that there's nothing up its sleeve*" (Edge 94, November 19, 2001). The input domains here are *computers* and *magicians*, and the blend involves a hybrid model in which the computer is a magician. However, the connection between these two domains arises purely from the cotext of this example, as there is no conventional COMPUTERS ARE MAGICIANS mapping in English.

Blending also can be used to explain how a number of different kinds of mappings can be combined to

explain the meaning of a particular example such as (16) (from Grady *et al.*, 1999).

- (16) With Trent Lott as the Senate Majority Leader, and Gingrich at the helm in the House, the list to the Right could destabilize the entire Ship of State.

This example involves an elaboration of the conventional Nation-as-Ship metaphor, in which the Nation's policies correspond to the ship's course, leadership corresponds to steering the ship, and policy failures correspond to deviations from the ship's course. The Nation-as-Ship metaphor is itself structured by the more abstract event structure metaphor. The source input is the domain of Ships, which projects an image of a ship on the water, as well as the concept of the helm, to the blended space. The target input is the domain of American politics, which projects particular elements, including the (Republican) politicians Trent Lott and Newt Gingrich, to the blend, where they are integrated with the sailing scenario.

Example (16) describes the ship listing to the right. However, in the realistic domain of ships, neither the presence of one individual (Trent Lott) nor the beliefs of the helmsman are likely to cause the ship to list. The logic of this metaphoric utterance comes not from the source input but rather the target input in which the Senate Majority Leader and the Speaker of the House can affect national policies and the overall political orientation of government. Furthermore, the standard association between conservatism and the right as against liberalism and the left is clearly not based on the ship model, as it is frequently encountered in other contexts. However, because the scenario in the blend involves spatial motion, the literal notion of rightward movement is integrated with the other structure in the blend to yield a cognitive model of a ship piloted by Newt Gingrich that lists to the right.

Consequently, Fauconnier and Turner (2002) proposed that metaphoric utterances are mentally represented in networks of mental spaces known as 'integration networks.' As noted earlier, conceptual integration networks are comprised of four mental spaces. The source and target domain each structure one input space; the generic space represents abstract commonalities in the inputs; and the blended space inherits structure from its inputs as well as containing emergent structure of its own. Rather than emphasizing the extent to which metaphorical utterances instantiate entrenched mappings between source and target domains, conceptual integration networks only represent those cognitive models that are particularly relevant to the mapping supported by the utterance. While mappings in the integration

network require knowledge of conceptual metaphors, such as KNOWING IS SEEING, blending theory is best suited for representing the joint influence of input domains and the origin of emergent inferences in particular metaphoric utterances.

Metaphor, Conceptual Blending, and Linguistic Theory

In part because of its origin in mental space theory, conceptual blending theory suggests that the meaning construction operations that underlie metaphoric meanings are but a subset of those involved in other sorts of indirect reference. By treating all sorts of mappings as formally identical, it is possible to understand the transfer of structure in metaphor as being fundamentally similar to the transfer of structure in nonmetaphorical instances. Thus, regardless of whether or not the information being combined originates in different domains, the integrative operations can be understood as requiring the construction of mappings between partial structures that originate in different mental spaces.

This formal identity allows for the unification of the treatment of metaphor – which principally recruits analogy mappings – with the treatment of 'counterfactuals' and 'conditionals,' conceptual blends that often recruit identity mappings. A number of researchers working within the framework of conceptual blending have addressed its implications for counterfactuals (e.g., Coulson, 2000; Fauconnier, 1997; Oakley, 1998). Similarly, the formal treatment of all sorts of mappings is useful in explaining the variety of complex combinations coded for by modified noun phrases. For example, blending theory has been used to explore issues of noun modification in seemingly simple cases like *red pencil* (Sweetser, 2000), more exotic cases like *land yacht* and *dolphin-safe tuna* (Turner and Fauconnier, 1995), and privative constructions such as *alleged affair* and *fake gun* (Coulson and Fauconnier, 1996).

The most obvious application of conceptual metaphor and blending theory, however, is in lexical semantics, or the study of word meaning. The pervasiveness of metaphoric meanings suggests that metaphoric extension is a major factor in the emergence of new senses, and thus plays an important role in 'polysemy'. Polysemy is the phenomenon in which a single word form has many related senses, as in *cut paper*, *cut the budget*, and *cut corners*. Because most words have an array of interrelated senses, metaphor and blending can be used to explain how these different senses can be seen as extensions and elaborations that arise as a function of different contextual circumstances.

Another productive process for creating word senses is 'metonymy,' in which words are used to refer to concepts closely related to their more customary referents (see **Metonymy**). For example, in (17), *Shakespeare* refers not to the man, but to the plays authored by the man. Similarly, in (18), *the White House* refers not to the building but to the people who work in the building.

(17) Kenneth loves Shakespeare.

(18) The White House never admits an error.

The interaction of metaphor and metonymy has recently emerged as a major focus of research in cognitive linguistics (see, e.g., Dirven and Poerings, 2003).

Accounts of both metaphor and metonymy are important for the study of how meanings change over time (Sweetser, 1990; Traugott and Dasher, 2001). Conceptual metaphor theory can identify conventional mapping schemes, such as the event structure metaphor, to describe patterns of semantic change, and the experiential grounding of primary metaphors might help explain why some patterns are more pervasive than others. Moreover, conceptual blending theory, with its capacity to describe the integration of general knowledge and contextual circumstances, might be used to address historical, social, and psychological causes of semantic change.

Metaphors in Political Discourse

P Chilton, Lancaster University, UK

© 2006 Elsevier Ltd. All rights reserved.

Everyone knows that politicians use language in ways designed to persuade, and perhaps deceive, and some people would include ‘metaphors’ as examples of political rhetoric. It is important to be clear what is understood by the term ‘metaphor.’ In the first part of this article we outline the traditional understanding and then the contemporary cognitive theory of metaphor. In the second part we apply the latter to examples of political discourse, specifically discourse about political institutions, showing how a scientific understanding of metaphor can yield insights into what humans are doing when they reason about politics.

The Classical Tradition

Greek and Roman thinkers were well aware that language was integral with politics and public life in general and studied it under the rubric of ‘rhetoric.’ Their writings on the subject to some extent seek to explain metaphor (among many other rhetorical devices) as a phenomenon of human communicative behavior, but they were far more concerned with evaluating the persuasive or esthetic effects of metaphors with a view to advising public speakers.

Aristotle, however, has a theoretical framework. He defines metaphor as ‘the application of a word that belongs to another thing’ (Aristotle, 1995: 21) and discerns different types of such application. For Aristotle, then, metaphor is about the use of words, not about the nature of thought. Moreover, Aristotle thought of metaphor as something exceptional. In *Rhetoric* he is above all concerned with the emotive effects caused by metaphor and by the ‘correct’ choice of metaphors. He regards metaphor as special to certain forms of writing and speaking and to certain talented individuals. These ideas, repeated by classical writers such as Cicero and Quintilian, are implausible in the light of modern research on metaphor. Aristotle does note the role of metaphor in the expressing of new ideas, but others concentrated on functions such as being brief, and avoiding

obscenity and eulogistic embellishment. In fact, the tendency is to reduce the prominence of metaphor and to handle it with a fair degree of suspicion.

This stance is inherited and magnified by the early modern philosopher and pivotal political theorist Thomas Hobbes (cf. Chilton, 1996). Here is Hobbes on metaphor: “Metaphors, and senseless and ambiguous words, are like *ignes fatui*; and reasoning upon them, is wandering amongst innumerable absurdities; and their end, contention, and sedition, or contempt” (*Leviathan*, chapter 5, pp. 116–7, original emphasis). In this passage it becomes clear that for Hobbes metaphor may actually be a kind of threat to the political status quo. This should at least alert us to the possibility that metaphors play a very important role in political life.

The Cognitive Theory of Metaphor

In the 1980s linguists realized that metaphor was not simply a matter of transferring a word from its ‘proper’ referent to some other referent, nor a special use of language confined to the literary or oratorical domains (cf. Lakoff and Johnson, 1980, 1999). The following points are essential for any serious investigation of ‘metaphor in political discourse.’

First, metaphor is a cognitive, not a linguistic phenomenon. The human mind has various forms of organized knowledge. These may be innate or partly innate and elaborated by culture-relative experience. Let us call these ‘domains.’ Metaphor is then defined as a mapping from a source domain of this type to a target domain. The evidence suggests that many source domains tend to be based in physical, especially spatial, experience and be stored in the mind as what are often referred to as ‘image schemas.’ What the metaphorical mapping does is transfer structure from the source domain to a less well-specified domain.

Second, it is apparent that such metaphorical mappings account for the meanings of many ordinary words in a language as well as idiomatic expressions. Metaphors are therefore not confined to special genres. However, in political discourse, as in other types of discourse, particular words and idioms will obviously

be relevant, so particular metaphors will be also. We will see that certain image schemas are an important source of political concepts, e.g., the source–path–goal schema and the container schema. An important point to be made here is that metaphors are actually an instrument for reasoning, contrary to what was asserted by Hobbes. They provide a means by which the human mind can make inferences, for if metaphors map structure from a source domain to a target domain, inferences that can be done in the source domain can (potentially) be done in the target domain.

Another methodological consideration concerns the etymology of political vocabulary. In English and some other languages many words for political phenomena derive from Latin or Greek words with different meanings. Meaning change in general is often metaphorical in the sense defined here. In the case of political words the metaphors involved can be of interest because they give some indication of how the human conceptual system operates over historical time in this domain of human life.

Finally, two caveats are in order. First, this article refers primarily to metaphor in political discourse in English. Second, it refers to the Western political tradition. Whether the points made can be generalized is a question for further research.

Metaphor and Politics

Political behavior involves using language as a form of political action and as a form of reflection on (metarepresentation of) political behavior. The two are not of course entirely separate but in what follows we shall focus on the second. What, then, are the political concepts that have a metaphorical basis?

If we make the assumption that political behavior involves both cooperation and competition, we can ask how metaphor is involved in the conceptualizing of this duo. It is clear that the relevant concepts will concern differentiation of various sorts and the relations among the parts. Relations of power will be especially significant.

The basic vocabulary of hierarchy and precedence is derived metaphorically from spatial concepts. Two of the fundamental image schemas are the front–back schema and the up–down schema, based on human anatomy, perception and cognition.

The front–back schema gives us metaphorical mappings for precedence (the word itself being etymologically metaphorical [*Latin prae-cedere* go in front of] and related to physical ordering of individuals in procession). This is why we speak of an individual or group coming **before**, in **front** of, **ahead** of, in the **vanguard**, etc., while others **come behind**, **fall behind**, **follow**, etc. It will be noticed that these expressions

contain mappings from additional image schemas. One of these is the path schema, which reflects experience of human movement. Front–back combined with path gives us the powerful concept of **leadership** and **followers**. In certain political discourses, such concepts are applied to whole groups (ethnic groups, states, regions) in expressions such as ‘**backward** nations’; indeed the concept of **progress** itself is etymologically derived (*Latin pro-gressus* a forward move) from the spatial front–back and path schemas. In persuasive political discourse, orators frequently claim that their country is, or urge that it should be, **moving forward**. In fact, this schema appears to be indispensable for the meanings associated with one important strand of political discourse, namely reference to policy and future planning. Politicians and their bureaucrats thus frequently speak and write of **looking toward the future**, **taking rapid steps**, **moving on**, coming to a **crossroads**, **going in the right direction**, and so on.

In the up–down schema, **up** maps onto good, strong and powerful. Thus superior individuals or groups are not only better in some normative sense, but also possess power **over** others. These expressions are embedded in the language and enter into systematic semantic relations. Thus if someone is **over** or **above** you, you are **beneath** or **below** them; you will be **subordinate**, **inferior**, and they may **stoop**, **condescend**, and so on. This network is the basis for further concepts: a group may **rise up**, or cause an **uprising**, and an established authority may **decline**, **fall**, or **collapse**. The basic image schema of standing upright is important to the rather complex development of the concepts evoked by words such as ‘estate’ and ‘state.’

Concepts of control and power are lexically encoded by way of the spatial up–down image schema. This can be seen from the constructions into which the relevant lexical items enter in English and other languages. For example, it is systematically the case that we say power **over**, control **over**, authority **over**, charge **over**, responsibility **over**, and so forth, rather than some other preposition. One of the key concepts of Western political philosophy from the early modern period onward is **sovereignty**. The history of this word, like that of the term ‘state,’ is complex, but what should be noted here is that it is also metaphorically derived according to the up–down schema: *sovereign* < late Latin *superanus* < Latin *super* (‘on top of,’ ‘over’).

The conceptualization of discrete groups of individuals, in many cases in discrete geographical regions, is probably a crucial component of political thinking and action. The form of such concepts is provided by the basic container image schema, which has many politically significant ramifications. The container schema captures human experience of ‘inside,’

'outside' and the intermediate boundary. On the linguistic evidence, it is apparently recruited by the conceptual system to understand, reason about, and communicate about social groups. In reality collections of objects and individuals need not have determinate bounds. The container image schema, however, imposes them. Presumably it coincides with what may or may not be a basic schema, that of self and other. It is this schema that makes it possible to draw inferences such as: if A is not **in** the group, then he is **outside** it; in order to **enter** the group A must cross a boundary. As Chilton (1996) and Chilton and Lakoff (1995) argued, the container schema is fundamental to the concept and discourse of security, as well as to the modern concept of the state and the international system, where countries and regions are conceptualized as container-like entities. Two combinations with other image schemas are worth noting here. In combination with the center-periphery schema, we have political concepts of **central authority** and **remote** or **peripheral regions**. In combination with the path schema, we have what appear to be emotionally charged concepts of invasion, incursion, and the infringement of national boundaries.

In the Western political tradition certain metaphors with cultural (rather than image-schematic) sources for the state have recurred, as Peil (1983) has shown: the body politic, the ship of state, buildings, machines. The first three can be regarded as linked to the container schema, and the body schema involves basic as well as cultural knowledge. All provide rich possibilities for political inferences in the sense outlined earlier.

The body-politic metaphor is particularly entrenched. It permits the mapping of structured knowledge about the body (and its ills) onto the political domain. If the polity has a **head**, it also has its lesser parts that serve it. If the polity is a body, then it may have **disease**, which may be due to an invasive element, e.g., a **parasite**. It follows that it needs a **physician** to **cure** it, who may prescribe a **cure** such as a **purge**. As is well known, this train of thought was developed and manipulated in Nazi thinking and propaganda. Peil's other metaphors provide inferential potential that will be more or less familiar to readers. If the state is a **ship**, it may need a strong **captain** to **steer** it though **rough seas**; if it is a building it will need strong **foundations**, a **roof** to protect it, and **pillars** to hold it up; if it is a **machine**, then there are **levers** of power, the machinery has **checks** and

balances, and it may be more or less **efficient**, or may go **out of control**.

Such examples suggest that the cognitive theory of metaphor provides a means of investigating the intricate conceptual networks that underlie discourse about political institutions. They also suggest that core features of political theory, at least in its traditional Western forms, make use of metaphors derived from a small set of image schemas. But these are hypotheses for future research.

Metapragmatics

C Caffi, Genoa University, Genoa, Italy & University of Lugano, Switzerland

There are at least three senses in which it is possible to speak of metapragmatics. The first, the most general and potentially generic one, refers to the theoretical debate on pragmatics and its central concerns, its epistemological foundations, and the definition of its relevant object and scope. Metapragmatics in this sense concerns itself with the criteria of pertinence of the discipline, not to state which is the 'best' pragmatics, but to verify the consistency of the basic assumptions, the definitions of the questions to be asked, and the methods to be adopted.

The second, narrower sense, highlights the conditions that make speakers' use of language possible and effective. The task of metapragmatics in this sense is, above all, to make those conditions explicit. This kind of metapragmatics, which can be related to the problem of the universals of human communication, is transcendental in a Kantian sense inasmuch it deals with the constitutive elements of human knowledge.

The third sense is less ambitious than the other two. It is concerned with the investigation of that area of the speakers' competence that reflects judgments of appropriateness on one's own and other people's communicative behavior. In this sense, metapragmatics deals with the 'know-how' regarding the control and planning of, as well as feedback on, the ongoing interaction.

The metapragmatic level is not just *one* of the meta-linguistic levels: on the contrary, it is different from them, as the knowledge it refers to concerns not 'the ability to say' but 'the ability to do' (and the ability to say what one does). The metapragmatic level represents the interface between the linguistic and the extra-linguistic: it enables the language user to relate language and world, by checking the adequacy of utterances with regard to actual contexts. The knowledge it incorporates leaves traces on the surface of discourse.

The different meanings of the term 'metapragmatics,' with their corresponding different objects of study, have an etymological justification, as they can be linked to the different meanings of the preposition *metá* in Classical Greek: not only 'above' but also 'beyond.' After all, the term 'metaphysics' is based on a misunderstanding: the volumes by Aristotle entitled *Metaphysics* did not transcend and justify his earlier writings on physics but, simply, because of a chance arrangement, 'came after' the ones on physics.

The paradox of metapragmatics, and also its potential oxymoron, is that it 'comes after', though reflecting on, a knowledge that 'comes before' any theory.

Metapragmatics 1: The Need for Metatheoretical Reflections

Pragmatics has definitely come a long way. From being a 'wastebasket,' to use Bar-Hillel's (1971) well-known metaphor, it has become an accredited discipline with an international association, crowded conferences, textbooks, and a monthly journal. Pragmatics is undogmatic, tolerant, and does not demand acts of faith. The reverse side of this tendentially ecumenical hospitality, however, is the heterogeneity of the theoretical proposals it brings together – something that makes it all the more necessary that the theoretical standpoints and the argumentative strategies be clarified. Nevertheless, an agreement both on an (albeit minimal) definition of the field of pertinence and on the assumption of the ideological and theoretical commitments this definition entails is necessary. To achieve this goal, a metatheoretical awareness is needed. So far, these reflections have mainly been practiced on boundary issues (disciplinary and academic), especially with regard to the often disputed borders of pragmatics with semantics and sociolinguistics. Beyond defining goals – something that was appropriate in the first stages of its development – metatheoretical reflections have a right to autonomy. Clearly, any choice regarding the object of study of pragmatics, its domain and, as a consequence, the choice of the most effective descriptive categories and methods, entails a commitment to a metapragmatic view; this commitment and view, however, are most often neither foregrounded nor even made explicit. At times they are simply missing. Nevertheless, such a concern for the epistemological implications of what researchers assume pragmatics is about, is not only legitimate but also necessary, as pragmatic investigation goes beyond the boundaries of linguistics and overlaps with semiotics. Its object is not language, speech, grammar, but human communication (clearly, all these terms ask for metatheoretical definitions). Its subjects are not speakers, but people making (different types of) interactional choices; the study of the latter requires an integrated conceptual framework.

Last but not least, no justification is needed for speaking about *metapragmatics*; rather, one should ask why one does not commonly speak about *metaphonology*, *metasyntax*, *metasemantics*, and so on.

Wittgenstein (1953) highlighted the constitutional fallacy of any metadiscourse that claims to be foundational, but that is actually just one more linguistic game among many others. Even so, games that consist of asking oneself where the game one is playing comes from, where it leads to, whether its rules have any sense, or if they ought to be changed, are games worth playing. Metapragmatic epistemological reflection is not necessarily transcendental. One way to escape the foundational regression consists in reflecting on how pragmatics speaks about itself, on how it represents itself, on its wording, on its key words, on its predominant metaphors. Much work is needed here. First of all, one has to avoid the risk of new forms of hypostasis (see Borutti, 1984), brought about by certain, apparently harmless, metalinguistic uses. For instance, the use of a definite noun phrase can be idealizing: the risk of an idealization exists whenever one refers to ‘the speaker,’ who could end up by being an hyperuranian subject, or a lunar *effet-sujet*. Hence, the obvious need for a solid empirical and context-sensitive ‘anchorage.’

As noted, pragmatics is tolerant; some would even call it loose. Yet, if one looks at the literature labeled pragmatic, one is struck by the frequency of such words as ‘rules,’ ‘maxims,’ ‘principles.’ From the available data, one tries to infer rules and principles. One could even imagine a (superego-like) need for normalization; a need that is clearly understandable if one considers the messy nature of the object and the need to define analytical instruments with which to infer generalizable results. On the one hand, it is a fact that pragmatic mistakes are much more compromising than grammatical ones: there is nothing worse for an interactant than the *pragmatica sanctio* whereby his/her syntactically and semantically well-structured utterance is inappropriate, ineffective, unhappy, inadequate to his/her wishes and aims. On the other hand, ‘normativeness’ assumes that what is regulated, i.e., the basic units to which rules and regulations apply, is not controversial. But, once again, this is a matter of metatheoretical choice (see Mey, 2001: 176ff.; Verschueren, 2003).

Metapragmatics 2: On the Possibility Conditions of Action and Interaction

Communication

The second type of research that can be labeled ‘metapragmatic’ studies the possibility and felicity conditions of communication. Whereas in other research areas, such as text linguistics, there have been attempts to define the constitutive rules – what makes a text a text, the *quidditas*, rather than the

qualitas of the text, identified in coherence – in pragmatics attention has mostly been given to regulative rules or principles: how to cooperate, be kind, polite, etc. In this regulative sense, traditional rhetoric, as it lists and correlates locutionary and perlocutionary strategies, is a distinguished and sophisticated precedent. One limit of rhetoric is that it ignores the action level of language, defined by Austin as the illocutionary level of a speech act, which can be taken to represent the basic unit of analysis both in conversational analysis and in pragmatic linguistics.

Normativeness, as noted, presupposes that what is normalized is clear. Nevertheless, the following questions remain open. What is constitutive of an action? What is constitutive of an interaction? What must necessarily, not optionally, hold for an action of a certain kind to be performed? What units of action are constitutive of a given interaction?

In this type of metapragmatics, for instance in research on dialogue-constitutive universals, to use Habermas’s (1971) label, the metaphysical risk is particularly tangible. The same risk is encountered in the presumed identification of universal speech acts, particularly if they are transferred onto syntactic units and inflectional moods (the illocutionary acts of statements, questions, and commands as unproblematically reflecting the indicative, interrogative and imperative moods (see *Speech Acts and Grammar*)). The problem of identifying basic acts – whether universal or not, and whether or not associated with specific syntactic forms – is related to the problem of the conventions underlying the performance of an act. In its turn, this problem is linked with the problem of consensus: what is the consensus that allows us to define the interactional sequence *X* as *Y*? Is there a pragmatic common core allowing a cross-cultural comparison of communicative behaviors and, if so, what does it consist of?

Here, a wide and by no means uncontroversial area of research opens up. Shared metapragmatic knowledge concerns knowledge of culture-bound and group-bound action frames. Members of a given community, in a given phase of its history, are able to produce and recognize types of linguistic action, and assign, prospectively or retrospectively, an utterance ‘token’ to a ‘type’ of action, by describing *X* as *Y*. Behind this possibility of performance and recognition of linguistic action one can imagine, in a Kantian fashion, several conditions:

a. *Conditions of ‘thinkability,’* i.e., conditions underlying the possibility of thinking types of actions. These conditions are registered in the lexicon, for instance, as speech act names or illocutionary force indicating devices; they deal with the ‘what is,’

the essence. The most famous attempt to define constitutive rules of speech acts was made by Searle (1969) (*see Speech Acts*). Such attempts can be related to research in Artificial Intelligence (AI) and cognitive psychology, in particular on action frames and on how global patterns are inscribed in the speakers' memory. The major difficulty met by this kind of investigation derives from the fact that there is not just one way to perform an action; neither is there a one-to-one relationship between linguistic form and action type: in short, there is no correspondence between sentence types and utterance types.

b. *Conditions of feasibility*, i.e., conditions regarding the system of aims and expectations within which the action is performed; they deal with the 'how to do,' the procedure. This kind of knowledge concerns the existence and functioning of intersubjectively recognizable strategies by which people match different kinds of action to different actual contexts. The Gricean maxims form an example of proposals made in this area, which can be related to praxeology, inasmuch as they deal with effective acting. However, further research – including cross-cultural work on politeness – has underlined that Grice's maxims are strongly ethnocentric; so, they must be reconsidered, maybe even discarded as possible candidates for the role of pragmatic universals (*see Maxims and Flouting*).

c. *Conditions of recognizability*. These conditions deal with questions such as 'where did you get this from,' 'what made you say this,' and so on, hence with interpretability. This question is related to the study of the different kinds of linguistic and paralinguistic means and markers (lexical, but also morphosyntactic, textual, prosodic, kinesic) available in different languages. Their conventional nature is not given once and for all, but changes over time and space. They narrow down the range of possible reasonable interpretations, on the part of the interpreters, of their partners' communicative behaviors, in abductive processes, by trial and error, through which the assignment of signification is negotiated. Obviously, the more shared knowledge the interactants have, and know they have, the more often they will leave out the intermediate steps in their dialogues, which, as a result, will be mutually understandable by them, but not by an external observer.

From a logical point of view, the three types of conditions are arranged in a hierarchically descending sequence, while from a methodological point of view this sequence is reversed. From a 'practical' point of view, i.e., from the point of view of what is really happening in human interaction, these conditions come together, because the social actors rely and act on the three kinds of conditions simultaneously. The main

problem is that of relating these three types of conditions to the conventional intersubjective practices of everyday interaction where cognitive structures and sociopsychological constraints interact. The difficulties brought about by Searle's constitutive rules, and the rules' inadequacy as micro-models of linguistic action and communicative behavior have been highlighted by Kreckel (1981) (*see Principles and Rules*).

Empirical-Conceptual Approach

The term 'metapragmatics' has been applied in comparative lexical research, particularly as it has centered on verbs defining linguistic actions, i.e., on speech act verbs (*see Speech Acts, Classification and Definition*). Such an approach, defined as 'empirical-conceptual,' starts from the assumption that an investigation of the lexical structure, of the semantics of verbs used to describe speech acts, throws light onto the nature of linguistic action (Verschueren, 1985). Such research has the advantage of bringing the often abstract reflections of classical speech act theory closer to the ways in which linguistic actions are described in individual languages. Now, given that the lexicon forms an interface between pragmatics and grammar, and that the study of the lexicon thus represents an important empirical 'anchorage,' it is still also true that mere lexical research is inherently inadequate for the analysis of interactive dynamics. It is indeed necessary, if actual interaction is not to become irrelevant, to correlate the investigation of the typologies of the verbs that people use to describe linguistic actions with the investigation of what people seem to know 'in real time,' 'live,' about the use of their own language in context. The study of the types of linguistic items (among them lexical items) must be linked to the study of the types of their underlying contextual features and criteria of appropriateness.

It also is important to clarify the level of abstraction at which one is working, so that pragmatic metalanguage is not at the same time both the *definiens* and the *definiendum*: the interiorized conceptualization of the linguist as a native speaker of a particular language should not predetermine his/her selection of the relevant features of a speech act in relation to a (presumably universal) common core.

This type of metapragmatic research has the merit of positing a methodological connection between speech act taxonomy and folk taxonomies. It is well known that languages, those powerful instruments of conceptualization, segment the external world and natural phenomena in different ways, from the color spectrum onward – a much-quoted example both in favor of, and against, the so-called Sapir-Whorf hypothesis. Unlike colors, though, linguistic actions

do not exist *in natura*; they do not come before language use, nor are they separable from it. Regardless of the power of the means we are able to mobilize, a privileged extraterritorial theoretical standpoint from which to look at linguistic actions does not exist.

Metapragmatics 3: The Management of Discourse

Common Knowledge and Reflexivity

The two distinctive features here are the reference to common knowledge – both shared knowledge and folk theories – and reflexivity. Significantly, they coincide with the most resistant barriers that separate artificial intelligence from the human intellect: common sense (a notion which is epistemological, not ideological, as pointed out by Parret, 1983) and reflexivity, i.e., the human intellect's capability and transcendental possibility of thinking (and speaking) about its own thinking (see **Reflexivity**).

Reflexivity is also one of the most distinctive features of natural languages, marking them off from other semiotic systems precisely by this capacity of describing themselves. The complex issue of reflexivity, seen as merging with indexicality and encompassing all metapragmatic activities, has been investigated from an anthropological, cross-cultural viewpoint by Lucy (ed.) (1993). From a more restricted, linguistic viewpoint, an aspect of reflexivity can be found in the possibility that speakers have of communicating on the communication they are engaged in, by defining it and by confirming or modifying the definitions given by themselves and by their partners. Such 'editing,' along with self- or other-initiated repairs, is rooted in metapragmatic reflexivity; so are reformulations, evaluations, metadiscursive comments, and requests for explanations through which mutual understanding is negotiated. In texts and discourse, there are classes of markers – e.g., Gumperz's (1982) 'contextualization cues' – and metacommunicative utterances whose role it is to ensure dialogue management in terms of communicative effectiveness.

When tackling a speech sequence, not only can one describe it, give it a name, but one also can judge whether it is appropriate to the situation. One can understand whether one has chosen – among adequate communicative options – the one that best fits the context; if this is not the case, one can retrace one's steps and correct oneself. One can, in an overall communicative strategy, negotiate the degree of directness, explicitness, or politeness as one goes along. One can decide whether one has said the right thing at the right time in the right way, or whether one has made a tactless remark. If the utterance was

too elliptical or cryptic, ironical, or digressive in relation to a conversational topic (hence requiring adventurous inferential steps), one can ask for explanations and redefine the context and its presuppositions, thereby reshuffling the assignment of rights and duties among the partners.

All such skills are not predicated on clumsy beginners (the 'model readers,' in the sense of Eco (1979), of many textbooks and grammars) but on social actors and 'competent readers' (see Mey, 2000) who use their communicative know-how, not with awe but with pleasure. At the other end of the scale of metapragmatic awareness are gaffes and jokes. This shared metapragmatic awareness is not only linguistic but also semiotic, encyclopedic, and constitutionally intertextual. It refers to a knowledge that concerns not only language as social (culturally and historically determined) behavior but also our 'being in the world.' The problem of metapragmatic appropriateness, being close to the problem of style, lies in that dialectic relationship between expectation and surprise that is peculiar to the communicative exchange. Regarding to a given system of expectations, there will be more or less marked choices. A choice is all the more significant when it is less foreseeable (see Arndt and Janney, 1987): the more it eludes ceremony and routine, the more it communicates. In this sense, the literary text is highly informative in its non-redundancy (see Lotman, 1977). Once one is engaged in a routine, and has chosen a communicative register, the most remarkable and revealing choice will be the unexpected one, the sudden change in the linguistic, intonational, and proxemic register.

Monitoring

A considerable part of metapragmatics as discourse management can be ascribed to monitoring, to definitions of the situation furnished by the interactants as they go along. Ethnomethodologists call these definitions 'glosses,' specifying that these are not an exception but the rule in spontaneous verbal interaction. Interaction management includes a control on discourse which refers to the conditions of feasibility and interpretability mentioned in 'Metapragmatics 2' above. This monitoring can be found at a macro-level, e.g., in the allocation of conversational rights, in the kind of sequence and the thematic development of turns, or at a micro-level, in the explicit focusing of speech on speech and on its micro-organization (e.g., utterances like 'What I mean is . . .,' or, in written texts, the heading of a paragraph). Every utterance that not only performs some kind of action but also describes it, venturing a description of 'what is happening' (which it is up to the hearer to validate), plays

a monitoring role. Pragmatics started as the analysis of ritual performative utterances which do what they say and say what they do. A metapragmatic paradox is that, in everyday speech, if I want to do something, I must not say I am going to do it. In order to 'state,' for instance, I must not say 'I state that.' If I do, it means I am doing something else. In order to perform an action, I must avoid naming it. In discourse, however, there can be a syntactic and temporal displacement between an action and its description. This is what happens in the metacommunicative acts that describe a speech sequence from an illocutionary point of view (e.g., 'This was a promise, an order, a simple statement,' etc.). Because this kind of description is an important means of orienting the interaction processing, the metacommunicative acts can be referred to as 'speech control': they offer a labeling of preceding actions (anaphorically) or subsequent ones (cataphorically), and they focus on the simultaneous presence in discourse of linearity (a preceding sequence X can be classified as Y) and a depth (the speaker is both the involved participant and the observer of him/herself and of the interaction). Discourse has both a sequential and a hierarchical organization **Discourse, Foucauldian Approach**. Finally, it is worth noting that metaillocutionary qualification is often also metatextual and cohesive (e.g., 'That was a question'), but not *vice versa*.

From a (not only) terminological point of view, 'metapragmatic' is a hyperonym in relation both to 'metatextual' (comprising those mechanisms which enable one to signpost one's way through the text, e.g., textual deixis) and to 'metaillocutionary' (comprising those mechanisms that make explicit the kind of illocutionary act, e.g., as metacommunicative acts). Finally, if 'metacommunication' is meant as something more limited and more precise than as defined by Watzlawick *et al.* (1967), for instance, if one takes it as qualifying a global communicative modality (e.g., 'I was only joking'), then it falls within the range of metapragmatics.

Applying Metapragmatics

Conflicts have their origins in different definitions of the same situation. As Watzlawick *et al.* state, "The ability to metacommunicate appropriately is not only the *conditio sine qua non* of successful communication, but is intimately linked with the enormous problem of the awareness of self and others" (1967: 53).

Like philosophy and anthropology, metapragmatics has 'therapeutic' potential. At any level, both theoretical and everyday, whenever a social group or a speaker look critically at themselves, maybe making corrections, adjustments or clarifying comments on

their discourse, the dangerous identification between Self and *the* point of view is broken, and the road opens up to the legitimization of other points of view. The 'meta-' determines that space in which the other's perspective can be accepted. Moreover, metapragmatic awareness enables the speaker not to adhere to the established sociocommunicative roles and routines so closely as to be totally absorbed by them. Metapragmatics specializes in the control of the argumentative conditions and strategies, lending itself easily to becoming a critical instrument of fundamental importance in digging up and highlighting the underlying presuppositions as well as the different kinds of the unsaid. It is clearly helpful in, for example, first language acquisition (see, among others, Gombert, 1993; Bernicot and Laval, 1996) and second language learning, in the cross-cultural comparison of the ways in which a linguistic and social group represents and recognizes itself (see, among others, Blum-Kulka, 1992), in the analysis and discussion of any, more or less openly authoritarian and unidirectional, discourse (see, among others, Jacquemet, 1992). Metapragmatic competence is potentially subversive, such as when it enables the hearer to verify that the preparatory conditions of appropriateness of a speech act are fulfilled (as an example, imagine a patient saying 'Why are you doing this?' to his/her doctor).

Metapragmatic knowledge is a crucial step toward an ecology of communication.

Conclusions

The possible meanings of metapragmatics mentioned at the outset are not mutually exclusive; on the contrary, they can be related to, and even be integrated with, each other. For example, if one chooses to stress metapragmatics in sense 3 (see 'Metapragmatics 3') rather than in senses 1 or 2, this is a theoretical choice (see 'Metapragmatics 1'). One can even claim that the only non-transcendental way of legitimizing metapragmatics (relevant for sense 1) is one that records and analyzes specific communicative practices in socially and historically determined contexts. Its not being indifferent to individual languages is a major requirement for a non-metaphysical metapragmatics. Another requirement is that of not being indifferent to the ways in which people express their knowledge, e.g., by feedback on and adjustments to, what they are doing communicatively, thus building up the interpretation which is the result of the cross-inferential work on the part of all the participants involved. A systematic account of this knowledge is a difficult interdisciplinary enterprise, which cannot be merely introspective. While pragmatics has experienced, there is the risk of replacing a metaphysics of

introspection with a metaphysics of empirical data, in an excessive fragmentation of the research work and its findings that leaves no room for any significant generalization.

One possible theoretical choice and one that in the present, extremely varied and lively state of the debate, can only be a partial choice, consists in denying the existence of any clear-cut division between 'scientific' metapragmatic knowledge and the metapragmatic knowledge of the users of a language, and instead, assuming there exists a *continuum*, at a smaller or greater distance from the object, viz.: the use of the language.

The basic assumption which is relevant to the first sense of metapragmatics as metatheoretical reflection, could then be to hold that in pragmatics, there are different degrees of explicitness in, but no differences in nature between, folk and scientific theories. The metapragmatic paradox is that the traditional metatheoretical top-down control is valid only if it is kept down to earth.

High-sounding transcendencies are replaced by inevitably partial analyses of what is constitutive of the communicative practices in which one is involved, of the ways in which awareness of self and of others comes out, not just in order to speak about the world, but to change it, and oneself, through discourse. The program of metapragmatics (its Manifesto) might be the (meta-)pragmatic sentence that Socrates (had he not been forced by the tyrants to drink the hemlock) would have added to his motto 'I know I don't know': 'I don't know enough that I do know.'

Metonymy

B Nerlich, University of Nottingham, Nottingham, UK

Metonymy: History and Terminology

Metonymy has been studied for at least 2000 years by rhetoricians, for 200 years by historical semanticists, and for about two decades by cognitive linguists. More recently, metonymy has come to be recognized as a fundamental cognitive and linguistic phenomenon alongside metaphor that manifests itself in the lexicon as well as in grammar (Panther and Radden, 1999; Barcelona, 2000; Nerlich and Clarke, 2001; Dirven and Pörings, 2002; Panther and Thornburg, 2003; Steen, 2004).

The earliest definition of metonymy can be found in the *Rhetorica ad Herennium*, written before 82 A.D.:

Denominatio est, quae ab rebus propinquis et finitimis trahit orationem, qua possit intellegi res, quae non suo vocabula sit appellata.

Denominatio [i.e., 'metonymy'] is a trope that takes its expression from *near and close things* and by which we can comprehend a thing that is not denominated by its proper word. (Koch, 1999: 140–141)

A classic example of the rhetorical use of metonymy is 'The pen is mightier than the sword.' In 1980 the cognitive linguists Lakoff and Johnson (1980) introduced the concept of conventional or conceptual metonymy alongside the concept of conceptual metaphor. They argued that metaphor and metonymy are not just rhetorical devices, but pervade our talking, thinking and acting in the world. According to this new view, a conventional metonymy is a metonymy that is commonly used in everyday language in a culture to give structure to some portion of that culture's conceptual system. Metonymies can be based on many cognitive and culturally based conceptual relationships. To give only two examples (there are more later in this article): in 'Napoleon lost at Waterloo,' metonymy is based on the controller-controlled relationship; in 'The kettle is boiling,' metonymy is based on the container-contents relationship. One of the more recent definitions of metonymy, rooted in this new view of metaphor and metonymy, is the following:

Metonymy is a cognitive process in which one conceptual entity, the vehicle, provides mental access to another conceptual entity, the target, within the same idealized cognitive model. (Radden and Kövecses, 1999: 21)

Here the 'near and close things' referred to in the *Rhetorica ad Herennium* have been replaced by Lakoff's 'idealized cognitive models.' Other researchers work with the terminology of domains, schemas, or frames instead.

In between the *Rhetorica ad Herennium* and the more recent publications, research into metonymy picked up ideas from traditional rhetoric (metonymy was part of the tropical triad of metaphor, metonymy, and synecdoche or else of the quadruple of metaphor, metonymy, synecdoche, and irony), from associationist psychology (it inherited the distinction between contiguity and similarity as defining the difference between metonymy and metaphor), from Saussurian linguistics (it inherited the distinction between syntagmatic and paradigmatic relations, which Jakobson (1956) used to distinguish between metaphor and metonymy), from interactionist approaches to metaphor (Black, 1979) (it inherited the distinction between tenor and vehicle), and from Gestalt psychology (it inherited the distinction between figure and ground). This last influence has come to the fore in recent years through Langacker's work and has been successfully integrated into various frame-based analyses of metonymy.

An example of this type of analysis can be found in Panther and Radden (1999). They study the following metonymy:

- (1) The first violin has the flu.

The concept 'the first violin' is part of a knowledge structure that it evokes. As a musical instrument, a violin is immediately associated with the violinist as the player of that instrument. Moreover, the first violinist is defined as a member of a larger group of musicians, the symphony orchestra. Among the musicians of the orchestra, the first violinist is the most outstanding member. Finally, our knowledge of orchestras includes, among other things, the notion of music and its representation in scores. The predication *has the flu* as well as the attribute *first* trigger a non-literal interpretation of the noun phrase *the first violin*. Thus, the metonymic reading in [1] involves a shift from the instrument to the musician as the most readily available element in the frame. Through this metonymic shift, the reference point ('the first violin') is backgrounded and the desired target ('the first violinist') is foregrounded. (Panther and Radden, 1999: 9)

This analysis draws on Langacker's (cognitive) distinction between reference-point and target (1993: 3). For Langacker, metonymy is a reference-point phenomenon in that "the entity that is normally designated by a metonymic expression serves as a reference point affording mental access to the desired target,

i.e. the entity actually being referred to” (Langacker, 1987: 385–386).

The distinction between reference-point and target can be compared to those made in pragmatics between what is said and what is meant, what is said and what is referred to, what is said and what is only implied, and between the conventional meaning/referent and the intended meaning/referent of the words used. This brings us to the question: Is metonymy a conceptual/cognitive or a referential/pragmatic phenomenon? Or both?

Metonymy: From Cognition to Social Interaction

At present, there are two camps in the cognitive linguistic community: those who see metonymy essentially as a referential and/or pragmatic phenomenon and those who see it essentially as a conceptual and cognitive one (Nunberg, 1978; Feyaerts, 1997: 74–76). For Seto, for example, metonymy “is a referential transfer phenomenon based on the spatio-temporal contiguity as conceived by the speaker between an entity and another in the (real) world” (Seto, 1999: 91). At the other end of the spectrum we find Kövesces and Radden’s (1998) work, in which metonymy is radically defined as a conceptual phenomenon. Lakoff and Turner (1989: 103) were rather more cautious when they wrote that metonymy “is used primarily for reference: via metonymy, one can refer to one entity in a schema by referring to another entity in the same schema.”

More recently, Warren has made the distinction between referential metonymy and propositional metonymy, in which the former is based on reference-based relations, such as between cause and effect or container and content, the latter on antecedent-consequent relations (or if-then relations). An example of referential metonymy is: “*The bathtub* is running over. [That which is in the tub, i.e., the *water*]” (Warren, 1999: 127). An example of propositional metonymy is: “It won’t happen while I still *breathe*. [If he breathes, then he lives]” (p. 129). Warren defines referential metonymy in the following way:

For anything to qualify as a referential metonym, the following applies:

- (i) it should have a referent,
- (ii) the intended referent is not explicitly mentioned but its retrieval depends on inference,
- (iii) inference is made possible because there is some connection between the mentioned referent (the trigger) and the implied referent (the target) deemed so well known that in the context in question the former will automatically suggest the latter. (Warren, 1999: 123)

For Warren, “the actual meaning-construction of metonyms depends on successful referent-identification. We cannot be certain that we have worked out the correct metonymic extension, unless we believe we know what the referent is” (Warren, 1992: 68). It seems that our ability to create and understand metonyms is grounded in our ability to infer the referential intentions of others in linguistic interaction (see Burling, 1999).

Metaphor and Metonymy

From this point of view, one can argue that metonymy is a pragmatic strategy used by speakers to convey to hearers something new about something already well known. This distinguishes it from metaphor, which can be regarded as a pragmatic strategy used by speakers to convey to hearers something new that cannot easily be said or understood otherwise or to give an old concept a novel, witty, or amusing package. Using metaphors, speakers tell you more than what they actually say; using metonyms they tell you more while saying less. From the point of view of the hearer, metaphor is a strategy used to extract new information from old words, whereas metonymy is a strategy used to extract more information from fewer words. Metaphor is a conceptual and semantic simulation device, whereas metonymy is a conceptual and syntactic abbreviation device. Both are pragmatically grounded and exploit cognitive mapping processes.

An example of the use of a metaphoric strategy would be the child who points to an oil spill on the road and says:

- (14) “Look: A dead rainbow!” (Todd and Clarke, 1999)

An example of the use of a metonymic strategy would be the German passenger who, in 1997, looked down from a plane approaching Heathrow and said to his wife, when pointing to a cow:

- (15) “Look: BSE!”

In the first case, the mother has to *create* a relation between the oil spill shimmering in many colours and a rainbow, a rainbow that seems to have been reduced to a sad puddle. In the second case the wife can *exploit* a given relation between cows and the potentially deadly disease they might carry (BSE, Bovine Spongiform Encephalopathy, or ‘mad cow disease’). Here the relation is not created but presupposed (Bredin, 1984: 57). In the case of metonymy, the hearer has to find the target item and interpret it by retrieving a relation between it and the trigger. As conceptual metonymic relations (such as cause-effect, part-whole, container-content)

are cognitively well entrenched, the interpretation of metonymy is less demanding than the interpretation of a metaphor, where the possible links between what is said and what is meant are relatively open-ended (Warren, 1992: 99).

Whereas our ability to leap through mental spaces and establish unexpected but enlightening links between features of these spaces underlies metaphor, our ability to access an entire state, situation or object from the mention of some part is the hallmark of metonymic thinking (Warren, 1999: 122).

Both metaphor and metonymy can lead to semantic change and polysemy. In the case of metonymic sense extension, the pathways we use seem to be cognitively entrenched and rooted in patterns of human action and experiences of handling objects. Many linguists have tried to establish typologies of these 'pathways' of metonymic sense extension (Nerlich *et al.*, 1999), but one example will suffice here. In 1981, Norrick distinguished the following types of metonymy and correlated them with 18 metonymic principles. This typology includes the part-whole relationship often called synecdoche (on the metonymy and synecdoche, see Nerlich and Clarke, 1999; Seto, 1999, 2003).

- I. Cause – effect
 1. Cause – effect
 2. Producer – product
 3. Natural source – natural product
 4. Instrument – product
- II. Acts and major participants
 1. Object – act
 2. Instrument – act
 3. Agent – act
 4. Agent – instrument
- III. Part – whole
 1. Part – whole
 2. Act – complex act
 3. Central factor – institution
- IV. Container – content
 1. Container – content
 2. Locality – occupant
 3. Costume – wearer
- V. Experience – convention
 1. Experience – convention
 2. Manifestation – definition
- VI. Possessor – possession
 1. Possessor – possession
 2. Office holder – office

This use of well-established conceptual pathways makes metonymy quite different from metaphor.

As a result of the use of a metaphor, salient features of words and objects are blended across semantic and conceptual space. Metaphor binds distant conceptual domains together and creates conceptual networks. As a result of the use of a metonym, a word absorbs salient features inside a referential or conceptual space or, to put it differently, it spreads out over conceptual space(s). Whereas metaphor creates new meaning and possibly new conceptual structures, metonymy incorporates free-floating meaning, steals meaning from related concepts and conceptual domains, and thereby changes or strengthens given conceptual structures.

Synchronically, metonymies are created by exploiting contiguous relations inside a conceptual/referential domain. This can have a rhetorical effect, as in "Look, BSE!" or else be the result of pragmatic constraints on cost-effective communication (as in 'The appendix has just passed out'). Diachronically, metonymies can spread serially (which can lead to synchronic polysemies, such as *panel* which can mean either 'flat distinct section of a larger surface, such as that in a door' or 'a group of people as a team' or 'list of jurors,' etc., similar to *board*) from, say, *board* to table to food (as in *bed and board*) to the people who sit around the table, etc. This chaining follows 'natural' relations, quite often based on immediate proximity between objects and people in space. As interlocutors do not cross distant conceptual boundaries, they tend not to exploit and create the wide conceptual networks on which metaphorical expressions are based.

Conclusion

The definition of metonymy inside cognitive linguistics is still fluid and this article could only provide a glimpse into some aspects of research. It did not deal with metonymy and salience (Paradis, 2004), metonymy and qualia, the interaction between metaphor and metonymy, and the universality of conceptual metonymies (see Panther and Thornburg, 2003).

Migration and Language

A Deumert, Monash University, Victoria, Australia

© 2006 Elsevier Ltd. All rights reserved.

Introduction: Migration, Language Diversification, and Contact

Migration – that is, the permanent or temporary movement of people from one geographical area to another – has been a constant of human history since earliest times and has shaped the areal distribution of languages and the history of linguistic groups.

Language diversification and spread as a consequence of migration underpins the histories of large language families, such as Indo-European, Sino-Tibetan, Austronesian, and Afro-Asiatic. The geographical dispersion of languages belonging to these families is the result of large-scale prehistoric migrations, reflecting both military invasions and agricultural expansion. Language diversification through people movement and the subsequent communicative isolation of the migrating group is depicted in the classic *Stammbaum* or family tree model of language change: each split in the diagram reflects a situation where people occupying a geographical area divided, and one group settled in a new, nonadjacent territory.

Migration movements not only support language diversification through geographical dispersion, but also create the conditions for inter-group contact and linguistic convergence, that is, structural borrowing and the leveling of marked distinctions between dialects and languages (*Sprachbund* phenomena and koinéization/dialect leveling). Contact between different linguistic groups also leads to the formation of new forms of speech: trade jargons and other contact languages (pidgin/creoles, mixed languages, second language varieties) have emerged as a direct result of human mobility.

Migration movements are particularly prevalent in times of accelerated social, political, and economic change (e.g., demographic growth, technological innovation, political conflict and persecution, economic deprivation and poverty). Wars, industrialization, colonialism, and the subsequent emergence of a global capitalist world market have all led to high rates of national and transnational migration, and have shaped states and societies across the world (Castle and Miller, 1998).

Dialect Leveling and Dialect Formation

Whereas traditional dialectologists often evoked an idealized ‘linguistics of isolation and immobility’ (Chambers, 2002: 117) – epitomized in the construct of the ‘non-mobile, older, rural male’ (NORM; cf. Chambers and Trudgill, 1998) as the ideal informant

– modern dialectologists and sociolinguists have shifted their attention to the systematic study of the linguistic consequences of geographical mobility. High levels of rural-to-urban migration have not only contributed to the gradual decline of traditional rural dialects (dialect loss), but new composite dialects have crystallized rapidly in urban environments. London, for example, has always been characterized by high levels of immigration and linguistic mixing. In the 16th century the emerging London norm was significantly shaped by the influx of large numbers of northerners into the city. Some northern dialect forms, such as, e.g., the northern third person plural marker *-(e)s* (*know(e)s* vs. southern *-th*, *knoweth*), were incorporated into the emerging norm of London English (and subsequently into standard English; Nevalainen, 2000).

The development of planned urban communities in areas targeted for industrial expansion in the 1960s and 1970s, the so-called new towns, offered linguists an opportunity to study processes of dialect mixing and leveling in real time. Kerswill and Williams (1992; also Kerswill, 1996) compared the speech of children in Milton Keynes, a new (1969) urban development near London, with that of their parents who had moved to the town from elsewhere in the south-east, and also northern England and overseas. They found that the children’s dialect lacked regional distinctiveness, and differed both from their parents’ dialects and from the local dialects spoken in the nearby areas. Children used various linguistic strategies in their creation of the new dialect: they avoided strong regional forms used by their parents, developed phonetically intermediate forms, which mediated between the various dialect inputs, and generally preferred forms that were similar to the non-localized, RP-like southeastern norm.

Dialect leveling also played a major role in colonial settlements. In South Africa, Australia, and New Zealand relatively homogenous colonial dialects developed on the basis of the diverse input dialects of the migrating settlers (Trudgill, 1986; Chambers, 2003: 65ff.).

In multilingual countries (e.g., South Africa, Switzerland) urbanization also led to the formation of multilingual cities (in other countries this development is a consequence of transnational migration): Xhosa, the language of many rural-to-urban migrants in South Africa, is now a major language in Cape Town (next to Afrikaans and English), and French and Italian are competing with Swiss-German in Basel, a historically German-speaking town (Lüdi, 1995).

Whereas traditional dialectological and sociolinguistic studies stipulated that their subjects should be locals (or have arrived in the area before the age of

seven, i.e., at an age when they could still master the phonological complexities of the dialect), Chambers (2002) argued for the need to include non-local residents into modern dialect surveys. He introduced migration as an independent variable using the Regionality Index (RI), which identifies the migration history of informants on the basis of the following indicators: place of birth of informant, place of birth of parents, area where respondent grew up, and area of residence. The RI is similar to the 'combined birth-country criterion,' i.e., birth country of person as well as parents, which is used in transnational migration research (cf. Extra and Gorter, 2001).

Bilingualism, Language Shift, and Maintenance

In some cases migrating people have imposed their language(s) on the indigenous population: the southward migration of Bantu-speaking groups (starting around 1000 B.C.) led to the absorption or displacement of indigenous hunter-gatherer communities; the Roman Empire spread its language through warfare and conquest; European colonial settlements transformed the political and linguistic landscapes in Africa, the Americas, and Asia. In-migration of powerful groups can thus contribute to the creation of indigenous minority groups and/or language shift. Less powerful migrant groups usually assimilate to the dominant language of the new society: the French Huguenots who arrived in South Africa in the 1680s adopted Dutch, the dominant language of the colony; in the 20th century Jewish migrants to the United States adopted English, in earlier migrations their ancestors had adopted Lithuanian and Polish (which they used alongside their ethnic language, Yiddish). Bilingualism and code-switching are frequently observed among second and third generation migrants, where they become markers of the migrants' hybrid, bi-cultural identities (cf., for example, Zentella's 1997 study of Spanish-English code-switching in El Barrio, a Puerto Rican neighborhood in NYC; cf. also Dabène and Moore, 1995; a classic article on migration and hybridity is Park, 1928).

Long-term language maintenance is rare among migrants who move as individuals or in small family groups, and intergenerational language shift – which is indicated by the co-existence of different mother tongues within a household – is usually completed within three generations (Nahirny and Fishman, 1965). Clyne (1991) has shown on the basis of his analysis of the Australian census information that the rate of shift differs across migrant language groups. Important variables, which support or delay language shift, are: settlement patterns (presence or

absence of cohesive ethnic suburbs), endogamy, cultural distance from the host society, contact with the home country, and cultural values attached to language. Horvath (1985), in her study of vowel variation in Australian English, has illustrated how Italian and Greek migrants are gradually incorporated into the Australian English speech community: first-generation migrants form a peripheral group (she describes their English as 'accented' and 'ethnic broad'; basically, they use second-language varieties), second-generation migrants were full (usually bilingual) members of the host speech community.

Group migration tends to delay language shift. Long-term intergenerational language maintenance has been documented for the so-called *Sprachinseln* ('language islands' or language enclaves). These geographically-bound territories are typically located in rural areas and reflect the cohesive settlement patterns of the original migrants. Subsequent generations maintain their linguistic and cultural/religious distinctiveness from the surrounding host society. Well-known examples of linguistic enclaves are the German-speaking settlements in eastern and southeastern Europe that were formed as a consequence of migrations since the Middle Ages, and also the 18th century Amish settlements in North America. Language maintenance in these areas occurs in functional complementarity with the language(s) of the host society (cf. the papers in Berend and Mattheier, 1994). Community bilingualism, however, affects the structures of the heritage language, and heavy lexical and structural borrowing are commonly observed (cf. Loudon on Pennsylvania Dutch in Berend and Mattheier, 1994).

Mass Migration and Language Formation

The forced mass migrations associated with slavery have led to the formation of stable contact languages in Africa, the Caribbean, and Asia. The plantation system created a catastrophic break in linguistic tradition: captured slaves not only spoke a variety of diverse native languages, but they also dramatically lost all contact with their homeland, did not share a lingua franca with the other slaves, and had only minimal access to the dominant colonial language of their masters (Sankoff, 1979). The pidgin/creole languages that emerged in these contexts supplanted the original languages of the slaves, and became the basis for the formation of new cultural and linguistic communities in the diaspora.

The situation was different in the case of indentured labor migrations that took place in the mid- to late 19th and early 20th centuries. Although work conditions were generally poor and laborers were often coerced into employment, it was, at least in principle, possible to

return home upon completion of the contract. Moreover, unlike slaves, indentured workers did not form “a pulverized mass of individuals from several tribes, but instead they were limited to men of a few nationalities, who found themselves together in a situation in which community life of a sort was possible” (Reinecke, 1969: 114). Conditions were thus generally favorable for language retention, and inter-dialect leveling has been described for the transplanted languages of indentured workers (Mesthrie, 1991 with regard to Bhojpuri in South Africa). At the same time workers acquired a knowledge of the language(s) of the host society. These second language acquisition processes contributed to the creation of new varieties of the dominant language, which replaced the workers’ original mother tongues after several generations in the diaspora (cf. Mesthrie, 1992).

Structural similarities between pidgin/creole languages and the outcomes of second language acquisition in the context of mass labor migration have been explored systematically with regard to fossilized interlanguages such as, e.g., *Gastarbeiterdeutsch* (‘guest workers’ German; cf. Clyne, 1968 for an early discussion), and also ‘immigrant Swedish’ (e.g., *Rinkeby* Swedish, as described by Kotsinas, 2001). Both varieties show grammatical reduction and phonological simplification akin to pidgin languages (cf. also Smart, 1990 for a description of pidgin Arabic used by Asian labor migrants in the Gulf states). However, a stable contact language did not emerge among second generation migrants in either Germany or Sweden. Instead, teenagers with a migrant background have been found to use a stylized pan-ethnic form of the local language that incorporates certain features (e.g., phonology, intonation) of their parents’ second language. This pan-ethnic variety of the target language is seen as ‘deficient’ by native speakers, but serves as a symbolic badge of membership in the larger migrant community (on the ideological implications of popular debates about *Rinkeby* Swedish, see Stroud, 2004). A similar phenomenon has been described for Australia where such speech forms are colloquially referred to as *wog-speak* (‘wog’ can be used in a self-mocking sense by migrants to designate their bicultural identity; Warren, 1999; Clyne *et al.*, 2001). Under conditions of social segregation and intergroup conflict, such ethnolectal developments can lead to long-term processes of linguistic divergence and the development of oppositional linguistic (sub-)cultures.

Transnational Migration, Language, and Citizenship

Transnational migration has grown in volume and significance since 1945. High levels of in-migration

have changed the demographic, economic, and social structures in many countries and have led to the formation of new ethno-linguistic minorities (cf. the papers in Extra and Gorter, 2001 and Extra and Verhoeven, 1998). Transnational migration is largely an urban phenomenon. Fraser Gupta (2000) uses the term ‘cosmopolis’ to describe multilingual urban settings that have been created by waves of migration, and where the individual’s linguistic and cultural repertoires are characterized by a multiplicity of registers, languages, and cultural traditions (cf. also Castle and Miller, 1998 on the rise of ‘global cities’).

Many countries have recognized the necessity of introducing special language services for new arrivals, and education has been a key site for the implementation of migrants’ linguistic rights. Policies that accept the cultural differences created by migration and grant minority linguistic and cultural rights to migrants have since the late 1970s been instituted in countries such as Australia, Canada, and Sweden. In Australia the Adult Migrant English Program (AMEP) offers up to 510 hours of ESL lessons to adult migrants, and special school-based programs exist for children. At the same time Australia’s language policy aims to develop and maintain languages other than English within the school curriculum and also radio, TV, and print media. In Australia (also Canada and the United States) heritage language education, which focuses on developing appropriate teaching methods for second and third generation migrants, has developed into an important branch of second language pedagogy.

However, multilingual programs have come under attack in Australia (and elsewhere) since the mid-1990s: linguistic and cultural diversity are increasingly viewed as a threat to national homogeneity, and there has been a marked policy shift in favor of emphasizing the teaching of English. As a result bilingual programs and services have been reduced (a similar development has been observed in Sweden: see the articles by Boyd, Ozolins, and Clyne in Extra and Gorter, 2001; for the United States cf. Crawford, 2000). Assimilatory language policies see linguistic and cultural integration as a prerequisite for citizenship, and exclude the migrants’ bicultural and bilingual identities from the public sphere.

Conclusion: Migrants as ‘New’ Ethnic Minorities

Today, migration is a central force in social transformation, international relations, and domestic policy in countries as diverse as Germany, Malawi, and Singapore. Chain migration (secondary migration of family members) and migrant’s social networks,

which encourage and facilitate settlement in a new country, can lead to the formation of ethnic enclaves in societies with large migrant populations. The subsequent development of community networks and institutions (social clubs, churches, etc.) in the host society gradually transforms transitory migrant groups into permanent and relatively cohesive 'new' ethnic communities. Like 'historic' indigenous minorities, migrant minorities are usually vulnerable populations whose linguistic and cultural rights need to be addressed and protected by national language policies and planning.

Minorities and Language

D Gorter, University of the Basque Country, San Sebastian/Donostia, Spain

Introduction

The relationship between minorities and language is complicated. Historically, the problem of minorities is closely related to the development since the 16th century of the modern system of 'nation-states.' The process of state formation, still relevant today, leads to a differentiation between majorities and minorities. It is an inevitable consequence of policies aimed at national homogeneity and cohesion. A distinction has to be made between 'language minorities' and 'minority languages.' The former refers to the social group or community, and the latter to a specific category of languages. Sometimes terms such as 'lesser used,' 'heritage,' 'stateless,' and 'ethnic' language are used in place of 'minority language.' Minority languages are different from majority languages, which are also referred to as 'dominant,' 'national,' or 'state' languages.

There are between 6000 and 7000 different languages in a world of over six billion people. Of all those languages, just a few, such as English or Chinese, are spoken by hundreds of millions of speakers. Most languages are spoken by only a few thousand speakers, or sometimes just a handful of speakers. In fact, 96% of the world's languages are spoken by just 4% of the people. Most of the world's languages are spoken in a broad area on either side of the Equator, in Southeast Asia, India, Africa, and South America. Not all of the 'smaller' languages are minority languages, but most of them are. The theme of minority languages is closely related to 'endangered' or 'threatened' languages, an issue that received increasing attention after Krauss (1992) rang the alarm bell over the future of 90 percent of the world's languages.

Definitions

The concept of 'minority' is problematic from the point of view of several disciplines. What constitutes a minority depends on who defines a minority, and who the beneficiaries are of minority rights. Much work has been done in international law – in lengthy debates and in many forums – concerning minority protection. After World War II, the United Nations expressed a felt need for a clear definition of the concept 'minority.' In particular, the Sub-Commission on the Prevention of Discrimination and the Protection of Minorities became an important agency.

Arriving at such a definition took many years, and proved to be a difficult task. Finally, UN Special Rapporteur Capotorti (1979: 7) defined a minority as "a group numerically smaller than the rest of the population of the State to which it belongs and possessing cultural, physical or historical characteristics, a religion or a language different from those of the rest of the population and show, if only implicitly, a sense of solidarity, directed toward preserving their culture, traditions, religion or language."

Although later studies tried to improve on this definition, it still reflects the general understanding of 'minority' in international law (Pentassuglia, 2002: 72), and covers most minority situations (Thompson, 2001: 130). This definition combines 'objective' and 'subjective' approaches which are sometimes seen as contrasting. 'Objective' means that minorities are seen as given historical facts, in which group membership is given or involuntary. In a subjective approach, the free choice and will of the group members are decisive. However, up to the present day, the term 'minority' is not defined in the most important instruments of international law. The reason is that a definition has to serve certain ideological or political goals. Thus it can exclude certain minorities, and as a consequence some can profit from protective measures, where others cannot. In a more sociological sense, the term 'minority' may also be used to refer to less status and less power. In many studies, this usage is given preference over the commonsense understanding wherein 'minority' only refers to sheer numbers ('less than half' or 'a smaller number').

A basic distinction can be made between 'regional minority languages' and 'immigrant minority languages.' The first type are languages that are indigenous and territorial, minorities created during state formation or because of migration of population groups many centuries ago. The second type is the outcome of more recent international migration processes. Still, many examples can be given of how difficult it is to decide whether a language is a minority language or not (Hoffmann, 1991: 219–247). The difficulty in arriving at an acceptable definition lies in the diversity of situations in which minority languages exist.

In recent years, the definition in the European Charter for Regional or Minority Languages (1998) has gained wide acceptance. 'Regional or minority languages' means:

Languages that are traditionally used within a given territory of a State by nationals of that State who form a group numerically smaller than the rest of the State's population; and different from the official language(s) of that State.

This definition shows the decisive role the nation-state plays in the determination of which language varieties obtain minority rights (and protection), and which do not. The status of a variety as either language or dialect depends primarily on political recognition by a state.

Membership and Numbers

Who belongs to a language minority, and who does not, is not always easy to establish. It does not seem to be possible to give criteria that are valid for all members of a particular group. It is clear that most members of a language minority have certain characteristics in common, but that does not have to be the case for all members. Fundamental criteria for belonging to a language minority are (1) self-categorization, (2) common ancestry, (3) distinctive linguistic, cultural, or historical traits, and (4) a form of social organization that places the language group in a minority position.

These four criteria do not have to be valid for all members of a group, but they do for a large part of them. Self-assignment is a fundamental criterion; categorization by others can also be important, but it is not decisive. Ancestry is usually mixed, and a criterion such as 'linguistic distance' can be extremely complex. A minority can be recognized by the government and obtain provisions or not. Moreover, it is possible to choose to become a member of a minority (by learning the language), or to leave the group (by no longer speaking the language).

Language minorities differ very much in size; there may be only a handful of speakers, or there may be millions. The number of individuals who speak a language seems a simple given, but it does not have to be (Fishman, 1991: 45–46). When drafting a list of minority languages, and the numbers of speakers, one runs inevitably into a lack of consensus on which varieties belong on the list as separate languages, and which may be sub-varieties (Ethnologue, 2004). Counting individuals as speakers is not a straightforward task because there are many different criteria. The most common is mother tongue (i.e., language acquired as a child), but also language competence (the language that someone is able to speak) and main language used (the most important daily means of communication) are considered as criteria. The size of a language minority can therefore differ, depending on whether the mother tongue speakers are counted, or the persons being able to speak a language are included. The speakers of language minorities are counted in different ways; one has to be careful when comparing the sizes of different minorities. All figures are usually estimates.

Analytic Frameworks

Many scholars have presented ideas, models, and theories designed to answer questions related to the conditions under which a shift from minority to majority language takes place, or when a minority language is maintained or revived. Here we can point briefly to a few models, but it is important to mention that a general theory of minority language development is still lacking. These frameworks analyze the relative strength of minorities and the measures necessary for their survival. Often in the past analysts failed to place sufficient emphasis on the social context. The central issue is people, not numbers.

A framework that has gained wide currency in the literature is the ethnolinguistic vitality model (Giles *et al.*, 1977). It is designed as an analytic tool to better assess the position of languages against each other, originally the position of French in Quebec relative to English. The key notion is 'vitality,' which is defined as, "that which makes a group likely to behave as a distinctive and active collective unity in intergroup situations" (Giles *et al.*, 1977: 308). The more vitality a group has, the greater its chances for survival as a distinctive linguistic community. There are three main sets of structural factors that influence the vitality of an ethnolinguistic group: status, demographic, and institutional. The status of a language is dependent upon historical, economic, social, and linguistic factors. Demographic factors have to do with the numbers and distribution of the speakers. Institutional factors concern the position of the language in various sectors of society, such as government, education, mass media, and religion. The stronger the language is on these structural factors, the higher is the ethnolinguistic vitality of the group speaking the language, and the greater are its chances for survival as a linguistic community.

The question can be raised whether an 'objective' account of the position of a (minority) language provided by an expert researcher or a language planner is perceived in the same way by the speakers of the language themselves. For that reason, a 'subjective vitality questionnaire' has been developed to measure the way speakers perceive the vitality of their own and other language groups (Bourhis *et al.*, 1981; Giles and Johnson, 1987).

In 1991, Fishman published his book *Reversing language shift* (RLS) in which he presents a set of ideas for analyzing the situation of (minority) languages around the world. The core of his ideas is formed by the GIDS (Graded Intergenerational Disruption Scale), a kind of scale similar to the one used to measure earthquakes. It establishes the extent

to which a language community has been disrupted in the modern world. It is a functional approach where the language is seen to be used for certain functions in society, and not for others. Many threats face minority language communities, and Fishman wants to offer a diagnostic framework in which language planners and language activists can base their strategies to repair the situation, and to prevent further harm from occurring. The GIDS consists of eight stages, from the first and lowest stage where the language community has been broken up and few speakers remain, to the last stage where the language has the highest functions in national media and government. The crucial point is that the family-neighborhood-community nexus has to be secured in order to make certain that a language is transmitted from one generation to the next. Only when that process of intergenerational language transmission is assured, will a language survive.

An innovative combination of the vitality and RLS perspectives is given by Grin (2003; Grin and Moring, 2002) who has constructed a model of language policy for minority languages. Central is a 'policy-to-outcome' path, and the end result is that the minority language is being used to enhance the vitality of the language. In this model three conditions are necessary to reach the goal of minority language use. The first is the *capacity* to use the minority language, in the sense of an adequate degree of linguistic competence, and education is essential for the capacity development of speakers. Second are *opportunities* to use the language, not only in private but also in public. The language policy of the state can play a crucial role in creating opportunities for public language use. Finally, there must be a *desire* to use the language; usually speakers are bilingual, and have a choice to use either the majority language or the minority language. Policy has to improve language attitudes. Together, these three conditions constitute a set of necessary and sufficient conditions for the outcome of language use to appear. This model of capacity, opportunity, and desire must be seen in a 'language ecology' paradigm that stresses the interrelationship between a language and its broader social context (Grin, 2003: 43–48).

Minority Languages: Oppression

S Baines, Universidade de Brasília, Brasília, Brazil

© 2006 Elsevier Ltd. All rights reserved.

Throughout history, minority languages have been very frequently subjected to oppression and often extinction by state policies rooted in colonial and neocolonial traditions, which aim at linguistic and cultural homogeneity, and also by majority ethnic groups within national states in their efforts to culturally and linguistically dominate and oppress minority groups. In addition, many minority indigenous groups, together with their cultures and languages, have been completely wiped out by introduced epidemics. As part of ethnocentric 'civilizing' projects, which see indigenous languages and cultures as inferior and discriminate against native speakers for using their own languages, the work of traditional missionaries, until recent decades, has also frequently prohibited the use of indigenous languages. In 1981, the Tukano leader Álvaro Sampaio denounced at the Russell Tribunal in Holland that, in the Upper Rio Negro region of Amazonas, Brazil, many indigenous languages disappeared as a result of (mission) boarding schools, where the use of Portuguese was enforced and the use of indigenous languages was prohibited (Sampaio, 1981: 13). Some indigenous peoples, especially in urban settings, facing violent discrimination and, having become ashamed to speak their own languages, avoid teaching their children their language out of fear that they too will be discriminated and, thereby, have fewer chances of a better life.

Historical evidence shows that, when prestige has been conferred on a minority language, it has more chances of survival. The valuing of the Navajo language as a code language by the U.S. government in World War II led to an increase in its use at the time. James Crawford (1998), referring to endangered native languages in North America, outlined the acute

loss of these languages; even in the case of languages which have large populations of speakers such as Navajo (148 530 in 1990, which accounts for 45% of all native American language speakers in the U.S.), the percentage of Navajo who speak only English is increasing. Crawford presented Census Bureau data to show that between 1980 and 1990, among school-age Navajo children living on the reservation, the number of monolingual English speakers more than doubled. Crawford stressed the need to examine the social and historical causes of 'language loss' and the failure on the part of many linguists, in an attempt to separate external and internal factors, to take proper account of the question. This author further demonstrated how the coercive assimilation policy, as practiced by the Bureau of Indian Affairs from the late 1880s until recent decades, has alienated many native people from their cultural roots. In contrast, from the 1980s several indigenous peoples have adopted policies which aim at promoting the use of their languages. Citing Krauss (1992), Crawford emphasized that the will to revive or maintain native languages must come from the speakers, who must feel a need to value their languages (*see Pragmatics: Linguistic Imperialism; Linguistic Decolonialization*).

After a long history of oppression, there have been some recent governmental initiatives such as the Native American Language Acts of 1990 and 1992 in the United States, aiming to promote the protection of indigenous languages with a grant program. A Universal Declaration of Linguistic Rights was drawn up at a meeting of institutions and nongovernment organizations that took place in Barcelona, Spain, in June 1996. It was asserted that invasion, colonization, occupation, and other instances of political, economic, or social subordination often involve the direct imposition of a foreign language, distorting the perception of the value of 'native' languages. This was the first time that the claim to be able to exercise freedom

of speech in the language of one's choosing was clearly stated. Some years later, at the 31st session of the UNESCO General Conference in Paris (November 2, 2001), the UNESCO Universal Declaration on Cultural Diversity was adopted as a legal statement that recognizes, for the first time, cultural diversity as a 'common heritage of humanity' and considers its safeguarding to be a concrete and ethical imperative, inseparable from the respect for human dignity. In 2001, the UNESCO published an atlas of endangered languages (Wurm, 2001) (*see Linguistic Rights*).

Crawford (1998) argued that, in defending the protection of minority languages, the most effective line of argument is an appeal to social justice. The loss of culture and language can, he stressed, destroy a sense of self-worth. Language death occurs to the dispossessed and the disempowered peoples who most need their cultural resources to survive under hegemonic pressures. The oppression of minority languages must be seen as part of a much more encompassing cultural and political oppression, in which any divergent political discourse is oppressed. Jacob Mey argued that an alternative strategy to brutal political repression by hegemonic powers is that "the hegemonic forces of the political majority may take their aim at disrupting the minority's possibilities of participating in the ongoing political discourse by eliminating the access for minority cultures to the exercise of their free speech rights in their own tongues" (1994: 154). The developing field of pragmatics (Mey, 2001) – the study of language from the perspective of its users, of the choices they make, the constraints they encounter in the use of language in social interaction, and the effects their use of language has on other participants in communication – provides an important tool for studying the oppression of minority languages. This and similar approaches stress the socially oriented thinking that sees language primarily as a means of communication between human users (*see Pragmatics: Overview; Social Aspects of Pragmatics*).

One of the pioneers in showing a concern about the oppression of minority languages is the anthropologist-linguist Edward Sapir (1884–1939) (*see Sapir, Edward*), trained by Franz Boas in the early 20th century. Being the only professionally trained linguist among Boas's students, Sapir showed a concern for the need to record endangered Amerindian languages before they were lost to humanity. In 1915, on the Berkeley anthropologist Alfred L. Kroeber's invitation, Sapir went to work in California with Ishi, the last speaker of Yahi, a Yana language, recording the language and culture (1917) (*see Anthropology and Pragmatics*).

Jay Powell of the University of British Columbia and Michael Krauss of the Alaska Native Language

Center of the University of Alaska have carried out important research on language loss and participated in attempts to revitalize languages which have been oppressed, with varying degrees of success. Powell defended the symbolic significance of revitalizing indigenous languages; even when the language does not become fluently spoken again, the use of indigenous words or phrases can help give value and meaning to indigenous cultures and strengthen a sense of indigenous cultural identity. The philosopher Marcelo Dascal (2004) drew attention to the cognitive, emotive, cultural, social, and political functions of languages that, in addition to being tools of communication, carry traditions and cultures.

Among recent works, David Crystal (2000) examined the threat to minority languages and revealed a concern to retain the linguistic and cultural diversity in the world, estimated to comprise 6000 languages in the year 2000. Crystal defined language death, presenting reasons for his concern for the alarming rate of loss of languages (one language dying every two weeks) (2000: 19). He calculated that 4% of the world's 6 billion inhabitants speak 96% of the languages (2000: 14); for 51 languages a lone speaker survived, while 25% of languages had less than 1000 speakers. Crystal explored contributing factors, a major one being negative attitudes to a language, in government policy and local communities. He presented considerations as to how to redress the situation. From his argument of the value of languages, Crystal showed that the attribution of prestige to a threatened language and policies to promote the empowerment of its speakers, given better economic conditions, are favorable factors for its survival.

R. M. W. Dixon (1980) estimated in 1980 that in Australia around 25% of the original languages were extinct and 50% threatened with extinction. Anette Schmidt (1990), ten years later, estimated that 64% are extinct or have only a few elderly speakers, and that 28% are severely threatened. Of the 90 languages this author described as 'surviving,' 70 are classified as being threatened or severely endangered.

Andrew Dalby (2003) focused especially on the linguistic history of Europe and the processes by which minority languages are lost. Lenore Grenoble and Lindsay Whaley (1998) offered an overview of the issues involved in language loss, combining articles of authors of different backgrounds to provide sociological and economic as well as linguistic perspectives on language loss. After an overview of language endangerment, their book presents the situation confronting threatened languages, the issue of what can be lost as a language ceases to be spoken, and the linguistic processes involved.

Daniel Nettle and Suzanne Romaine (2000) related ecological and linguistic vitality, and examined

assumptions about why languages die and how some languages have become dominant; however, their approach has a predominantly ecological bias. Tove Skutnabb-Kangas (2000) examined how most indigenous and minority education contributes to linguistic genocide from a multidisciplinary perspective. This author combined different theoretical concerns such as linguistic human rights, minority and multilingual education, language ecology and threatened languages, the impact of linguistic imperialism and unequal power relations on ethnicity, linguistic and cultural competence, and identities. The book presents many empirical examples from around the globe.

Darcy Ribeiro estimated that between 1900 and 1957, 87 indigenous peoples with their languages and cultures had become extinct in Brazil (1979: 239). Aryon Rodrigues (1993) affirmed that there were about 1273 indigenous languages spoken in Brazil in 1500; here, the loss is of the order of 85% (1993). Bruna Franchetto estimated that, of the 180 languages spoken today in Brazil, the average number of speakers per language is less than 200 (2000: 84–88).

After centuries of oppression, with the rise of indigenous political movements, especially since the 1970s, there have been attempts to demand respect for cultural and linguistic plurality. Efforts have been made to revitalize languages seen as being on the way to extinction, and to revive languages that have become extinct. In the past two decades, constitutional amendments have been introduced in many national states that aim to recognize cultural and linguistic plurality parallel to movements of ethnic and linguistic resurgence. However, despite the very rapid growth of indigenous and minority ethnic group cultural and political movements, the revitalization of oppressed languages occurs in radically different ways across the globe. Rita Segato (1999: 162) observed that some voices, which celebrate the process of ‘globalization’ and do not interpret it as an exacerbation of imperialism, subscribe to the idea that only as a consequence of the internationalization of modern ideas about citizenship and human rights has it become possible for previously invisible peoples to emerge and today claim rights in the name of their identity. Segato proposed that this is only partly true, and pointed to the fact that we are dealing with an ambiguous and unstable process, capable on the one hand of affirming minorities’ rights, but, on the other hand, homogenizing cultures, flattening their lexicons and values, so that they can enter the generalized dispute for resources (1999: 162–163).

In examining the oppression of minority languages and cultures, a dynamic concept of culture is necessary. Language and culture are dynamic and in

constant change, embodying a set of meanings – beliefs, values, knowledge – in an ongoing process of construction, reconstruction, and transformation. Traditions are revitalized, reinvented, and lived through languages. However, many minority languages and cultures suffer violent oppression not only from strictly language-oriented policies (such as practiced in education), but also by the encroachment of national societies on the lands of indigenous peoples and as part of cultural and political domination.

Mitigation

C Caffi, Genoa University, Genoa, Italy & University of Lugano, Switzerland

© 2006 Elsevier Ltd. All rights reserved.

In everyday language, 'mitigation' as an action noun can refer both to the action of mitigating, and to the fact of being mitigated. The former sense foregrounds the process, the latter the result. In the technical use of the term, mitigation is an all-embracing category employed in pragmatics (see **Pragmatics: Overview**) to label the wide set of strategies by which speakers attenuate one or more aspects of their speech.

Many rhetorical figures, such as periphrasis, euphemism, litotes, understatement, meiosis, or reticence, can be subsumed under the label 'mitigation,' as they can all be viewed as saying less, while not necessarily meaning more. In mitigation, something which is somehow expected, is substituted, side-stepped, disguised, or simply deleted and left unsaid by the speaker, out of manners, cautiousness, or modesty: it is up to the hearer to reconstruct it inferentially.

The notion and the term were introduced in pragmatics by Fraser (1980) to refer to the linguistic devices by which speakers try to protect themselves against various kind of interactional risks. Fraser (1980) listed the following as typical mitigating devices in English: indirect acts and justification moves (especially for directives), passive and impersonal constructions where references to speaker and hearer are deleted, epistemic disclaimers (e.g., *If I'm not wrong*) and non-epistemic disclaimers (e.g., *I hate to do this, but...*, *If you wouldn't mind...*), parenthetical forms and modal adverbs reducing commitment to the proposition (e.g., *probably*, *possibly*, etc.), tag questions, hedges (e.g., *technically*) in

Lakoff's (1973) sense of the term. According to Fraser (1980), mitigation can be 'self-serving,' in which case it aims at avoiding possible unwelcome outcomes for the speaker, or 'altruistic,' in which case it aims at reducing negative effects for the hearer.

Historical Background

Both the term (*mitigatio*) and the notion itself are found in the *Rhetorica ad Herennium*, a treatise from the second decade of the 1st century B.C., of uncertain authorship, usually attributed to Cicero. This manual transposes the Greek art of rhetoric into the practical Roman spirit; the author describes the effect of *deminutio* ('belittlement') and explains that it should be used, out of prudence, to avoid antagonism and antipathy in speaking (*Rhet. Her.*, IV, XXXVII, 50).

Mitigation has been used as a technical notion in linguistic pragmatics since the late 1970s, when a main concern in pragmatic research was to make the concept of illocutionary act (Austin, 1962) operational in the analysis of discourse.

From this period on, in the vast research field on politeness (a vastness that is well documented, among others, by Kasper, 1990; Watts *et al.*, 1992; DuFon *et al.*, 1994), some mitigation-related notions, if not the term, are overtly or covertly at work. Among these, the most influential model of politeness (see **Politeness**), that of Brown and Levinson (1987 [1978]), treats mitigation as a synonym of politeness (1987: 42). The 'face-saving view' of interaction (Fraser, 1990), based on Goffman's notion of 'face' (Goffman, 1967; for a reexamination, see the Focus on Issue on 'Face' of the *Journal of Pragmatics*, 2003) (see **Goffman, Erving; Face**), has the idea of mitigation at its core: the strategies of both positive

politeness (related to social approval) and of negative politeness (related to privacy and autonomy) can be read as mitigating strategies. Subsequent research into politeness, which is more directly linked to mitigation, has focused on the devices that minimize the impact of a face-threatening act (FTA), especially requests. The ‘maxims of politeness’ put forward by Leech (1983: 132ff) in his model of discourse, in particular the ‘Tact Maxim,’ all have a bearing on mitigation as they are based on a general ‘interpersonal rhetoric,’ which mainly aims at avoiding disagreement and at fostering agreement between interlocutors (*see Maxims and Flouting*).

Significantly, the notion of mitigation becomes a widely recognized analytical tool when the epistemological orientation in pragmatics shifts from an introspective, philosophically oriented paradigm to an empirical one that is increasingly addressing real, non-constructed data, in *situated* contexts (in the sense assigned to the term by Mey, 2001: 219ff).

These two requirements (non-constructed data that are taken from, or are characteristic of, specific interactional contexts) are distinctive features of studies in which mitigation is used. In particular, Labov and Fanshel (1977), in their thorough analysis of a therapy session involving Rhoda, a girl suffering from anorexia, and her psychotherapist, introduce the concept of mitigation as opposed to that of ‘aggravation’ to designate two “basic interactive dimensions” (p. 84). Mitigation is rooted in “the subject’s desire to mitigate or modify his [*sic*] expression to avoid creating offense” (1977: 84). In a pedagogical framework, Edmondson and House (1989), applying Edmondson’s (1981) theoretical model, propose many moves that are conceptually related to mitigation inasmuch as they can be described as ‘hearer-supportive.’ Specifically, Edmondson (1981: 115ff) proposes three types of supportive moves, viz. grounders, expanders, and disarmers, which play mitigating functions. In a similar vein, Meyer-Hermann and Weingarten (1982) focus on psychotherapeutic conversation, whereas Langner (1994) takes his data from college classroom interaction. Both these works use an interesting notion of mitigation (German: *Abschwächung*) which is defined as a reduction of obligations for the interlocutors. Prince *et al.* (1982), based on a corpus of physician-physician dialogues, is a study of the linguistic means doctors use in order to be cautious and to weigh the degree of certainty of their utterances. Two main types of modifications are distinguished: ‘approximators’ (roughly corresponding to Lakoff’s [1973] ‘hedges’) and ‘shields,’ i.e., expressions “conveying some markedness with respect to speaker’s commitment” (Prince *et al.*, 1982: 86).

Among the works that do not only apply the concept but propose insights on its grounding and

functioning, Holmes (1984) concentrates on strategies that attenuate or reinforce (‘boost’) illocutionary force. Moving on from Fraser (1980), Holmes (1984) treats mitigation as a particular case of attenuation, occurring when the predictable effects of a speech act (*see Speech Acts*) are negative. According to Holmes, attenuation devices affecting illocutionary force can be grouped into the following four categories: (1) prosodic devices (e.g., a falling-rising intonational contour, realizing the epistemic mode in English, decreased emphasis, lower voice, etc.); (2) syntactic devices (e.g., tag questions, impersonal constructions, double negatives in formal discourse, etc.); (3) lexical devices; and (4) discourse devices (e.g., digression indicators like *by the way*, which, as already observed by Brown and Levinson [1978: 174], reduce the relevance of the utterance they introduce). Lexical devices are further divided into: attenuating devices focusing on the speaker (for instance, parenthetical expressions such as *I gather, I guess, I suppose*); attenuating devices focusing on the hearer (e.g., *you know, if you don’t mind, if you are sure that’s OK*); and attenuating devices focusing on content or ‘other.’ This latter category includes attenuating mechanisms realized by epistemic adverbials such as *possibly* and *probably*, and adverbials displacing the responsibility for what is being said to other sources (e.g., *allegedly, reportedly, presumably*).

Blum-Kulka *et al.*’s (1989) study in the framework of a research project on cross-cultural speech act realization (CCSARP) is centered on the linguistic realizations of requests and apologies in various languages, with different degrees of conventionalization. As to requests, these lend themselves to mitigation more easily than do other speech acts because they are inherently invasive of the other’s territory, being face-threatening acts (FTA) in Brown and Levinson’s (1987 [1978]) terms (*see Face*). Conversely, apologies tend to be reinforced in order to be more effective. The authors draw a distinction between internal and external mitigation: the former occurs within the speech act, while the latter occurs outside it and corresponds to what in other frameworks (*see Conversation Analysis*) are called ‘pre-sequences’ or ‘grounders.’ As documented by Blum-Kulka *et al.*’s important collection of data, the category ‘mitigation’ proves to be useful for the interethnic comparison of different strategies of performance of speech acts in cross-cultural research (*see Intercultural Pragmatics and Communication*).

Theoretical Questions

Even from the brief overview above, it appears that diverse notions of mitigation, in different approaches and in varying terminology (from

'cajolers' to 'sweeteners,' from 'softeners' to 'disarmers,' from 'rounders' to 'shields,' etc.), all rely on some assumptions that can be summarized in the following points:

1. the notion of mitigation presupposes that an illocutionary act can be modified; in other words, illocutionary force can be seen as having degrees of strength (among others, Holmes, 1984; Sbisà, 2001);
2. such a modification calls into play an intensity factor that in many cases can be thought of as scalar;
3. the intensity factor itself can be modified in the direction of a weakening (resulting in what is called 'mitigation,' 'attenuation,' 'downgrading,' etc.) or in the direction of a strengthening (resulting in what is called 'reinforcement,' 'upgrading,' 'boosting,' etc.). Caffi (1990) proposes the superordinate category 'modulation' to refer to both directions of modification.

In the case of weakening, in particular mitigation, some questions arise; these may be grouped in three sets. The first set is relevant from a descriptive viewpoint and can be formulated as follows:

- i. Leaving aside the important role played in mitigation by nonverbal means (in particular, proxemic and kinesic cues, such as smiles, gestures, postures, etc.), what are the kinds of mitigating devices that a natural language offers as resources for situated interaction? Are they mainly lexical, morphological, syntactic, or prosodic? Which combinations of different devices are more often attested in use? Is it possible to map types of mitigating strategies onto types of interaction? Is it possible to discover significant distributional constraints on mitigating devices and strategies used for performing different (macro-)types of illocutionary acts?

The second set of questions, at a higher level of abstraction, can be summed up as follows:

- ii. What is it that is weakened by mitigators? In other words, what is the linguistic scope, whether lexicalized or not, that is affected by the mitigating operation? Is there a correlation between the abstract scope of the linguistic mitigating device and the inferrable effect with respect to the value assigned to a given interactional dimension? What modifications are a matter of degree and what a matter of type? How do different kinds of mitigating devices interact? With which results? It should be noted that these questions are not abstractly speculative but have a direct bearing on the analysis of data.

A third set of questions is theoretical in nature:

- iii. What are the types of presuppositions or illocutionary felicity conditions that are influenced by attenuating modulations? (see **Pragmatic Presupposition**.) Is it possible to envisage significant connections between types of mitigation and different types of speech act felicity conditions?

Research still has to provide satisfactory answers to these questions, which need both an adequate theoretical framework and an adequate empirical grounding in different cultures/languages in different interactional contexts for different illocutionary acts. From a theoretical viewpoint, research conducted so far on various languages has shown that a systematic treatment of mitigation requires the integration of a speech act theoretical approach with other frameworks that take into account both the sequential dimension of discourse and the type of encounter in which mitigation is enacted.

The main question (which is far from being answered) regards the co-variance of variables involved in mitigating processes. From a methodological viewpoint, a first typological distinction needs to be made between form and function, between the formal means of the attenuating operation and its function in mitigation. As to form, research into various languages has shown that lexical and morphosyntactic mitigators are often employed in combination. While some mitigators are special to particular illocutions, so much so that they can be described not only as mitigating devices, but as illocutionary devices in their own right (e.g., *please* both functions as mitigator and indexes a speech act as a request), other mitigating devices can be called *passee-partout* mitigators (e.g., *a bit*, *a moment*), which are employed across a whole range of illocutions. As to function, the typologies of mitigators proposed by different authors converge in identifying, within the utterance, two abstract scopes to which the mitigating operation applies, i.e., proposition and illocution. Operating on the former, mitigation produces vagueness; operating on the latter it produces indirectness. A third scope can be added to these two, namely the deictic origin of the utterance (Bühler, 1934): the detachment of the utterance from its actual utterance source, as it happens in impersonal constructions, works, too, as a mitigating device (Haverkate, 1999). Deleting the source of the utterance and assigning it to other sources is a very frequent strategy by which speakers avoid taking responsibility for their speech acts.

As to the results of mitigation (in the second sense of the term, mentioned at the outset), they are at the same time calculable and uncertain. This holds not only in the general sense that perlocutionary acts and their perlocutionary effects, not being conventionally determined, cannot be foreseen, but also in the sense that mitigating operations may produce a margin of uncertainty, even with respect to the locutionary act, i.e., the intended act of reference and predication. In this respect, a syntactically negative structure, for instance a litotes (e.g. *John is not particularly bright*) can be described as a mitigation from a formal viewpoint (cf. Giora *et al.*, 2005); however, from a functional

viewpoint, it can be attenuating (similar in that to a 'true' minimization) or reinforcing (similar in that to an hyperbole), the latter function being the one assigned by classical rhetoric to this figure of speech. In addition, it is ultimately up to the hearer to work out not only the illocutionary force of the utterance, but also its propositional content (in speaker's opinion, is John too uptight for his role, a bit shy, or just dull?).

The conclusion is that the privileged object of analysis in the study of mitigation processes should be *form*, i.e., the linguistic expressions and structural patterns of discourse in a given (macro- and micro-)context. A pragmatic analysis of each of these forms, at different degrees of conventionality, will show the interplay of heterogeneous communicative dimensions.

Research Perspectives

Mitigation lies at the core of what can be called the rhetoric of everyday interaction. This rhetoric plays out against the background of our metapragmatic awareness (see **Metapragmatics**), i.e., our knowledge of what is appropriate to a given communicative situation. Mitigation is a relative concept: something is always mitigated with respect to something else. Within a repertoire of possible communicative choices which shape interactional styles in activity types, some choices will be preferred. For this reason, mitigation can only be defined contextually and co-textually within the global (and locally managed) system of the interactants' mutual expectations (see **Context, Communicative**). Hence, mitigation raises the issue of a complex system of knowledge, encompassing attitudinal and emotive factors: about the world, about the words, about ourselves, and about our interlocutors. It can only be dealt with satisfactorily when all these aspects (macro- and micro-sociocultural, linguistic, psychological, relational) and their interplay are considered.

As a concept that captures the rhetorical, indexical quality (see **Deixis and Anaphora: Pragmatic Approaches**) of our communicative behaviors, mitigation cannot be fully accounted for by an exact, abstract definition or strict classification: such techniques are only possible for decontextualized units. Precisely because of its rhetorical nature, ambivalence is its inherent quality: an antiphrastic tension, even a slight paradoxical current, runs through mitigation. After all, if someone mitigates, it means that there is something to be mitigated: where everything is (interactionally) 'safe,' there is no need of mitigation.

So far, mitigation has been a subtopic of the wide field of research in politeness and its dominating metaphor of 'face.' In Caffi (1999, 2001, 2008), an

extended view of mitigation is put forward: mitigation is defined as a weakening of one or more heterogeneous interactional variables (e.g., commitment to the proposition, degree of (in)directness of the illocution, endorsement of a social role, emotive involvement, topical salience, etc.), which constitute the system of an encounter. The predominant currents in pragmatics have been sociologically oriented. In accordance with their emphasis on the cultural and social aspects of the construction and negotiation of meaning, the notion of mitigation as a type of strategic behavior in a goal-oriented activity has been foregrounded. What so far has remained in the background is the psychological side of this meaning-construction that can be summed up in the question: In a given encounter, what kind of person would I like to be taken as? What is the relationship between the use of different types of mitigation and speakers' constructions of the 'self,' i.e., their self-presentations beyond mere face-work? What is the impact of mitigated choices on the process of interlocutors' mutual attunement (Caffi, 2008). An integrated approach does not dismiss the sociological view, but emphasizes the need to take the personal, psychological, emotive dimension into account. The model speaker of pragmatics is, at present, a *face*. This 'face' should be seen as belonging to a *person*, viz., a complex speaking subject endowed with a metapragmatic awareness covering social as well as cognitive and emotive discursive competences. In mitigating processes, there seems to be another motivational factor, more basic than politeness, i.e., minimizing responsibility. By mitigating, a speaker can avoid running unnecessary risks. Once again, it becomes clear that 'saying is doing'; as a type of doing, saying presupposes rights, implies risks, triggers obligations, produces effects, and changes contexts. Far from being relegated to some kind of stylistic variation or assigned to some province of (classic or new) rhetoric, mitigation is directly linked to the optimization of the system triggered by an encounter; it smooths out the interactional processes by presenting the speaker as considerate, tactful, thoughtful, and empathetic, and thus makes the attainment of interactional goals easier. In conclusion, mitigation both presupposes and reaffirms the multidimensional character of actual discursive choices, and foregrounds our identities both as social actors and as interacting persons.

Morphopragmatics

Definition

Morphopragmatics is a subdiscipline integrating morphology and pragmatics. It describes grammatical morphological phenomena (within both word formation and inflection), capable of systematically contributing autonomous pragmatic meanings to discourse.

Morphopragmatics is definable as the set of general pragmatic meanings/effects obtained by morphological rules. The privileged objects of a morphopragmatic description are evaluative suffixes, such as diminutives, as in Portuguese *adeuz-inho*, Spanish *hasta luego-ito* both 'good-bye-DIM,' augmentatives, as in Spanish *cabez-ota* 'big head'; Portuguese *animal-aço* 'huge animal,' elatives, as in Italian *fort-issimo*, 'very strong,' but also reduplicatives, as in Italian (*occhi*) *neri neri* 'very dark (eyes),' excessives, as in German *das Aller-schlecht-este* EXC-bad-SUPERL 'the very

worst,' and, within inflection, personal pronouns of address and Japanese honorifics.

The model fills in a gap concerning meanings not systematically dealt with by linguists, although influential in interactive discourse. Evaluative/alterative affixes, the major representatives of the central category investigated by the model, are characterized by semantic elusiveness, i.e., they exhibit no stable semantic value in terms of either denotations or connotations, and their meaning contributions to the speech event are better described within pragmatics, e.g., in terms of their dependence on speech situations, speech acts, attitudes of interactants. Due to lack of semantic stability, their meanings have been granted sporadic and impressionistic descriptions by morphologists. Pragmaticists, on the other hand, have overlooked morphopragmatic meanings as these are often overridden by the general pragmatic impact of the word meanings or, even, of the syntactic construction, which is perceived as more influential in terms of pragmatic constraints. For example, in a request such as *wouldn't you read this book-let* (a thick volume!) *for me?*, the diminutive *book-let* is pragmatically intended to downgrade the load of the request, but the *wouldn't*-construction is capable of the same effect and may darken the pragmatic contribution of the suffix *-let*. Morphopragmatics is intended to shed light on cases of exclusive relationships between morphology and pragmatics. It is a framework for describing cases of grammaticalized (i.e., morphologized) pragmatics, i.e., pragmatic effects produced by grammatical operations. The model marginalizes extra-grammatical phenomena, as in, for example, English reduplicatives (*teeny-weeny*) or slangy formations (*lanky* ← 'Lancashire'), although these obtain similar discursive effects because they belong to a heterogeneous group of word-forms admitting irregularities in their coining.

The Theory

The theory was pioneered by Wolfgang U. Dressler and Lavinia Merlini Barbaresi in successive steps (Dressler and Merlini Barbaresi 1986, 1987, 1991), and expanded into a fully fledged model in 1994. It started with the observation that some still productive elements, Italian interfixes such as *-ic-*, *-ol-*, and *-e/ar-*, placed before evaluative suffixes (as in *brutt-ar-ella* 'ugly-INT-DIM' 'not exactly nice'), retained some pragmatic effects as a remnant of their former status as suffixes, although, synchronically, they were semantically empty, i.e., denotationally meaningless. The investigation of such effects prompted the authors' interest toward the entire paradigm of evaluative suffixes. Predictably, meaningful suffixes also had a privileged and autonomous relationship with

pragmatics. It is in this area that morphopragmatic studies achieved their most fruitful results. Other applications are Dressler and Kiefer (1990) on German and Hungarian excessives, Kilani-Schoch and Dressler (1999) on French *-o* suffix, Crocco Galéas (1992) on Italian ethnics, Merlini Barbaresi (1999) on English *-y/ie* suffix, and more recently Cantero, 2003 on Spanish phenomena.

Morphopragmatics is parallel to other well-established subdisciplines, such as morphosemantics, lexical semantics of morphology, lexical pragmatics of morphology, and pragmatics of syntactic patterns and textual strategies, but it is to be carefully distinguished from them:

- Morphosemantics studies the semantic meanings of morphological rules, i.e., the regular denotational and connotational modifications obtained by derivational or inflectional rules. Within a morphosemantic investigation, pragmatic variables connected with speech situations become irrelevant. Reference to a pure denotational meaning of smallness added by a diminutive suffix, as in *room-ette*, belongs here.
- Lexical semantics of morphology deals with the denotational and connotational meanings of single, morphologically complex, words, as lexicalized *star-let*.
- Lexical pragmatics deals with the pragmatic meanings idiosyncratically conveyed by single complex words, such as lexicalized *bunn-y* 'rabbit,' selecting a child environment and obtaining a meaning of endearment.
- Syntactic patterns and textual strategies may convey pragmatic meanings of their own and interfere with those obtained by single constituents of the text.
- Morphopragmatics deals, instead, with pragmatic meanings that can be regularly obtained through the sole application of morphological rules, given certain sets of contextual conditions. The morphological operation may be totally responsible for the added utterance meanings, with the wordbase being either neutral (*dogg-y*) or contributory (*dear-ie*, Italian *piccol-ino* 'small-DIM') or even contrary (Italian *gross-ino* 'big-DIM') to the effect pursued.

The Tenets of the Theory

The theory relies on the assumption that pragmatic meanings are not completely derivable from semantic meanings with the help of general pragmatic principles; it favors the claim that a morphopragmatically relevant rule possesses some nonsemantic, autonomous pragmatic feature in its meaning description. In the case of Italian diminutives, for example,

the pragmatic effects they obtain cannot be derived from a semantic meaning [small] with its alloemes [unimportant] and [young]. They are based on an autonomous pragmatic feature [fictive], and on a derived, more specific character [nonserious]. Evidence of that is the fact that many of such pragmatic effects can also be obtained by augmentatives, which share with diminutives the pragmatic feature [fictive], but certainly not the semantic meaning [small]. In Italian, saying to somebody:

- (1) *mangi come un maial-ino*
you eat like a pig-DIM
'you eat like a little piggy'

would not sound dissimilar from:

- (2) *mangi come un maial-one*
you eat like a pig-AUGM
'you eat like some huge pig'

In both cases, the suffix is capable of hedging the critical remark, i.e., of downgrading the illocutionary force of the evaluative assertion, via a playful character added. Compare with a nonsuffixed version:

- (3) *Mangi come un maiale*
'you eat like a pig'

which is insulting and likely to cause an angry retort by the addressee.

The playful character, on the other hand, cannot be viewed as a stable connotation of the two suffixes, because, with a change of context (e.g., a sarcastic approach), the same suffixes may turn their meanings into aggravating unpleasantness. See:

- (4) Italian: *vuoi tener fuori le tue man-ine/one dai miei affari, per favore?*
will you keep out the your hand-DIM/AUG-PL from the my business-PL, please?
'why don't you mind your own bloody business'

Fictiveness is conceptualized as a departure from conventionally accepted standards of meaning; it generates a frame of personalized values where such standards glide according to the speaker's evaluation. Fictiveness creates an area of fuzziness, which, in interactional discourse, needs explanations and allows negotiation, as in:

- (5) Italian: *il tuo articolo è un po' cort-ino*
the your article is a little short-DIM
'your article is a bit short, I'm afraid'

A likely rebuttal could be:

- (6) *che intendi per cort-ino?*
what do you mean by short-DIM?

The use of the un-affixed base *corto* (as in *l'articolo è corto* 'the article is short'), by contrast, would

activate conventional standards and would not allow meaning negotiation; it might at most trigger a discussion on what is 'short' for an article, due to the meaning relativity of dimensional adjectives.

In Italian, but also in other languages, such as Spanish, Portuguese, German, English, Dutch, Polish, Russian, and others, a diminutive formation produces modifications that may be at the same time relevant for morphosemantics, i.e., denotational diminution and positive or negative connotations, and for morphopragmatics, i.e., fictiveness and its derived character [nonserious], capable of constraining the type of speech situations and of downgrading the strength of the illocutionary force of the entire utterance. So, in the Italian example above, the diminutive formation *un po' cort-ino* 'a bit short-DIM', besides conveying a meaning of semantic diminution, by virtue of its fictive and nonserious character, suits a case of non-official evaluation, indicates the speaker's lower responsibility in uttering it and obtains mitigation of the critical remark.

Morphopragmatic effects may even be independent of the denotative meaning of smallness and of connotational meanings of positivity (pleasantness, coziness, etc.), or negativity (meanness, meagerness), or emotionality (endearment, tenderness). Cases are conceivable in which none of these meanings is actually activated and still morphopragmatic effects obtain, as in:

- (7) Italian: *ho bisogno di una sua firm-etta qui, per favore*
I have need of a your signature-DIM here, please
'well, now, could you just sign here, please?'

where the meaning [small] of the suffix in *firm-etta* is suspended and superseded by its feature [non-serious], which lowers the speaker's responsibility for the face-threatening directive speech act and obtains a downgrading of the deontic imposition of the request and of the requestee's liability in case of noncompliance.

A fictive character is recognizable also in other morphological rules, as, for example, in German and Hungarian excessives. From a semantic viewpoint, excessives are not different from superlatives: like these, they indicate the highest possible degree of a value along a scale, but excessives obtain a fictive upgrading of this extreme, which can be exploited, for example, in paradoxical or sarcastic hyperboles, as in:

- (8) German: *aber das Aller-schön-ste kommt erst jetzt*
but the EXC-beautiful-SUPERL comes only now
'but the most beautiful of all is about to come up now'

where 'beautiful' is used sarcastically of something unpleasant.

The model also concerns morphopragmatics in inflection, as, for example, Japanese honorifics, particularly the suffix *-masu*, which indexes social and psychological distance in conversation. The honorific system is a matter of morphopragmatics because its sociopragmatic meaning is biuniquely expressed by such suffixes.

New, promising areas of morphopragmatic studies have recently opened up, for example in language acquisition (Dressler, 1997).

Factors Favoring Morphopragmatic Meanings

Child-centered speech situations and the emotionality involved, the ludic character of playfulness among intimates, familiarity and informality in general, sympathy and empathy, but also understatement, euphemism, false modesty, irony and sarcasm, are all factors favoring morphopragmatic meanings of diminutive formations and other morphological rules. In a child-centered speech situation, the feature [nonserious] is constitutive and triggers diminutive formations. Examples are:

- (9) who's my lovely little girl-ie?

German: wer komm-erl-t denn da?
who come-DIM-s PART there
'who is that cute boy/girl is coming there?'

involving emotions and signaling intimate relations between mother and child. The other factors, such as irony, understatement, etc., are regulative. Compare:

- (10) Italian: un tantino anziano per lei, no? (irony)
a bit-DIM old for her, no?
'a shade old for her, eh?'

- (11) Italian: io facevo un ragionamento un po' divers-ino (understatement: downgrading speaker's responsibility; said by a student to a professor)
I made a reasoning a bit different-DIM
'I was approaching the matter slightly differently'

Emotive factors are not primarily connected with diminutive formations, as can be seen from the last

example. Constitutive and regulative factors combine in determining the application of the rule, which is also dependent on whether the utterance contains a suitable base for the suffix. Whatever the word chosen as a base ('landing site'), the effects clearly extend to the entire utterance.

Morris, Charles

M Nett, Bucharest, Romania

© 2006 Elsevier Ltd. All rights reserved.

Charles William Morris was born in Denver, Colorado on May 23, 1901 and died in Gainesville, Florida, on January 15, 1979.

He studied at the University of Chicago, and received his Ph.D. in philosophy in 1925. His academic career included the jobs of instructor at the Rice Institute (1925–1931), Associate Professor (1931–1947) and lecturer (1948–1958) at the University of Chicago, and Research Professor at the University of Florida. He also taught at Harvard and at the University of Texas.

In 1934, Morris edited the collection of lectures *Mind, self, and society* by his former Professor George Herbert Mead.

Morris was interested in logical positivism, and in scientific empiricism as promoted by the Vienna Circle. He dealt in formal logic (along the line inaugurated by Rudolf Carnap), behavioral psychology, and language philosophy. He participated in the international congresses of the philosophy of science (Prague 1934, Paris 1935).

From the beginning of the 1930s, Morris gave the very first course in semiotics (so labeled). He assumed the existence of a close interdependence between science and semiotics. Consequently, in his first major work, *Foundations of a theory of signs* (1938), Morris claimed that science is “at once a language, a knowledge of objects, and a type of activity.” The *Foundations* were originally intended as the first volume of an *International encyclopedia of unified science* (a project promoted by Neurath and Carnap). Following upon ideas due to Charles S. Peirce (whom he never met), Morris’s basic contribution in this work is the tripartition of semiotics into syntactics, semantics, and pragmatics. This distinction was also adopted in linguistics. Pragmatics, as studied by contemporary linguistics, originates in Morris’ idea of a branch of semiotics concerned with “the relations of signs to their interpreters.”

His next major work was *Sign, language, and behavior* (1946), which developed along the same lines.

In 1964, he published *Signification and signification*; the basic idea thereof is that semiotics studies

“what signs signify to certain persons, how signs are considered in a specific language, the origin, uses, and effects of specific signs.”

Morris organized the 5th and 6th International Congress for the Unity of Science. He was Fellow of the American Academy of Arts and Sciences, and President of the Western Division of the American Philosophical Association (1936–1937).

In 1977, *Ars Semeiotica. International Journal of American Semiotics* was launched at the University of Colorado, under the patronage of Charles W. Morris.

Multiculturalism and Language

J Edwards

© 2006 Elsevier Ltd. All rights reserved.

This article is reproduced from the Concise Encyclopedia of Sociolinguistics, pp. 48–50, © 2001, Elsevier Ltd.

Focusing upon linguistic and cultural contact means focusing upon group identity. It is this sense of 'groupness' – ethnic or national – and the recognition that both underpins and reflects it, that constitute the core of the discussion on multiculturalism, a discourse that is essentially sociopsychological and usually emotionally charged. This can be true from either side of group boundaries: linguistic and cultural continuity, for example, can be both a rallying point for members of a beleaguered minority and an irritant (or worse) for those fearful of social balkanization or fissiparous movements. Multiculturalism is an icon for some, an illusion for others. And language – particularly in its symbolic roles, as well as in those communicative ones that link past to present, that bear culture across generations – is in many instances the centerpiece of the multicultural thrust. During and after language shift, it is certainly possible to maintain cultural distinctiveness and the sense of border that is the heart of group definition. However, this is not a viewpoint likely to be endorsed by people who feel themselves at risk of assimilation, nor can it be denied that continuity of language use is a powerful cultural buttress.

The politics of identity – the skeleton, that is to say, which is fleshed out by cultural and linguistic differences, details, and demands – is of special current salience. Our age is one of transition, and transitions are often difficult and painful. In the territories of the former Soviet Union, in the increasing western European federalism, in the killing fields of Africa – but also in the struggles of indigenous peoples in North and South America, in the debates on multicultural accommodations in new-world 'receiving' societies (Canada, Australia, the United States) – we see contexts in flux, identities up for renegotiation, languages in contact or conflict, 'small' cultures attempting to resist larger ones, and so on. It is true that, in some cases, the 'ethnic' factor in conflict is something of a red herring. The Hutus and the Tutsis of Rwanda essentially share the same culture, religion, and language and, consequently, ethnic difference was not the real nub of the conflict that led to the massacres in 1994. In Africa, Asia, and elsewhere, colonialism planted many delayed-action devices, emphasizing and stiffening cultural difference. But even if ethnic or nationalist roots are not, in themselves, causal phenomena (in situations of group friction),

their very existence – the fact that they are *there*, the fact that dormant, or even unreal, traditions can be evoked and played upon, the fact that manipulated or selective history can be made to serve current ends – is of considerable importance. In some other cases, matters of language and culture are not only symbolic markers signaling deeper waters, but are more centrally implicated in intergroup conflict. It is not economic deprivation or lack of effective political representation in federal corridors that primarily fuels the sovereignty movement in Quebec – yet its power has come within a hair's breadth of breaking up the country.

Multiculturalism usually implies multilingualism and, at a *de facto* level, they exist in virtually all countries, in very few of which national and state borders are coterminous (see Connor, 1978). At a *de jure* level, languages are more often accommodated than are cultures. Still, despite a large number of languages and a small number of states – about 5000 and 200, respectively – only about a quarter of the world's polities recognize more than one language (and recognition itself rarely implies or reflects equivalent status; see Edwards, 1995).

Legislated attention to cultural diversity is rare, and Canada and Australia are virtually alone in having official multicultural policies. The Canadian approach is generally illustrative. Two years after the establishment of linguistic duality (with the Official Languages Act of 1969), a policy of multiculturalism was announced, and an Act was passed in 1988 – the aims were, from the first, to assist cultural groups to develop and to contribute to the larger society, and to help them learn either or both of the two official languages. Further elaboration (as found in the Act) stressed the preservation and enhancement of other languages – but this is supposed to coincide with the strengthening of English and French, too, the national commitment to which is reaffirmed. The Canadian policy demonstrates, then, the generalities employed when cultural maintenance or the continuity of non-official languages is under discussion (the Act talks of enhancing the Canadian 'multicultural heritage'), as opposed to the specificity attaching to the status of legally sanctioned varieties. Unsurprisingly, this package has been seen as rather an empty one; more pointedly, the feasibility of multiculturalism within a bilingual framework and the depth, therefore, of real government commitment has been questioned. Of course, reactions to official multiculturalism range very widely, from the mistaken notion that it is a spur to ethnic separatism and an impediment to national unity (perhaps, indeed, to the emergence of some

eventual, nonhyphenated Canadian identity), to the naïve belief that it enshrines and reflects a general tolerance for diversity – evidence for the moral superiority of the Canadian ‘mosaic’ over the more southerly ‘melting pot.’

But the Canadian policy, for all its generality and its possible interpretations, is more broadly significant as an example of political response to diversity. Liberal democracies are of course obliged by deepest principle to consider multicultural realities – but consideration does not imply uniformity of sensitivity or reaction. In the Canadian approach to multiculturalism, an apparent response at the level of the group, the collectivity, is arguably of such a general nature (and, one should add, is so weakly supported, financially and otherwise) that it represents only a tiny course adjustment to the more traditional liberal stance in which rights are seen to inhere in individuals, a stance broadly descriptive of contemporary Western society. So, to the reactions already mentioned, we can add two further interpretations of multicultural policy: it represents only politically opportunistic lip service to the idea of cultural maintenance (a view which could of course be endorsed by the cynical assimilationist); or, it is a genuine response to heterogeneity, but one that is unfortunately flawed in its framing and its application. It need hardly be said that these and other stances are not unique to the Canadian context.

The appropriate democratic response to cultural diversity is of course the underlying issue here. Should there be formal multicultural policies at all and, if so, should they enshrine some level of commitment to group rights? What level? And what groups? The literature on multiculturalism and its ramifications – pluralist accommodation, the negotiation of identity, the rights of minorities, the obligations of the liberal state, and so on – has only recently turned to such matters. The turn, however, has been significant, and there is now a concern for ‘identity’ that extends from literature, to the social and political sciences, to philosophy.

In his treatment of ‘identity politics,’ Taylor invokes the idea of ‘recognition’ and, more specifically, the politics of equal recognition as fundamental. But this can shade easily into a politics of group difference, in which the uniqueness of group identity is emphasized. It is this, of course, that adherents claim is at risk of being ignored or, worse, assimilated to some overarching majority (the “cardinal sin against the ideal of authenticity”: Taylor, 1994: 38). So we arrive at an interesting juncture: the principle of universal equality is stressed but within that, as it were, arise demands for the recognition of distinctiveness. The demands of general respect, on the one hand, and of particularity, on the other, lead to difficulties:

The reproach the first makes to the second is just that it violates the principle of nondiscrimination. The reproach the second makes to the first is that it negates identity by forcing people into a homogeneous mold that is untrue to them. (Taylor, 1994: 43)

Bearing in mind the traditional liberal sense that society ought to ensure individual equality but remain neutral as to the desired contents of lives, but aware of the concerns of cultural collectivities (especially, of course, those under threat from powerful neighbors), Taylor argues for a more ‘hospitable’ liberalism that departs somewhat from this traditional neutrality, for the idea that cultures should be given some means of self-defense, for at least an initial presumption of equal worth – for something, that is, between a cruel homogenization and an ethnocentric self-immurement.

Kymlicka (1995) has also addressed the matter, arguing that it is within the bounds of liberal democracy to provide groups with the means to ensure their cultural continuity – and, where these groups are specially disadvantaged, this may in turn require special attention, perhaps special rights. In this connection, he defends treatment differentiating between indigenous minorities and immigrant groups. Kymlicka (see also 1998) has concerned himself particularly with the Canadian context, suggesting that the multicultural policy is – or could be – an effective instrument. It is interesting (given what I have noted above) that he repeatedly points out that this policy, now to be understood as a vehicle for the provision of group rights, is, after all, no real threat to the *status quo*. Diversity will be subject to reasonable limits, and existing conceptions of rights, freedoms, and human dignity will not be overturned.

It is impossible to analyze here the rich detail of these sorts of arguments (or, indeed, to note the criticism they have elicited). But they are the ones we now need, since they confront the underpinnings of multiculturalism and may thus lead to useful generalities applicable across contexts. A great deal of the literature has, for too long, consisted of special pleading for one group or another, under the guise of a broad concern for pluralist accommodation. A more profound assessment of multiculturalism will necessarily involve its linguistic components, and that is why I have emphasized the former in this brief discussion. It is of course possible to attend to language *per se* without much concern for its cultural foundations. But an instrumental approach omits the essence of the matter here: the interweaving of language as a strand in the larger fabric, as part of a broad concern with identity and belonging.

Narrative: Sociolinguistic Research

J Smith, University of York, York, UK

© 2006 Elsevier Ltd. All rights reserved.

Labov and Waletzky, 1967

In the sociolinguistic quest to ‘tap the vernacular’, one of the richest sources of data comes from narratives of personal experience (Labov, 1972; Labov and Waletzky, 1967). As the narrator becomes immersed in the details of the narrative itself, he is “no longer free to monitor his own speech as he normally does in face to face interviews” (Labov, 1972: 355), hence mitigating the ‘Observer’s Paradox’ (Labov, 1970: 32). Thus, this type of data provides a wealth of largely unmonitored speech amenable to analysis of variable lexical, phonetic, and morphosyntactic forms. However, these narratives of ‘ordinary people’ (Labov, 1997: 397) which are commonplace in sociolinguistic data, have a more intrinsic interest: the internal structure of the narrative itself. These funny, tragic, trivial tales may appear to be idiosyncratic to the individual narrator, but despite their disparity vis-à-vis content and style, similarities in linguistic structure and function abound.

In an attempt to uncover the underlying mechanisms at work in the course of telling and retelling narratives of personal experience, Labov and Waletzky (1967: 12) propose an analytical framework which isolates “the invariant structural units which are represented by a variety of superficial forms.” In other words, the deep level structures which map onto surface-level variations. Although this framework is nearly 40 years old, it “continues to dominate the field,” (Macaulay, 2002: 289) alongside more wide-ranging treatments of narrative (e.g., Prince, 1983; Linde, 1993). It has thus remained the bedrock for sociolinguistic narrative analysis over the last few decades.

Fundamental to this framework is (1) the clause as a grammatical unit, and (2) the semantic functions of these clauses. The individual clauses are grouped into sections which have different functions within the story. Labov (1972: 359–360) defines narrative

as “one method of recapitulating past experience by matching a verbal sequence of clauses to the sequence of events which ... actually occurred” (see also Labov and Waletzky, 1967: 201). A minimal narrative contains “a sequence of two clauses which are temporally ordered” (Labov, 1972: 360–361), as in (1) and (2):

- (1) and I took his nappy off
and as I took it off literally he pooped all over the cubicle!
- (2) and then his mum and dad woke up
and Mel punched his dad

(All examples come from a large number of narratives collected at the University of York (Smith *et al.*, 2002–2004) by students enrolled in the course Variationist Narrative Analysis).

These chronologically ordered clauses, or **complicating actions** (Labov and Waletzky, 1967: 32) provide the **referential** function of the narrative, reporting ‘a next event’ in response to the potential question ‘What happened [then]?’ (Labov, 1997: 402). They provide the backbone of the story and are the ‘most reportable event’ (Labov, 1997: 404): without these, there is no narrative. (The complicating action is often terminated by a result or resolution, “the set of complicating actions that follow the most reportable event” (Labov, 1967: 414).

However, most narratives are not this minimal, and, significantly, one “which serves this [referential] function alone is abnormal: it may be considered an empty or pointless narrative” (Labov and Waletzky, 1967: 13). In addition to the question ‘What happened next?’, we also want to know ‘What’s the point?’. Labov refers to this as the **evaluative** function of the narrative.

Evaluation clauses in a narrative contain statements or words that tell the reader what to think about a person, place, thing, event, or entire experience. They are “the means used by the narrator to indicate the point of the narrative, its *raison d’être*: why it was told, and what the narrator is getting at” (Labov, 1972: 366). They give the story reportability and make it worth telling. These clauses can be highly

embedded within the narrative itself and can include evaluation of a third person as in (3).

- (3) And so he said in future years he'd only shag actresses.

On the other hand, it can be a much more direct statement about the narrator's feelings, as in (4):

- (4) They've just got absolutely no scruples about owt.

The circumscription of evaluation, both structurally and semantically, has proved to be the most problematic. Its defining qualities underwent substantial revision in Labov (1972) and Labov (1997).

Added to the referential and evaluative function of narrative are orientation, abstract, and coda.

The **orientation** section of a narrative contains statements that provide the setting or context of a narrative which "serve to orient the listener in respect to person, place, time, and behavioral situation" (Labov and Waletzky, 1967: 32), as in (5):

- (5) and he used to drink Lowenbrau
and he used to like ten pints every night
and at the weekends he'd get so drunk he couldn't stand up.

The **abstract** "is an initial clause that reports the entire sequence of events of the narrative" (Labov, 1997: 402) in summary form, as in (6):

- (6) Last time I got pulled it were for drink driving.

In other cases, they are requests for an extended turn at talk, as in (7):

- (7) So did you hear about the gas leak?

These often act as some type of advertisement in order to 'get the floor', as in (8):

- (8) Right, I can tell you a birthday story and a half!

The **coda** is "a functional device for returning the verbal perspective to the present moment" (Labov and Waletzky, 1967: 39). These clauses often employ deixis, as in (9), or make the effects of the narrative applicable to the here and now, as in (10):

- (9) Erm, and that was it. That was me getting arrested for fraud.
(10) So we live and learn and I shall never ever move a static caravan again.

These five major sections most often follow a linear structure: the story opens with the abstract, followed by some orientation clauses and then the complicating action, while the coda signals closure. Evaluation clauses are interspersed throughout this bounded unit.

In discourse level phenomena, "narrative is the prototype, perhaps the only example of a well-formed speech event with a beginning, a middle, and an end" (Labov, 1997: 396). Moreover, they have "a fairly regular structure that is largely independent of how they are embedded in surrounding talk" (Schiffren, 1994: 284). Although there are differences, both structurally and functionally, in how a narrative is realized, the study of a large body of narratives have demonstrated that this structure is fundamental to the majority of narratives of personal experience, it is the 'normal form' (Labov and Waletzky, 1967: 40).

Sociolinguistic Correlates

Although Labov and Waletzky's prime motivation in the 1967 paper was the narrative itself, one of the 'ultimate aims' was to "require close correlations of the narrator's social characteristics with the structure of their narratives" (Labov and Waletzky, 1967: 13). Since that time, a number of classic sociolinguistic categories have been examined against the backdrop of narrative: in particular class, gender, geography, age, and ethnicity.

Class

Labov (1997: 412) observes class differences in narrative: upper middle class speakers report on emotions, while lower class speakers "are sparing in their reporting of subjective feelings." Horvath (1987: 219) also finds differences in content: the majority of working class speakers' stories concern themselves and other family members; in middle class speakers' narratives, protagonists not personally known to them predominate.

Class differences may also exist not only in content, but in quantity, too. Macaulay's (1991: 139) study of Ayr in South West Scotland shows that working class speakers have on average a greater number of narratives both in number terms and as a proportion of the overall sociolinguistic interview than their middle class counterparts. This finding was replicated in his study of Glasgow speech (Macaulay, 2002: 298).

Gender

Labov and Waletzky make no explicit reference to gender differences in narrative, but it, too, may have an impact on content. Findings from Johnstone's (1990: 66) study of middle class whites in Fort Wayne, Indiana, suggests that men's narratives focus on their personal exploits and successes, whereas women underplay the 'protagonists' personal roles.' Holmes' (1997: 286) results from the Wellington Corpus of Spoken New Zealand English are similar:

“the women focus on relationships and people, affirm the importance of their family roles, family connections, and friendships. The men focus on work and sport, events, activities, and things, and affirm the importance of being in control, even when they don’t achieve it.”

Cheshire’s (2000) research into the narratives of teenage friendship groups in Reading also finds gender stratification in how stories are co-narrated: in a nutshell, “for the boys, the telling was the more salient aspect of a narrative, whereas for the girls it was the tale” (Cheshire, 2000: 200).

Age

Labov (1972: 393–396) finds that the ability to narrate evolves with age. This is supported in subsequent research (e.g., Peterson and McCabe, 1983; Bamberg, 1997; Toolan, 1988). ‘Leap frog’ narratives are the most common among four year olds where the child jumps from event to event unsystematically. By six years old, the classic pattern established by Labov is more in evidence: temporal relationships have developed, but the referential function predominates, with little evaluative function evident (e.g., Peterson and McCabe, 1983), and a paucity of orientation clauses (e.g., Snow and Imbens-Bailey, 1997). In later years, there is a focus away from factual information to getting the point across, with an increasingly sophisticated use of evaluative devices with increasing age (e.g., Romaine, 1985; Kernan, 1977: 101).

Syntactic complexity increases with age from pre-adolescent to adult (Labov, 1972: 393), and remains stable in later years (Labov and Auger, 1993).

Ethnicity

Labov and Waletzky (1967: 38) state that their proposed framework “will achieve greater significance when materials from radically different cultures are studied in the same way.” Indeed, whether their framework is culture specific or universal has been the subject of scrutiny (e.g., Tannen, 1981, 1982, 1984; Blum-Kulka, 1993; Tsitipis, 1988). Divergences from the ‘expected’ model appear from the very earliest years. Michaels (1981, 1984, 1985) shows that “children from different backgrounds come to school with different narrative strategies” (Michaels, 1981: 423). White children have as a framework ‘topic-centered’ narratives which have minimal assumption of shared background, full description of objects, explicit spatiotemporal grounding; black childrens’ narratives are ‘topic associating,’ where the narrator presents “a series of implicitly associated personal anecdotes” (Michaels, 1981: 429). Ethnic differences are not restricted to children: Holmes (1997) finds in

her New Zealand corpus that Maori speakers, in comparison to their Pakeha counterparts, leave parts of the narrative relatively inexplicit, including the evaluation section.

Geography

Johnstone (1990) suggests that there are regional differences in discourse style explicable in terms of different cultural contexts. In her analysis of Indiana narratives, she finds that the narrators use highly specific details, or ‘extrathematic orientation’ (Johnstone, 1990: 201) in orientation sections of narratives. She interprets this within the context in which the narratives take place: they must be culturally embedded, or ‘anchored in the real, local world’ (Johnstone, 1990: 210) in order for the narratives and narrators themselves to sustain, in Labov’s (1997: 407) terms, credibility.

Linguistic Internal

The syntactic correlates of narrative structure are discussed in Labov and Waletzky (1967) and Labov (1972). Hopper (1979) and Hopper and Thompson (1980) also find that certain linguistic forms predominate in particular parts of the narrative: complicating action verbs are most usually punctual rather than iterative or durative and are usually perfective; stative predicates predominate in orientation; evaluation clauses are often irrealis, with use of modals, subjunctives, and negatives (see also Silva-Corvalán, 1983). These “predictable grammatical correlates not only for narrative type but also within narratives” (Fleishman, 1985: 852) are realized formally in some languages: for example, in Swahili, foregrounded clauses or complicating actions are marked with the prefix *ka-*, background with *ki-* (Hopper, 1979: 213). In other languages such as English, they derive from the discourse structure itself (Hopper, 1979) and are used as devices to signal levels of ‘information relevance’ (Fleischman, 1985: 852).

Variable morphosyntactic forms that cannot be explained at clause level may find interpretation within the broader discourse unit of the narrative. Schiffren (1981) finds hardly any use of the historic present in abstracts, codas, and evaluative clauses, and a minimal number in orientation. In contrast, almost one-third of complicating action clauses are in the historic present. The interpretation of these quantitative results relies on Labov and Waletzky’s model: as verbs in complicating action clauses are temporally ordered, they are free from providing a reference time, thus marking for tense is redundant (see also Johnstone, 1987; Wolfson, 1979; Silva-Corvalan, 1983).

Despite some findings on differential behavior across a range of sociolinguistic and linguistic internal categories, the foundations of Labov and Waletzky's framework remain largely unchallenged. In the field of sociolinguistics, they continue to provide a solid foundation for research into narratives of personal experience.

Narrativity and Voice

M Bal, University of Amsterdam, Amsterdam,
The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

‘Voice’ concerns the question ‘Who speaks?’ (who tells the story in a narrative?) and presupposes a pragmatic view of language. Hence, the concept of voice implies that any narrative is uttered by someone. Usually, one speaks of narratives ‘in the first person’ when the voice refers to itself and ‘in the third person’ when it does not and the narrative appears to just flow (Bal, 1996). More rarely, narratives are told ‘in the second person,’ so that the first person is strongly implied but not mentioned. An intermediate form is ‘free indirect discourse,’ where the narrative espouses the idiosyncrasies of the character closely without using the first-person pronoun. Voice is the concept that, in the wake of Roland Barthes, killed the author while enabling critics to continue analyzing texts by positing a ‘speaker’ who allegedly uttered them. At the time, many were preoccupied with the French tradition, and I was myself interested in emending Gérard Genette’s theory of narrative. At this time, I want to give some opacity to the perhaps too transparent veil of these alternative approaches, so that it helps to cast a somewhat amazed look at that key concept of voice. I will deprive the concept of its ‘naturalness’ and refrain from taking it for granted. Instead, I argue that ‘voice’ is an extremely artificial and skewed concept.

This reversal of what is ‘normal’ or ‘natural’ and what is *techné* or artifice accomplishes three things. It helps to suspend – but not give up – what seems ‘normal’ or even ‘natural’ in the equipment we have inherited from our training and from the traditions within which we work, including the concepts of voice and others we routinely work with and the methods learned and practiced. It suspends the certainties regarding the domains the humanities have accustomed all of us to consider **separately**: art, literature, film, and the ideas and images that run through philosophy and religious studies. Moreover, it questions the concept of voice as one borrowed from the domain of the **anthropomorphic imagination** and as deriving its apparent self-evidence from it.

Voice and Its History

The metaphor of ‘voice’ in literary studies came into use after the 1930s, in the wake of certain technological discoveries and developments. Neither of

the two earliest modern publications considered narratological – the collection of Henry James’s prefaces to *The art of the novel* from 1907 and E. M. Forster’s *Aspects of the novel* from 1927 – uses the term. James uses a remarkably **visual** vocabulary, whereas Forster uses the term ‘story-teller’ (Forster, 1974: 22–23) to refer to the author of narrative literature. When he uses the term ‘voice,’ he is referring either to tone (‘a tone of voice’ (Forster, 1974: 86)), or to the literal, physical voice. For example, he writes: “... the story as a repository of a voice. It is the aspect of the novelist’s work which asks to be read out loud.” (Forster, 1974: 27) But, though he does not use the concept in the analytical sense of later narratologists and linguists, his phrasing tells of the transforming meaning of voice in a culture about to embark on a ‘secondary orality,’ as radio and sound film became common. He writes, with a tellingly enthusiast primitivism:

What the story does do in this particular capacity [...] is to transform us from readers into listeners, to whom ‘a’ voice speaks, the voice of the **tribal** narrator, squatting in the middle of the **cave**, and saying one thing after another until the audience falls asleep among their offal and **bones** (Forster, 1974: 27, emphasis added).

The late 1920s and the 1930s would be the moment that the word ‘voice’ became replenished with sense and relevance in a culture that saw itself as modern. It is the moment that posed the problem of voice in the culture at large. Specifically, it was the moment, heavy with consequences, in the middle of the so-called modernist period, of the transition from silent to sound film (see Lastra, 2000).

Before that transition, the idea that images could have a voice was as utopian as it was exotic. The ‘movement’ of the image was already quite an impressive miracle, for which artists like Degas and photographers like Muybridge and Marey had prepared the public. To turn technological experiments into multimedia spectacles, pianos were put in the theater room. Sound was a luxury – decorative. It did not narrate. But one day, technology facilitated the transition that we now find so natural – from silent to sound film.

This was not a single transition. The particular moment I am interested in here is when sound began to transform from ornament to supplement, and before it became an integral element of the moving image. It is the moment when sound began to be ‘added’ to the image. The image was made first, and then sound was literally put together with it. The procedure of adding sound was jokingly called

'goat-glanding' (Armstrong, 1998). A generation later, the true wonderment of the procedure, its technological spectacularity soon forgotten, was evoked nostalgically in fictional form in the film *Singin' in the Rain* by Stanley Donen and Gene Kelly (1952; see Armstrong, 1998). This film can serve here as a theoretical object and contribute to an understanding of the full impact of the concept of 'voice,' which is not taken into account when it is used for narrative analysis.

In this film, play-acting without words, the 'original' or 'natural' form of the moving image is represented in all its fantastic splendor when Debbie Reynolds acts as an acoustic prosthesis to the 'mute' actress whose voice wouldn't 'pass.' Whereas Reynolds ends up achieving final victory, the class-bound censorship of her counterpart's voice exceeds the hilarious humor of the set-up of doubling and splicing between body and voice. It also puts the finger on what may well be called 'the politics of voice,' which would link this 'classism' to Forster's primitivism. In line with Schmid's narratological concept, we could speak here of 'voice-interference.'

'Goat-glanding' opened the possibility of a new engagement between language and image. This new engagement turned cinema into the third art. Neither literature nor visual art nor a simple combination of the two, cinema was a fundamentally different art where language and image were inextricably intertwined, along with other media such as music and space. From that position, cinema was able to cast doubt on the essentialism that sought to separate the media and consequently house them in separate disciplines.

In this culture, cinema had the role of cultural model that we are only now beginning to grant it, in its break with the idea of 'pure' media and its accession to the mass public, which accorded the masses the status of both consumer and **judge** of art. But this cultural situation also generated a crisis. I contend that the concept of 'narrative voice' is an instrument of the **repression** in that crisis and the crisis of authorial authority that it entailed.

This cultural crisis, which knocked absolute authority out of the hands of expertise, is also the crisis of the authority of the author. Barthes and Foucault drew only philosophical consequences from the technological change, and that, quite late, when they proposed the ideas of the dispersion (Foucault, 1979) and death (Barthes, 1986 [1968]) of the author. The moment of crisis had, in fact, already happened several decades before. The trigger was the cinema, recently furnished with a voice.

The metaphor of voice as technological would, for example, direct attention to the production of the

'diegetic chronotope' – the timespace in which the plot is set – as the domain of the effect of the real. Far from possessing an authority that goes without saying, narrative voice seen as 'addition' distracts attention from the total lack of authority of, to recall the example, Debbie Reynolds' character, in order to implement the diegetic fiction as the frame of viewing the work as a whole. That fiction draws the story into a chronotopological hole, from which, in general and with the exception of postmodern experimentation, it will not reemerge.

In this respect, again, the literalized revelation in the raising of the curtain in *Singin' in the Rain*, with its explicitly added voice, can serve as model. The identity of the woman 'who speaks' shows itself in a *mise-en-scène*, which is also a theoretical *mise-en-abîme* of the question, 'Who speaks?' Here, the *mise-en-scène* 'explains' why, in the history of cinema, the artificial character, the nonidentity, the 'added' quality of the voice, has been 'forgotten' so easily, so fast, and perhaps, so desperately.

In the cinema of former days, this technology had had its own materiality: sound, music, tools, and machines. But a new cognitive understanding also underlay that very materiality whose conception it had made possible because thinkable. That understanding is anchored in the sciences of the time. It concerned not the overestimation but rather the fundamental deficit of the body, so that it was seen as being in constant need of supplementation by means of prostheses, one of which was the voice. The concept of voice, disembodied, made technical, thus makes its appearance as a tool for analysis, as if to over-compensate for the anxiety triggered by a generalized sense of the body's defective state. A body part pried loose of its body.

In view of the fiction that proclaims the disincarnation of narration, one must take a position in the debate that subtends such an attitude towards voice. On the one hand, the concept of narrative voice is constructed on the presupposition of spatial distance. By not matching the images in any obvious way, the voice seems to lose its body. This loss brings it into the present of reading, where it partakes of the strong perceptual and affective experience. This, in turn, reincarnates the voice. But, on the other hand, in the very attempt to incarnate it, to give it body – for example, by marking its gender, age, and other social positions – the voice is deindividualized by the analyst who uses the term 'voice.'

Faced with these cases, where the concept of voice is artistically theorized as meaningful after all, it is necessary to 'work through,' put under erasure, those aspects of the metaphor of voice that distort and censure the analysis.

Images of Authorship

Among the aspects of the metaphor of voice that might have informed its creation and that remain its primary motor, is, first of all, the notion of the 'subject' as the owner or site of the narrative voice. This incites the analyst to privilege voice over other aspects of the fabric of the narrative text that contribute equally strongly to the production of its meaning. Most obvious of all is the example of the 'image.' The text is not reducible to the ensemble of words that constitute it. The image is an element in all narratives. The narrative voice entertains a relationship with the visual fabric that permeates the text, but this is not a systematic relation of mastery.

The narrative voice does not 'create' or produce all the images rendered in the text; many preexist the voice's description of them. 'Voice' is a term invented to eliminate authorship as the prime preoccupation of literary studies, yet to let it in again through the back door. Wayne Booth published a book in 1961 called *The rhetoric of fiction*. As the title indicates, two elements of what constitutes the field or object 'literature' in the common understanding orient it away from the author's primacy: 'rhetoric' and 'fiction.' The one indicates that whoever 'speaks' the words in the text does not speak straightforwardly in a direct, reliable, constative mode of language use, but may be caught in acts of seduction, deviation, figuration, or outright lying. Hence, the second element, 'fiction,' which takes literature away not only from the author but also from the world within and for which she writes. Appealing to a mode of reading still most adequately defined as 'the willing suspension of disbelief,' fiction takes the substance, content, or reality of the literary work out of the hands of the author. The latter can wash her hands of everything that shocks, disturbs, annoys, or dangerously entices the reader. The latter, as the definition has it, is responsible for willingly giving up on the author's epistemic answerability.

Booth's book introduced a term – the 'implied author' – that from that moment on was so widely used that it became a cliché. The term is deceptively straightforward. It suggests that the biographical author has a textual delegate behind which she can hide, a guarantee of discretion and cultural politeness morphed into a methodological *de jure* argument. But the concept *de facto* operated the switch, not really from author to text but from author as speaker of the text to reader who construes an image of that person. The reading, the concept promised, would give all information, relevant and desired, about who 'spoke' the narrative. Any questions beyond who wrote the book were indiscreet and redundant.

Inscribed within the text by a 'hand' she could manipulate at will, the author could be read off the page, and it befell to the reader to compose the image of the author from the data gleaned during the reading.

The 'implied author' offered a bonus that the author as corpse did not, and that became too attractive to turn down. In a quite literal double sense, it **authorized** the interpretation one wished to put forward without taking responsibility for it. The phenomenological edge of the concept wore off. What was left was the authority of the constative statements that speaking of – but simultaneously **for** – the implied author afforded. Judgments based on the idiosyncrasies of individual readings could be presented with the aura of having detected what the author, willy-nilly, 'meant to say.' Meaning thus collapsed into intention, as it had before Booth came along.

Meanwhile, a mere seven years later and in a totally different vein, Roland Barthes had put the author to death, given birth to the reader, and conjured up a phantom author rather comparable to Booth's. The author whose death he hyperbolically declared was the masculinist, individualist bossy one of classical narrative and its obedient theorists. Instead, between the lines of his murderous prose, he proposed a figure without identity or voice, an impersonal 'scriptor.'

Neither Booth, who displaces the author into the realm of interpretation, nor Barthes, who attempts to disembodify the author, eradicates this figure. It appears as if the author cannot be entirely dispensed with. For the moment, it seems preferable to just bracket 'him' and look at the results of these rhetorical moves.

Once the author is bracketed and reemerges on the reader's side of things, the first major problem that this move leaves hanging is the question of 'who speaks' the words on the page if it isn't the actual author. The first step, further away from the now rhetorically built author, was the concept of 'narrator.' This addition was necessary because a single narrative, by definition attributed to a single implied author, can easily have many narrators. Also, a narrative 'in the first person' sometimes speaks with the voice of the younger self, and then with the one of the disabused older fellow who decides to write down the life story.

In search of reliable concepts, yet intent upon conceptualizing agency 'beyond' the author, literary studies reformulated the question of 'who speaks' as the question of 'voice.' The word 'voice' is naturalized, a near-catachresis, to account for the fact that a story doesn't come out of the blue, and that someone is responsible for it. As such, it seems indispensable

to circumscribe the subject of the text. But when we use words like 'responsible,' we enter the domain of the ethical.

Related to this responsibility is yet another aspect of voice – as metaphor of textual subjectivity. This metaphor is also the starting point of a search, of the 'whodunit' kind, the quest for the identity of the unknown criminal. This question indicates that words and images matter, that they 'act,' as speech-act theory teaches us. Where acts are performed, someone is accountable; the entire social and legal system works on that premise. No wonder the disciplines that comprise the humanities also take for granted the importance of that fundamental question.

The question 'Who speaks?' interrogates the nature of the verb 'to speak.' This question implies two questions about meaning. The first concerns the construction of meaning. 'What does this mean?' and 'What does she mean (to say)?' are two different conceptions of meaning that the metaphors of authorship conflate, namely signification – the production and processing of publicly accessible meaning – and intention – that inevitable urge to identify meaning with the mind of the genius-artist who put that meaning out. The former has no bearing on authorship; the latter does. Conflating them, then, begs the question of meaning.

The second question implied in the 'Who' question concerns agency. 'What are the consequences?' is perhaps the best way of phrasing it. This question raises two others: on the one hand, that of the effectivity measurable only in terms of reception, in other words, what does the work 'do' to its readers or viewers?, and on the other hand, the social relevance of the work, that is, 'What does it do to the public domain in which it functions?' These two questions, I hasten to add, must be asked in the positive but also in the negative form. What meanings and critical possibilities are repressed when we use a concept of the 'who?' kind, such as narrative voice? In other words, what is the metaphorical status and import of the analysis structured on the basis of 'voice?' In anticipation of my conclusions, this need to ask the question 'who?' negatively – which is rarely done – makes it impossible to dismiss the personification implied by the question.

Conceptions of the Artistic Text

A second cluster of features imported by the metaphor of voice concerns not the subject of the work but the conception of art that underlies it. The privilege mostly unreflectively accorded to narrative voice easily entails an extreme 'mimeticism,' an assumed and endorsed, albeit disavowed, seamless match between

social relations and literature, a match that is literature and art's very mission to question. The relevance of literary narrative resides, precisely, in its refusal to obey the pressure of realism as *trompe-l'œil*. The question of 'who speaks?' can only escape that *trompe-l'œil* if its other, the question of 'who doesn't speak?', is systematically carried on its back, like a parasite. The question of which character, in what social position, does **not** have access to speech, is, on the one hand, one of voice, but on the other, one that undermines the belief in and obedience to the text as 'account.' As Gayatri Spivak remarked in a brief but forceful analysis of the case of Friday in Defoe's *Robinson Crusoe*, (1975 [1719]) – later revisited by Coetzee's *Foe* (1986) – Friday's tongue has been cut (1999: 186–187). In Coetzee's postmodern version, his tongue has been cut literally, hence, physically. This mutilation can, in and of itself, serve as a theoretical object. It stages an almost naïvely literalizing perspective on Defoe's story in a rewriting that is disabused of realism.

The addictive attachment to realism is rooted in the need to protect the aspect of the metaphor of voice that most badly needs scrutiny, namely authority. Authority is both obliterated and protected – and abducted by a criticism that nevertheless derives its authority from it. As I mentioned above, the presence of authority in humanistic studies allows the authorization of interpretation to be naturalized. The concept of voice, hence of narrator, is part of that authorizing impulse. As a phantom presence, the author continues to lurk in the wings as long as the major analytical concepts partake of the author's anthropomorphic shape. The attribution of intention that this concept of narrator facilitates is a weapon in the service of subordinating the reader. The latter, brainwashed by education to interiorize the taboo on exercising her function of 'second person,' is too easily submissive to the intention that clothes the text as long as it is conceived as the unquestioned product of voice. But, I contend, 'below' or 'behind' the thematic of narratorial sincerity, authenticity, and competence lies an alleged and naturalized unity of cultural memory in which those features are given the status of virtues.

Responsibility, in other words, does not equal authority. Both the scriptor and the reader are responsible for their acts of meaning-making, all the more so because they cannot appeal to and hide behind authority. Nor does subjectivity equal agency; one can exist as a subject and still be deprived of agency. Conversely, agency cannot take advantage of the problematization of unity to disavow responsibility. Here lies the importance of a disbelief that undermines realism. Against the desire for authority that informs

the addiction to mimeticism, and before a different kind of entanglement between reader and work becomes possible, a disentanglement of responsibility is necessary.

Nor can voice claim 'origin,' that other doxic cultural obsession. Origin implies generativity, and that perspective must be kept in its limited place. If words and images 'come from' somewhere, it is from the culture that the work and its readers share, at least partially. They are picked up like graffiti and litter from the roads we walk along throughout our lives. They end up in works of art and literature. Then we hasten to narrow their provenance to the single speaker we call 'voice.' Mikhail Bakhtin insisted long ago on cultural polyphony, and many scholars have followed suit (see **Dialogism, Bakhtinian**). Against this craving for and self-evident alleging of origin, I suggest that voice insists too exclusively on illocution, that aspect of speech – and by extension, of all cultural utterances – that indicates the speaker's intent. In the process, it privileges the speaker, writer, or maker of images. Thus, the concept lends itself to subordinating and easily obscuring perlocution, the utterance's **effect**, and thereby disempowers the listener, reader, or viewer. We need to suspend **time**, in the sense of sequence, as narrative's defining principle, if only because of its obsession with the idea of origin. Together, then, the aspects of voice discussed so far – subjectivity, mimeticism, its grounding in authority, and origin – have in common a tendency to restrict narrative analysis to the inscription of time as foundation of narrativity. This remains important. The concept of 'voice' must remain functional, albeit 'under erasure.' But this temporality is located inside the chronotope that constitutes all narrative works.

Native Speaker

R Singh, Université de Montréal, Montreal, Canada

© 2006 Elsevier Ltd. All rights reserved.

Although the rise of the idea of a (naïve) native speaker can be, as pointed out by Dasgupta (1998), traced as far back as the antiurbanist impulse released by German Romanticism of the 19th century, the use of the expression *native speaker* became prevalent in modern linguistics, particularly since the Chomskyan intervention in linguistics, which in perhaps its least appreciated aspect brings metropolitan linguistics back home to the West after a rather long detour to various peripheries and colonies. Although some would argue that Chomsky's ideal native speaker does not look very different from the native speaker of those who hold a more prescriptivist position, he takes the theoretical view that we are all native speakers of the steady state grammar we develop on the basis of innately specified language capacity.

Scholars concerned with what Chomsky calls E-language are, of course, preoccupied with the question: of which language? This, as Muysken (1998) points out, is not a straightforward matter for the internal language/external language (IL/EL) mapping is more often than not asymmetrical (cf. Hindi and Urdu in South Asia, which arguably represent the same IL, and Patois, Dialect, and Quechua in South America, which presumably manifest different IL's). Nor is the relationship between language competence and language use a straightforward one, for the former seems to crucially depend on the latter, as can be clearly seen in language attrition (cf. Seliger and Vago, 1991). These considerations of asymmetrical mapping and use bring social parameters and sociolinguists into the picture. A further complication is added by the so-called indigenized varieties of some European languages, particularly English (for obvious reasons behind its international spread). The debates regarding the status of these varieties, at least some of which are demonstrably fully rule-governed linguistic systems, have made it increasingly clear that both ownership and multilingualism must be taken into account in providing a more viable characterization of the notion of *native speaker*.

Earlier accounts of the notion of native speaker, such as the ones collected in Paikeday (1985) and Coulmas (1981), try to come to terms with some of the complications summarized above. However, with only a couple of exceptions, they do so with what must be seen as a monolingual/monocultural bias, remarkably clearly spelled out by Crystal (1985) and Quine (1985), and with almost no awareness of

questions thrown up by the existence of varieties such as Indian and Singaporean English. The old monolingualist characterization of the concept of native speaker – as mother tongue or first language – may no longer be sufficient (cf. Pattanayak, 1981 and Harris and McGhee, 1992; among others). Token homage to multilingualism or minor adjustments to such a characterization can't solve the problem, because they tend to take a simplistic view of multilingualism.

The functionally determined distribution of the use of particular languages and the concomitant acquisition and competence in them in multilingual societies makes such accounts inadequate because neither the proficiency nor the competence of a multilingual speaker can be described in simple, additive terms – a bilingual speaker is not a simple, additive union of two monolingual speakers. The existence of indigenized varieties of English (and some other European languages) makes these accounts look even worse. It is one thing to de-emphasize or question the role of introspection in linguistics, as many of the contributors to both Paikeday (1985) and Coulmas (1981) do, but quite another to come to terms with what Coulmas (1981: 1) calls “the common reference point” for all of linguistics. Although the question of the relationship between use and the acquisition and sustenance of competence needs to be researched more thoroughly than it has been, no harm is done if the expression *native speaker* is understood as *native speaker/user*, as no one will deny that to become and to remain a native speaker of a language one must use it.

The question, as Kandiah (1998: 90) puts it, is not whether the native speaker/user exists – Paikeday's dismissal of the concept is much too cavalier – but “what we mean when we say that people know, use and view a language in a manner that allows them to see themselves as and to be recognized and accepted as native speakers/users of it.” “To be recognized as” and “to be accepted as” add the dimension of ownership or proprietorship to an already complex set of parameters that must be taken into account in defining the native speaker/user. In other words, the native speaker/user is not dead, as the title of Paikeday's book suggests, but has simply been somewhat prematurely buried by some. Kandiah (1998) rightly insists that the fact that large numbers of ordinary people consciously or unconsciously assume the notion *native speaker/user* in their interactions guarantees that it captures something real. Although it is instructive to deconstruct certain construals of *native speaker/user*, not much is to be gained by discarding the concept completely.

Even if the assumption that one is naturally proficient in one's mother tongue is rejected, Paikeday's suggestion that we use "proficient user of a specified language" instead of *native speaker/user* is not productive because we need to know how to measure proficiency and who determines the norms against which such measuring will take place.

As the considerations that preoccupy most of the contributors to Paikeday (1985) – for example, mother tongue, the age at which acquisition of the language in question began, and the order of acquisition – are rendered irrelevant by the functionally distributed use of and competence in several languages in multilingual societies' the only way to avoid being sidetracked by them is to attempt a characterization grounded squarely in the reality and psycholinguistics of multilingualism. Singh (1994) offers the sort of characterization I believe is needed: "Grammatically speaking, a native speaker of a language is a person who has relatively stable and consistent grammaticality judgements, which he shares with some other speakers, regarding structures alleged to be from his language." A native speaker/user is, in other words, a speaker/user whose well-formed judgments on utterances said to be from her language are shared by her community. Only a definition of this sort can, it seems, preserve the innocent grain of truth in structuralist and generativist conceptions of the native speaker and acknowledge the considerations Kandiah rightly brings to our attention. It also exposes the oxymoronic nature of labels such as *non-native varieties of X* by making it clear that whereas one can legitimately say that native speakers of Texan English are not native speakers of Heartland Canadian English, one cannot legitimately say that native speakers of Texan English are not native speakers of English (because they do not speak Standard British or Standard Midwestern American English).

Although some of the questions thrown up by the emergence of varieties of English such as Indian and Singapore English are very important for characterizing the notion of a native speaker/user, the debates regarding the status of such varieties unfortunately tend to be almost journalistic. Consider the easily understood matter of lexical innovation and morphology, for example. The preoccupation with pedagogy and an almost complete neglect of grammar in the contemporary sense reduce most discussions of lexical innovation in such varieties to journalistic reports on exotica. It is true that Indian English, for example, has words that are peculiarly its own, but all varieties of English have words that are peculiarly their own. Although the delight of discovering words that are unknown in other, particularly standard, varieties of English is understandable, the

unfortunate conclusions that are drawn from such excursions into exotica are unwarranted and seem to stem from a lack understanding of the morphology of Indian English. It is important to look carefully at the morphologically complex words in Indian English and other such varieties. Morphologically complex innovations result from an interaction between requirements of the material landscape and what grammar permits, and here these varieties do not offer much that is radically different.

The fact that *goonda* 'gangster' or *lathi* 'stick' exist only in Indian English is no more interesting than the fact that *tuque* 'a knitted cap resembling a long stocking' exists only in Canadian English. These would be notable if the peculiarity of the lexicon of Indian English could be attributed to a distinct and peculiar morphology. Such an attribution, however, seems unwarranted. Like the peculiarity of the lexica of all other varieties of English, the peculiarity of Indian English seems limited to simplexes. Hosali (1998) intended her example of *lathi-charge* 'an attack with *lathis*' to show a distinctive morphological pattern in Indian English. She notes that the distinctive feature of this morphologically complex item is "the use of a *lathi* or 'a long heavy stick made of bamboo and bound with iron.'" This explanation shows, contrary to her own suggestion, that the item is not a result of substratum-influenced morphology or of an unlicensed extension of English rules of word formation, but reflects the fact that the simplex *lathi* is a word of Indian English, a fact which is of no particular relevance to the morphology of that language. Other complex words also suggest that no such substratum influence or illegal extension is involved in the morphology of Indian English. There is, as I argue in Singh (2002), little in Indian English morphology that cannot be seen as a natural extension of patterns or rules of word-formation used or exploited in other 'native' varieties of English. Indian English certainly has simple and complex words that don't exist in these other varieties, but each one of those has simple and complex words that don't exist in the other varieties. Morphologically complex words in Indian English are, in other words, fully licensed by word-formation rules of English morphology. *Batch-mate* exists in Indian English because *class-mate* and *room-mate* exist in all varieties of English; *collectorate* exists because *director* exists throughout the English-speaking world.

Comparable illustrations from syntax and phonology are easy to find, but perhaps it is sufficient to point out here that there are no structural features at any level of grammatical description that characterize all non-native varieties of English to the exclusion of all native varieties. Given that most linguists

who have made serious efforts to find such features acknowledge that there aren't any (cf. Trudgill, 1995), we are fully justified in concluding that the dichotomy native variety/non-native variety cannot be structurally or grammatically sustained. And if it indeed cannot be sustained, speakers of at least the varieties that can be shown to have their own norms, such as Indian English and Singapore English, must be classified as native speakers of English by virtue of the fact that they are native speakers of their respective varieties – the fact that they are not native speakers of some other variety is irrelevant. This is, of course, consistent with the definition in Singh (1994). Although we fully recognize the importance of acceptance, recognition, and ownership, the definition itself does not have anything to say directly about them, because, as I have argued extensively, these are clearly politico-economic matters, better discussed and negotiated elsewhere (see Lele, 2005). It is perhaps counter-usage, but, fortunately, no more so than the definitions of *democracy* in English dictionaries, for example, which define it not in terms what it actually is but in terms of what it could potentially be. It can, hopefully, be used to persuade those who insist on using technical expressions somewhat arbitrarily that they should refrain from doing so.

It is at least mildly ironic that whereas the asocial tradition of linguistic or grammatical inquiry sees and characterizes the speakers of the sorts of varieties mentioned above as native speakers of these varieties, the allegedly socially responsible tradition of sociolinguistics is responsible for creating the expression *non-native variety*. The former honors its commitment to treat all viable, rule-governed systems of linguistic communication at par, but the latter seems more than willing to sacrifice the grain of innocence contained in the impulse released more than a century ago. It is the sociolinguist's intervention that adds to the understandable pedagogical dichotomy *native/non-native speaker* the unlicensed dichotomy *native/non-native variety*. Why some native speakers of English want to treat some other native speakers of English as non-native speakers is an important question, the answer to which is to be found in the political economy of the contemporary world, though sociolinguists are welcome to try to answer it. Why some English-speaking sociolinguists also want to do that is perhaps an even more important question, at least for theorizing about language and society. And in what is perhaps the final irony, the only sustainable interpretation of 'non-native variety' may well be the interpretation 'not of the land' or 'still retaining its otherness' – that is why the structuralist argument that Indian English, for example, is just as self-contained a system as RP English, for example, sounds like a threat to speakers of other Indian languages in India.

That it also sounds like a threat to speakers of RP English is easy to explain – such a status is seen as a demand for a share in the cultural and political power wielded by the native speakers of English in the inner circle inhabited by RP English speakers. This interpretation is, at any rate, not the one that the creators of the expression *non-native variety* and the promoters of a demonstrably unwarranted use of *non-native speaker* in scientific discourse have in mind. It is not available to them because the non-nativeness they see in or want to confer on varieties such as Indian English and Singaporean English resides in their view, as they make repeatedly clear, in the Indianness or Singaporeanness of these varieties. It can be invoked only by those who, like Dasgupta (1993), believe that the non-nativeness of these varieties (from an indigenous perspective) resides instead in their Englishness.

Natural Language Interfaces

R W Smith, East Carolina University, Greenville, NC, USA

Communicating More Effectively with Computers

As technology has progressed to the point where computing hardware is at its most affordable, one can readily argue that the limiting factor in the usability of computers is the usability of the interface. At the onset of interactive computing, the ability to manipulate the data and programs resident on a computer was restricted to individuals able to master the very rigid syntax and vocabulary of command line interfaces. Consider the following scenario:

Given a file of data containing test results, calculate the relevant statistics about each person and display and save a table of results in sorted order based on average.

A command line to complete this task might look like the following:

```
stats < data.txt | sort -k 3,3n > results.txt ; lpr
results.txt
```

where *stats* is the program for calculating statistics, *data.txt* is the input file, and *results.txt* will be the output file.

Alternatively, if one wanted to produce some type of graph or bar chart, the sort command would have to be replaced with the name of the appropriate program and another complicated set of flags and arguments (such as *-k 3,3n*) would likely need to be specified to produce the proper behavior.

An advance in interface usability is the now ubiquitous graphical user interface (GUI). The GUI primarily relies on the point-and-click control of a mouse to select files, data in files, and programs. With a GUI,

the sample problem might be handled by completion of the following tasks:

- Select the desired program (*stats*) based on location of its associated icon.
- Select the run action from a hierarchical set of menus.
- Specify the input file *data.txt* in a dialog box.
- Reorder the displayed output by clicking on the appropriate column header once or twice.
- Select the 'save as' action to store the results into *results.txt*.
- Select the print menu action and perhaps click on a few more buttons and options to generate the desired output.

With a GUI, the graph or bar chart would likely require other menu selections within the same program. Although the GUI has made interaction with computers more accessible to a greater number of people, it restricts users to a 'select and use' mode of communication and problem solving, requires users to maintain a specialized cognitive model of selection ('when do I left-click' vs. 'when do I right-click'), and requires users to have special knowledge about the location and organization of menus and icons that may vary from application to application and machine to machine.

Now consider the following alternative – a natural language interface (NLI) that might allow the user to specify the necessary actions for our sample scenario as follows:

"I need stats run for the skills tests. Please sort them by average and display and save them into a file."

No specialized knowledge about communication is required by the user. The specification could just as easily have been provided to a human assistant. A NLI can allow people to use all the communicative power of language they already possess rather than

be forced into an unnatural and limiting mode of communication such as a GUI.

This article provides an overview of the utility of various areas of study in natural language processing (NLP) for constructing effective NLIs to computer applications. After discussing technical challenges in constructing NLIs, this article describes approaches to meeting these challenges and concludes with a discussion of representative NLIs that illustrate past, present, and future trends in NLI research and development.

NLI Complexity and Limitations

NLIs are subject to most if not all of the technical challenges studied by researchers investigating fundamental problems in natural language understanding at both the utterance and discourse level. However, since NLIs are grounded within the specific domain of a computer application, the required breadth of linguistic coverage is not as large as it could be, but usually it is broad enough to lead to potential complications such as the ones discussed next.

Contextual Subtlety of Meaning and Ambiguity

Consider a NLI to an in-car navigational system that helps provide directions to the driver of an automobile. Suppose the user says, “I need to get to the airport quickly.” Suppose also that the driver is somewhere in the vicinity of New York City, where there are three major airports. Without confirmation, the system could begin directing the driver to the wrong airport. An appropriate follow-up response could be, “Which airport, LaGuardia, JFK, or Newark?”

Assuming that the referential ambiguity of *the airport* is resolved, the interpretation of *quickly* is not clear-cut either. Some possible parameters that the navigational application might require in order to produce a proper response include the following:

- Exactly how quick? The possibly quickest route might also have a higher risk for traffic delays.
- The reason for getting there quickly. There is a major difference in going to the airport to catch a flight and going to the airport to pick someone up. In many applications, it is important for the system to understand the underlying user goals.

Now consider a slight variation of the same situation, in which the NLI is to a telephone-based travel assistant and the user is now looking for suggestions that involve public transportation, such as subways, buses, and taxis.

“I want to get to the airport quickly and cheaply.”

Depending on the relative constraints of time and money, various suggestions are possible. The interface must be capable of engaging the user in extended dialog that takes context and domain knowledge into account in order to properly advise the user.

Diversity of Expression

Consider the following paraphrases of “I want to get to the airport quickly”:

What’s a [fast|quick|short] route to the airport?
How do I get to the airport as [fast|quickly] as possible?
Can you tell me a [fast|quick|short] route to the airport?
It would be nice to get to the airport quickly.

All these statements are reasonable within the context of a conversation between two people. Unfortunately, not all of them are likely to be reasonable for a NLI. Due to resource constraints in the development process, designers of NLIs invariably must take steps to constrain the allowed language. Common strategies include the following:

1. Constrain syntax and vocabulary of system responses to the allowed forms of input. Users will tend to adopt the language forms they perceive the system to be using.
2. Structure responses to constrain user input choices. This presumes that users will attempt to be cooperative. Compare the following two choices for the initial system statement for a NLI for a travel assistant:

“What are your travel plans?”
“Tell me your destination city.”

The second response naturally constrains the set of maximally cooperative user responses.

3. Provide feedback that enables users to track the progress of the interaction to ensure that proper understanding is occurring. Consider the following sample:

System: Tell me your destination city
User: Nashville.
System: Your destination is Asheville. Tell me your departure city
User: No, I said Nashville.
System: Correction, your destination is Nashville.
Tell me your departure city.

Without feedback, the system error might not be detected until several statements later. Note that the previous example would occur in a speech-based interface rather than a typing interface. However, a NLI that uses typed text for input

tends to allow a wider range of syntax and vocabulary as well as encourages users to communicate via longer responses. Techniques for handling these issues associated with typed input are discussed later when a description of the Why2-Atlas physics tutor is provided.

To summarize, NLIs enable much greater expressiveness for users than GUIs, but steps must be taken to constrain the level of expressiveness so that the NLI is technically feasible. The next section examines key development principles of NLIs and presents a generic architecture for a NLI that will form the basis of our discussion of actual NLIs.

NLI Design Principles

In this section, some key principles for NLI development are discussed. Examples are drawn from the author's experience in developing a system called the Circuit Fix-It Shop (Smith, 1995).

Principle 1: Acquire data on language use for the application domain. It is absolutely crucial to collect data on language use for the problem domain for which the NLI is being constructed. The most common sources of data are samples of human-human conversation and the use of Wizard-of-Oz (WOZ) simulations of human-computer interaction. In a pure WOZ simulation (Fraser and Gilbert, 1991), the user is led to believe that he or she is interacting with an actual computer system, but in reality a human is processing the user's input and controlling the prototype system responses. WOZ simulations tend to require extra time initially to develop, but they can potentially provide more accurate data on what users may actually attempt with a real NLI.

Principle 2: Develop semantic representations for the meaning of user input that are consistent with the semantic representation used in the application domain. Consider the following two utterances and possible meaning representations:

"The switch is not on."
 assertion (switch, position, on, false).
 "The switch is off."
 assertion (switch, position, off, true).

The utterances have the same meaning but their basic representation looks different. This can be further compounded if we consider 'up' and 'down' to be synonyms for 'on' and 'off' in this domain. A decision must be made about the form of canonical representations and consistently used. This is, of course, easier to achieve when the NLI designer is the same person or group as the application domain designer, but this

is not always the case, especially in nonresearch-oriented NLIs in which the application software is likely to predate the NLI. This problem can become very challenging in an NLI to a database in which many synonyms and paraphrases for entities and relationships may be present in the NLI.

This same principle applies to the natural language generation (NLG) component. This component must be able to take the representations for responses that come from the application program and produce appropriate natural language responses.

Principle 3: Decide early the level of separation to be maintained between language processing components of the NLI and the application's domain reasoning components. Greater reusability is possible if the NLI software is kept completely separate from the application domain software, but it is not always easy to do. The issue becomes particularly complex when choices of meaning representations are made. Consider the following statements about a numeric electronic display called an LED:

1. The LED is displaying a flashing five.
2. The LED is not displaying a flashing five.
3. The LED is displaying only a flashing five.

The simplest way to keep a separation is to have the NLI produce parse trees for the sentence structure and then send them to a hybrid component that produces a meaning representation usable by the domain reasoning component. The complication arises when domain context is needed to get a complete and accurate meaning representation. Suppose for example, the desired LED display is an alternately flashing five and seven. Given that context, the domain-specific meaning for each utterance would be the following

1. The seven may or may not be displaying with the flashing five.
2. The five may be displaying without flashing (or not displaying at all).
3. The specification is reasonably unambiguous.

When system designers are constrained by development time, it is convenient to have the Natural Language Understanding (NLU) component parse the user response using a semantic grammar (Jurafsky and Martin, 2000) that translates the input directly into a domain-usable representation. In such cases, the opportunity for portability and reusability is normally sacrificed. It is important to take this trade-off into consideration early in the development process.

Figure 1 shows a generic architecture for an NLI to some type of functional application (such as a database manager). This diagram is not meant to imply

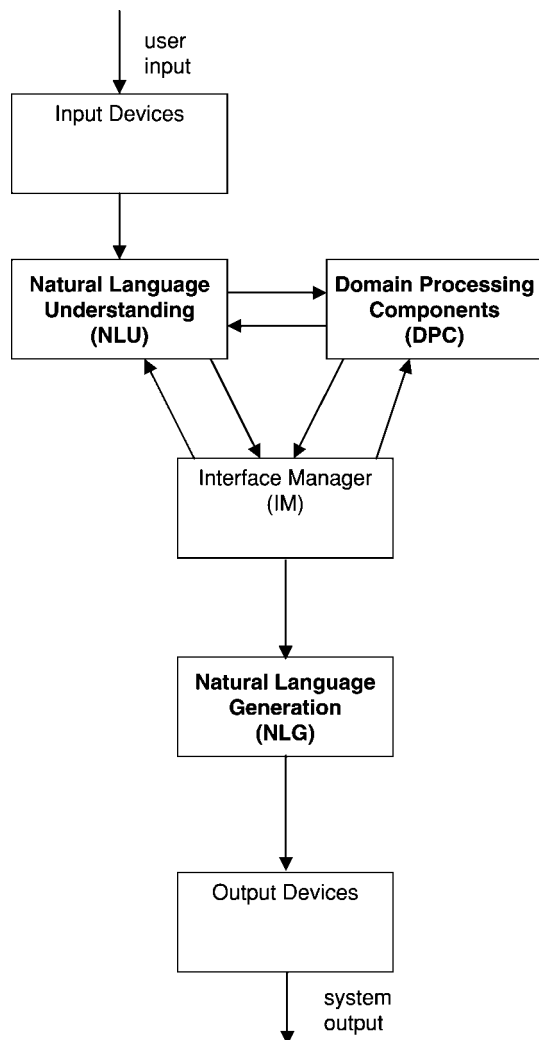

Figure 1 Generic architecture for a natural language interface.

that only one design is possible, but it is meant to describe the primary required components of an interface that will be present in some form in all NLI (sometimes the response component may not use natural language). Users can provide input to the interface through a variety of devices, primarily keyboard and microphone for the NL text/speech, but input may be augmented via devices designed to capture aspects of body language that people also use in face-to-face communication (e.g., gesture and eye gaze).

Once the input signal is acquired, it will be transmitted to the NLU component for analysis. The NLU component may optionally need to interface with domain-specific information in order to complete its task.

In addition, the NLU component may need to communicate with the interaction manager (IM) as part of the understanding process. Generically, we consider

the IM to be all components of the NLI that maintain information about the ongoing interaction. The most common component of the IM would be a dialog manager and associated components designed to track contextual information.

Once the understanding process is complete and a semantic representation of the user input is created, the IM must take the user input and, in conjunction with its knowledge about the interaction and relevant information provided by the domain-processing component (e.g., the content for a response to a user query), formulate a response and send the result to the NLG component. This component will then produce an appropriate response involving NL text and possibly other output forms (e.g., graphical) and transmit the result to output devices such as a monitor, speech synthesizer, or printer.

The following section describes how several application NLIs were designed. How each interface implements the different components in the diagram and handles the key design principles previously described is the focus of the presentation.

Representative NLIs

Text-Based Interfaces

A classic early example of a research system for studying issues in developing NLIs is the Berkeley UNIX Consultant (UC) (Wilensky *et al.*, 1988). The system takes as input typed statements that specify aspects of UNIX about which a user wants to know and produces natural language responses. For instance, suppose a user wishes to remove a directory. Any of the following forms of input would be acceptable:

“I want to delete a directory.”
 “I want to remove a directory.”
 “What’s the best way to delete a directory?”

In all cases the response would be the following:

“use rmdir. For example, to delete the directory named foo, type ‘rmdir foo’.”

The system carries out the NLU process via a two-step mechanism. The first step produces a semantic representation of what is termed the ‘primal content’ of an utterance. This idea is related to the notion of literal meaning, but it can be more abstract than that. For example, in representing the meaning of prepositions, the word *on* can function in various ways (e.g., “The dog is on the chair” vs. “The picture is on the wall”). However, in a primal content representation *on* is considered to have the same usage in both (i.e., it indicates a support relationship).

In the second step, a more domain-specific representation that is termed the ‘actual content’ is produced.

Once the NLU processes are complete, domain processing carries out goal analysis, user modeling, and domain planning. The IM takes the inferred user goals (e.g., learning how to delete a directory) and normally will just specify that the NLG components produce an appropriate answer (e.g., telling the user how to delete a directory), but it can also check to ensure that the user’s goals are not malicious. However, it is not capable of managing extended dialog about a topic. It manages the interaction in terms of user/system response pairs.

An example of a text-based interface that illustrates the advance in core technologies of NLP to create more sophisticated NLI is the Why2-Atlas physics tutor (VanLehn *et al.*, 2002). The system teaches qualitative physics by having students write paragraphs explaining simple mechanical phenomena. The explanations are translated into proofs that are then analyzed for correctness. Here is a sample interaction (transcript courtesy of Pamela Jordan):

System: Suppose a man is in a free-falling elevator and is holding his keys motionless right in front of his face. He then lets go. What will be the position of the keys relative to the man’s face as time passes? Explain.

Student: The keys should remain in a constant relation to the man’s face. Both objects will be in a state of free-fall, and the force of air-resistance should be negligible in an enclosed elevator, so the keys, and the man’s face, which are falling and accelerating at the same speed, should remain in the same relation.

System: You have answered the problem correctly except that what you have in your essay is not a sufficient explanation. Before the release, what is the relationship between the man’s velocity and the keys’ velocity?

Student: equal.

System: Uh huh. If gravity is the only force acting on an object, will it be moving or staying still?

Student: moving.

System: Good. Not only are the person, keys, and elevator moving, they have only gravitational forces acting on them. When an object is falling and has only gravitational force on it, it is said to be in what?

Student: normal force state.

System: Well . . . it’s said to be ‘in freefall.’ Thus, after the release the only force on the keys and man is the downward force of earth’s gravity, so they are in freefall. What force acts on all objects within close proximity to earth?

Student: the gravitational pull of the earth.

System: Yes. Besides the earth’s gravitational force, are there any other forces acting on the person, keys, and elevator after the release?

Student: no, perhaps air resistance on the elevator.

System: Good. Thus, keep in mind that after the release, the only force on the person, keys, and elevator is the force of gravity.

For Why2-Atlas, the NLU is separated into two components, the sentence-level understanding (SLU) component and the discourse-level understanding (DLU) component. The SLU parses each sentence in the student’s response and produces a set of logical propositions to represent the meaning of a sentence. It consists of a lexical preprocessor, parser, repair module, and statistical analyzer. The lexical preprocessor will perform spelling correction and stripping of prefixes and suffixes to produce root forms of words. The parser then does both the syntactic analysis and the construction of the logical form. It handles ungrammatical input through a variety of techniques, including skipping words, inserting missing syntactic categories, and possibly relaxation of grammatical constraints. If an excessive number of analyses is produced, statistical information about word root frequencies and grammatical analyses is used to determine the most likely parse. If the parser cannot produce a complete analysis, its partial results are passed to the repair module. If this module also fails, then statistical approaches are used, including latent semantic analysis (Graesser *et al.*, 2000).

The DLU takes the collection of logical forms produced by the SLU and constructs an explanation in the form of a proof using abductive reasoning (i.e., if $P \Rightarrow Q$, and we know Q , then hypothesize P). After the proof is constructed, the DPC, a tutorial strategist, analyzes the proof to find flaws. Each flaw that is found is associated with a tutorial goal to have the student remedy the flaw in the explanation. The goals are prioritized and sent to the IM, which then sends appropriate specifications to the NLG component for construction of a response. The IM will also insert transitions as each flaw is remedied (e.g., “Good. Not only are the person, keys, and elevator moving, they have only gravitational forces acting on them . . .”).

Recent work with this system involves the use of a speech interface ITSPOKE (Litman and Silliman, 2004) for engaging the student in the follow-up interaction after the initial explanation has been typed, submitted, and analyzed. In general, speech has become a prevalent input device for NLI; consequently, the focus of the remaining NLI to be discussed is on those for which speech is the primary input device.

Speech-Based Interfaces

Robust Language Analysis Depending on the domain, one key factor in the construction of speech-based NLIs that must be handled is that traditional NLU strategies based on the assumption that the input is grammatical are not likely to succeed. This is due to the nature of human speech and the accuracy limitation of speech recognition technology. A system that successfully demonstrates the use of alternative strategies for NLU is the “How May I Help You” system of AT&T (Gorin *et al.*, 2002). The purpose of this system is to allow users to avoid the use of frustrating menu systems for obtaining customer service. A sample interaction is shown in the following dialog excerpt from Gorin *et al.*:

Machine: AT&T. How may I help you?
 User: I have a question about my June bill.
 Machine: Okay, what is your question?
 User: There's a call to Tallahassee, but I don't know anyone there.
 Machine: I can help you with that. Are you calling from your home phone?
 User: I'm calling from my house.
 Machine: Please hold on while I transfer your call.

The idea of the system is to direct user requests more quickly and accurately to the correct service provider. In fact, the authors report greater than 90% success, which represents an improvement on customers' ability to select and navigate through the alternative of hierarchical menus.

Once the word recognition process is complete, the system attempts to find phrases within the user response that are meaningful, where a mathematical measure is used to estimate meaningfulness. Furthermore, information must be used from the IM as the language model changes depending on the state of the dialog. That is, once an initial context has been established (e.g., “I have a question about my June bill”), the next response to the system query will be based on a different language model than the response to “How may I help you?”

Architecturally, this part of NLU is done by the system's speech recognition component, and the NLU component focuses on classifying the type of call the user is making. The IM decides if confirmation and clarification are required as part of the system's response and also decides if additional information is needed in order to properly route the call. It interacts with the DPC that provides a hierarchical description of operator services.

A contrasting approach that is also a commercial phone application is reported in Dybkjær and Dybkjær (2004). Their system responds to frequently asked questions for employees about holiday benefits.

The system combines the use of menus with natural language. (For a discussion of recent design issues for speech interfaces see below).

NLIs That Focus on Dialog Management As technological advances have occurred in NLU and NLG, and speech recognition, although still imperfect, has become usable, many researchers have built NLIs in which the focus has been on enhancing conversational capabilities of systems through the development of more sophisticated IMs (commonly referred to as dialog or discourse managers in specific systems). Two examples of this type of NLI work are the Carnegie Mellon Communicator System (Rudnicky *et al.*, 1999) and the Paco tutorial agent (Rickel *et al.*, 2002).

The Carnegie Mellon Communicator agent is a speech-based NLI that allows users to create travel itineraries that involve multileg airplane trips as well as hotel and car reservations. For speech recognition, NLU, and NLG components, it uses preexisting modules and techniques, sometimes with slight modifications based on domain language modeling. The IM is designed to be domain independent by creating an interpreter that can use a task-dependent script that is provided as part of the DPC. The script provides an overall guide for the structure of the interaction but does not rigidly specify a fixed order for the interaction.

The Paco tutorial agent makes use of the Collagen software system (Rich *et al.*, 2001) for managing extended collaborative interactions. One implemented instructional domain is the operation of a gas turbine engine that propels a ship. An excerpt of a sample interaction from Rickel *et al.* (2002) is given below.

Student: “What next?”
 Paco: (pointing) “Press the on button on engine one.”
 Student: presses the on button on engine one.
 Paco: “Good.”
 Student: “I think I should set the throttle speed.”
 Paco: “Right.”
 Student: “What should the speed be?”
 Paco: “The speed should be stop.”
 Student: sets the throttle speed to stop.
 Paco: “Good.”

Note that in this sample, both linguistic and nonlinguistic inputs are handled by the interface. Collagen's theory of discourse is based on the work of Grosz and Sidner (1986), which includes information about the current focus of attention in the task as well as the mutually believed plans of the dialog participants. Ongoing work uses Collagen to develop NLIs for GUI applications (Sidner, 2004).

There are many other examples of NLIs that make use of sophisticated dialog management that cannot be discussed at length in this article. One particularly

notable interface is the TRIPS system (Allen *et al.*, 2001). This broad body of work includes an emphasis on issues involving speech acts and planning. We now turn our attention to the future of NLIs, a future being driven by technological advances in computer hardware, particularly in regard to alternative communication modalities used by people.

The Future of NLIs: Integration with Other Communication Modalities

We saw with the Collagen-based system, Paco, the ability to handle nonlinguistic inputs as part of the NLI. Another recent development with interfaces is the ability to combine the linguistic and nonlinguistic inputs into a single user communication. This type of input is known as multimodal input and has been shown to improve accuracy in human–computer communication (Oviatt, 2000).

An example of such a system is Smartkom (Wahlster *et al.*, 2001). Smartkom merges ideas about user interfaces from spoken interaction, GUIs, and natural gestural interaction (e.g., touch-screen technology) into a single system. As part of the project, a set of large-scale WOZ experiments were conducted that captured both audio and visual data in order to develop statistical language models based on machine learning techniques. In addition, the system makes use of both NLG techniques and graphical displays for communication with users. Two other representative systems that use multimodal communication are the AdApt system (Gustafson *et al.*, 2000) and the MATCH system (Johnston *et al.*, 2002). These systems demonstrate how NLIs can evolve to be incorporated into more complex interfaces that exploit even more of the means by which humans have been able to communicate with each other – and are now able to use in a limited fashion with computers as well. In general, the future of NLI research and development should see continued efforts in this type of integration work with other modalities. In addition, there should be continued application of more advanced core techniques in NLP, particularly in the area of dialog management, that will increase the range of communicative power by which computer applications can interact with human users.

Neo-Gricean Pragmatics

Y Huang, University of Auckland, Auckland, NZ

© 2006 Elsevier Ltd. All rights reserved.

In 1967, H. P. Grice delivered his Williams James Lectures at Harvard. In these lectures, Grice presented a panorama of his thinking on meaning and communication – what he called his “tottering steps” (Grice, 1989) toward a systematic, philosophically inspired pragmatic theory of language use, which has since come to be known as ‘Gricean pragmatic theory.’ Since its inception, Gricean pragmatics has revolutionized pragmatic theorizing and has to date remained one of the cornerstones of contemporary thinking in linguistic pragmatics and the philosophy of language. This article undertakes to present and assess a neo-Gricean pragmatic theory of conversational implicature, focusing on the bipartite model developed by Laurence Horn and the tripartite model advanced by Stephen Levinson (*see Implicature; Maxims and Flouting*).

The Hornian System

Horn (1984, 1989, 2004) developed a bipartite model. In Horn’s view, all of Grice’s maxims (except the maxim of quality) can be replaced with two fundamental and antithetical principles: the quantity (Q-) and relation (R-) principles.

- (1) Horn’s Q- and R-principles:
 - (a) The Q-principle:
Make your contribution sufficient.
Say as much as you can (given R).
 - (b) The R-principle:
Make your contribution necessary.
Say no more than you must (given Q).

In terms of information structure, the Q-principle is a lower bounding pragmatic principle that may be (and characteristically is) exploited to yield upper bounding conversational implicatures: a speaker, in saying ‘...*p*...’, conversationally implicates that (for all he or she knows) ‘...at most *p*...’ (*see Implicature*). The *locus classicus* here is those

conversational implicatures that arise from a prototype Horn-scale. Prototype Horn-scales are defined in (2) (*see Levinson, 1987, 2000*):

- (2) Prototype Horn-scales:
For $\langle S, W \rangle$ to form a Horn-scale:
 - (a) $A(S)$ entails $A(W)$ for some arbitrary sentence frame A .
 - (b) S and W are equally lexicalized, of the same word class, and from the same register.
 - (c) S and W are ‘about’ the same semantic relation, or from the same semantic field.

An example of Q-implicature is given in (3) (the symbol ‘ $\langle \rangle$ ’ represents ‘Q-scale’; ‘ $\langle + \rangle$ ’ represents ‘conversationally implicates’):

- (3) $\langle \text{all, some} \rangle$
Some of his friends took a taxi to the station.
 $\langle + \rangle$ Not all of his friends took a taxi to the station.

On the other hand, the counterbalancing R-principle is an upper bounding pragmatic law that may be (and systematically is) exploited to engender low-bounding conversational implicatures: a speaker, in saying ‘...*p*...’, conversationally implicates that (for all he or she knows) ‘...more than *p*...’ (Atlas and Levinson, 1981). This is illustrated in (4):

- (4) Have you got a watch?
 $\langle + \rangle$ If you have got a watch and know the time, please tell me what time it is.

Viewing the Q- and R-principles as instantiations of Zipfian economy (Zipf, 1949), Horn explicitly identified the Q-principle (“a hearer-oriented economy for the maximization of informational content”) with Zipf’s ‘auditor’s economy’ (the force of diversification), and identified the R-principle (“a speaker-oriented economy for the minimization of linguistic form”) with Zipf’s ‘speaker’s economy’ (the force of unification). Furthermore, Horn argued that the whole Gricean mechanism for pragmatic inference can be largely derived from the dialectic interaction (in the classical Hegelian sense) between the Q- and R-principles in the following way:

- (5) Horn's division of pragmatic labor: The use of a marked (relatively complex and/or prolix) expression when a corresponding unmarked (simpler, less 'effortful') alternate expression is available tends to be interpreted as conveying a marked message (one that the unmarked alternative would not or could not have conveyed).

In effect, what (5) says is this: the R-principle generally takes precedence until the use of a contrastive linguistic form induces a Q-implicature to signal the nonapplicability of the pertinent R-implicature (for further discussion, see Huang, 1991, 1994, 2000, 2003, 2004a,b, 2005).

The Levinsonian System

Horn's proposal to reduce Grice's maxims to the Q- and R-principles was called into question by Levinson (1987, 1991, 2000). In Levinson's view, Horn failed to draw a distinction between what Levinson called semantic minimization ("semantically general expressions are preferred to semantically specific ones") and expression minimization ("shorter" expressions are preferred to 'longer' ones"). Consequently, inconsistency arises with Horn's use of the Q- and R-principles. For example, in Horn's division of pragmatic labor (see (5)), the Q-principle operates primarily in terms of units of speech production, whereas elsewhere, in Horn-scales (see (2)), for instance, it operates primarily in terms of semantic informativeness.

Considerations along these lines led Levinson to argue for a clear separation between pragmatic principles governing an utterance's surface form and pragmatic principles governing its informational content. He proposed that the original Gricean program (the maxim of quality apart) be reduced to three neo-Gricean pragmatic principles, or what he dubbed the quantity (Q-), informativeness (I-), and manner (M-) principles. Each of the three principles has two sides: a speaker's maxim, which specifies what the principle enjoins the speaker to say, versus a recipient's corollary, which dictates what this allows the addressee to infer:

- (6) Levinson's Q-principle (simplified):
 Speaker's maxim: Do not say less than is required (bearing I in mind).
 Recipient's corollary: What is not said is not the case.

The basic idea of the metalinguistic Q-principle is that the use of an expression (especially a semantically weaker one) in a set of contrastive semantic alternates (such as a Horn-scale) Q-implicates the negation of the interpretation associated with the use of another expression (especially a semantically

stronger one) in the same set. In other words, as already mentioned, the effect of this inference strategy is to give rise to an upper bounding conversational implicature. Seen the other way round, from the absence of an informationally stronger expression, it is inferred that the interpretation associated with the use of that expression does not hold. Hence, the Q-principle is essentially negative in nature.

Three types of Q-implicatures can then be identified: Q-scalar implicatures, Q-clausal implicatures, and Q-alternate implicatures. The Q-scalar implicatures are derived from prototype Horn-scales. They were illustrated in (3) (recall that '+>' represents 'conversationally implicate') and are shown schematically in (7):

- (7) Q-scalar: $\langle x, y \rangle$
 $y +> Q\text{-scalar} \sim x$

Q-clausal implicatures are inferences of epistemic uncertainty (Gazdar, 1979). They are shown schematically in (8) and are exemplified in (9):

- (8) $q\text{-clausal}: \langle x(p), y(p) \rangle$
 $y(p) +> q\text{-clausal } p, \sim p$
 (9) $\langle (\text{since } p, \text{ then } q), (\text{if } p, \text{ then } q) \rangle$
 If you want to sell more, you should reduce your prices.
 +> You may want to sell more, or you may not; perhaps you should reduce your prices, or perhaps you should not.

Q-alternate implicatures come from a nonentailment semantic contrast set (Harnish, 1976; Horn, 1989; Hirschberg, 1991; Levinson, 2000). Roughly, there are two subtypes here. In the first, the expressions in the set are informationally ranked, as in (10). Following Huang (2005), let us call this subtype 'Q-ordered' alternate implicatures. By contrast, in the second subtype, the expressions in the set are of equal semantic strength, as in (11). Let us term this subtype 'Q-unordered' alternate implicatures:

- (10) $\langle \text{marry, engage} \rangle$
 They've engaged.
 +> They haven't got married.
 (11) $\langle \text{dog, cat, hamster, } \Lambda \rangle$
 John has a dog.
 +> He doesn't have a cat, a hamster, and Λ as well.

We come next to Levinson's I-principle:

- (12) Levinson's I-principle (simplified):
 Speaker's maxim: Do not say more than is required (bearing Q in mind).
 Recipient's corollary: What is generally said is stereotypically and specifically exemplified.

Mirroring the effects of the Q-principle, the central tenet of the I-principle is that the use of a semantically general expression I-implicates a semantically specific interpretation. In other words, as already noted, the working of this inferential mechanism is to induce a lower bounding conversational implicature. More accurately, the conversational implicature engendered by the I-principle is one that accords best with the most stereotypical and explanatory expectation, given our real-world knowledge. This is depicted schematically in (12) (the '[]' here is intended to indicate an 'I-scale'):

- (13) I-scale: [x, y]
 $y +>_I x$

The class of I-implicature is heterogeneous, ranging from conjunction buttressing (as in (14)) through negative raising to interpretation of spatial terms, but I-implicatures do share a number of properties, notably: (a) they are more specific than the utterances that engender them, (b) unlike Q-implicatures, they are positive in nature, (c) they are characteristically guided by stereotypical assumptions, (d) they are nonmetalinguistic, in the sense that they make no reference to something that might have been said but was not (*see Metapragmatics*), and (e) unlike Q-implicatures, they normally cannot be canceled by metalinguistic negation (for an attempt to formalize the Q- and I-principles, see Blutner (1998)):

- (14) p and $q +> p$ and then q
 $+> p$ therefore q
 $+> p$ in order to cause q
 John pressed the spring and the drawer opened.
 $+>$ John pressed the spring and then the drawer opened.
 $+>$ John pressed the spring and thereby caused the drawer to open.
 $+>$ John pressed the spring in order to make the drawer open.

We finally turn to Levinson's M-principle:

- (15) Levinson's M-principle:
 Speaker's maxim: Do not use a marked expression without reason.
 Recipient's corollary: What is said in a marked way is not unmarked.

Unlike the Q- and I-principles, which operate primarily in terms of semantic informativeness, the metalinguistic M-principle operates primarily in terms of a set of alternates that contrast in form. The fundamental axiom on which this principle rests is that the use of a marked expression M-implicates the negation of the interpretation associated with the use of an alternative, unmarked expression in the same set. Putting it another way, from the use of a marked linguistic

expression, it can be inferred that the stereotypical interpretation associated with the use of an alternative, unmarked linguistic expression does not obtain. This can be represented schematically as in (16) (the symbol '{ }' indicates an 'M-scale'):

- (16) M-scale : {x, y}
 $y +>_M \sim x$

An example of M-implicatures is given in (17b):

- (17a) Mary went from the bathroom to the bedroom.
 $+>$ in the normal way
 (17b) Mary ceased to be in the bathroom and came to be in the bedroom.
 $+>$ in an unusual way, e.g., in a magic show, Mary had been made to disappear by magic from the bathroom and reappear in the bedroom.

Given the preceding tripartite classification of neo-Gricean pragmatic principles, the question that arises next is how inconsistencies arising from these potentially conflicting inference apparatuses can be dealt with. According to Levinson (1991, 2000), they can be resolved by an ordered set of precedence, which encapsulates in part Horn's division of pragmatic labor, as previously discussed.

- (18) Levinson's resolution schema for the interaction of the Q-, I-, and M-principles:
 (a) Level of genus: $Q > M > I$.
 (b) Level of species: e.g., $Q_{\text{-clausal}} > Q_{\text{-scalar}}$.

This is tantamount to saying that genuine Q-implicatures (whereby $Q_{\text{-clausal}}$ cancels rival $Q_{\text{-scalar}}$) takes precedence over inconsistent I-implicatures, but otherwise I-implicatures take precedence, until the use of a marked linguistic expression triggers a complementary M-implicature, leading to the negation of the applicability of the pertinent I-implicature (for further discussion, see Levinson, 2000; Huang, 1991, 1994, 2000, 2003, 2004a,b, 2005).

Further Neo-Gricean Contributions

Building on the Gricean generalized versus particularized implicatures dichotomy, Levinson (1995, 2000) developed a theory of presumptive meaning. He proposed to add a third level – utterance-type meaning – to the two generally accepted levels of sentence-type meaning and utterance-token meaning. This third layer is the level of generalized, preferred, or default interpretation, which is not dependent on direct computations about speaker intentions, but rather on expectations about how language is characteristically used. Stated thus, a neo-Gricean pragmatic theory

of conversational implicature is essentially a theory of presumptive meaning – pragmatic inference that is generalized, arises by default, and thus is presumed. Furthermore, on a classical Gricean account, the total signification of an utterance is divided into what is said and what is implicated. Simply put, what is said is generally taken to be mapped onto the truth-conditional content of an utterance. What is implicated is then defined in contrast to, and is calculated on the basis of, what is said (and in the case of M-implicatures, together with how what is said, is said). Seen in this light, what is said is supposed to provide the input to what is implicated.

To work out what is said, according to Grice (1989), it is required to (a) resolve reference, (b) fix deixis, and (c) disambiguate expressions. To these requirements, Levinson (2000) added (d) unpacking ellipsis, and (e) narrowing generalities. It turns out, however, that the determination of requirements (a)–(e) involves pragmatic inference of some kind. Put another way, there is ‘pragmatic intrusion’ of some sort, namely, the intrusion of pragmatically inferred content into truth-conditional content, involved in the working out of what is said. The question that arises next is what kind of pragmatic intrusion it is. Roughly, there are two positions. The first is that the pragmatic inference under consideration is of a special kind, which differs from conversational implicature. Within this camp, of particular interest are two lines of argument. According to Sperber and Wilson (1986), the pragmatic inference is an ‘explicature’ (see **Relevance Theory**). Another argument is due to Bach (1994), who proposed a third category of communicative content, intermediate between Grice’s ‘what is said’ and ‘what is implicated.’ Bach dubs the vehicle of such a content ‘implicature,’ since it is implicit in what is said. The second position is represented by Levinson (2000), who argued that these so-called explicatures/implicatures result from the same pragmatic apparatus that engenders what is implicated. Therefore, they are largely the same beast as conversational implicature. Consequently, this gives rise to a problem known as ‘Grice’s circle,’ namely, how what is implicated can be defined in contrast to, and calculated on the basis of, what is said, given that what is said seems both to determine and to be determined by what is implicated (e.g., Huang, 1991). Levinson’s (2000) proposal was to reject the ‘received’ view of the pragmatics–semantics interface, namely, the view that the output of semantics is the input to pragmatics, and even to allow implicatures to play a systematic role in ‘pre’-semantics, i.e., in the derivation of the truth-conditional content of an utterance. These matters will continue to be debated (see **Pragmatics and Semantics; Maxims and Flouting; Principles and Rules**).

In recent years, the classical Gricean theory of conversational implicature has successfully and profitably been generalized to other core areas of linguistics. One such area is formal syntax, and the particular topic of inquiry is anaphora. Levinson (1987, 1991, 2000) and Huang (1991, 1994, 2000, 2004a) developed a (revised) neo-Gricean pragmatic theory of anaphora (see **Deixis and Anaphora: Pragmatic Approaches**). The theory has effected a radical simplification of formal syntax, especially as regards Chomsky’s binding theory (see **Syntax-Pragmatics Interface: Overview; Pragmatics: Optimality Theory**). Finally, a number of neo-Gricean experimental works have appeared, putting various aspects of classical and neo-Gricean pragmatic theory to a test (for further discussion, see Huang, 2003, 2004b).

Newspeak

Newspeak

The word 'Newspeak' was introduced by George Orwell in his novel *Nineteen Eighty-Four*, which was first published in Great Britain in 1949. In that novel, Orwell represents a totalitarian society in which the ruling party is in the process of inventing a new artificial language, Newspeak. According to a definition given in an appendix to the novel, "the purpose of Newspeak was to provide a medium of expression for [a] world-view," and at the same time to "make all other modes of thought impossible."

According to Orwell's fiction, Newspeak is based on the premise that a particular 'reality' can be imposed by imposing a particular language. A number of other details are given in the novel, almost all of which are psychologically and linguistically implausible. There were three classes of Newspeak: a class required in everyday life; a class "deliberately constructed for political purposes"; and a scientific and technical class. The vocabulary of each is supposedly constructed to express only ideologically approved meanings. Thus, some words are removed entirely, new words representing new concepts are introduced, and old words are 'stripped' of unorthodox meanings. Orwell seems to have been aware of the difficulty of preventing speakers from producing new meanings, for he notes that Newspeak also eliminates "the possibility of arriving at them by indirect methods." Thus, the word *free* would have its political and philosophical sense removed and would be restricted

entirely to the sense found in a sentence such as *this field is free from weeds*. Morphological processes and categories are simplified. Nouns and verbs have the same form. Thus, the noun *thought* is replaced by *think*. Semantically connected terms have similar morphology: *cut* is eliminated and replaced by the verb *knife*. Adjectives are formed by regular suffixation of nouns (*speed*, *speedful*), with a only a small set of independent adjectives (*good*, *strong*, *black*, etc.) being retained. Comparative and superlative forms are formed by regular suffixation: *good*–*gooder*–*goodest*; suppletive forms are suppressed. All adverbs are formed by the suffix *-wise*: e.g., *goodwise* replaced *well*. Antonyms are all derived by the prefix *-un*: *good*–*ungood*, *cold*–*uncold*, *person*–*unperson*. Other prefixes are *ante-*, *post-*, *up-*, *down-*, etc., and the intensifiers *plus-* and *doubleplus-*, giving, e.g., *pluscold* and *doubleplusungood*. The tense morphology of verbs is regularized: *think*–*thinked*, *steal*–*stealed*, etc. The number morphology of nouns is also simplified: *mans*, *lives*, etc. The principle behind these changes or tendencies, according to the novel, is ease of pronunciation, but the major principles are evidently agglutination and one-to-one correspondence of meaning and morpheme.

Compounding and abbreviation are supposed to be additional characteristics of Newspeak. For example, *goodthink* replaces *orthodoxy* and has the forms *goodthinked*, *goodthinkful*, *goodthinkwise*, *goodthinker*, *crimethink*. These forms are modified (in the political version of Newspeak) by apocope and 'euphony' principles: *Thinkpol* (Thought Police), *Minitrue* (Ministry of Truth)–*Minitruthful*, *Minipax*–*Minipeaceful*, *Miniluv*–*Minilovely*.

Newspeak meanings are supposed to be unique to the system and intelligible only to its speakers. Thus, *oldthinkers unbellyfeel Ingsoc* had a language-specific and untranslatable meaning, according to Orwell. The Newspeak sentence *all mans are equal* could only mean 'equal in size'. The 'Declaration of the Rights of Man' is untranslatable. Newspeak meanings are also unique in the sense that there is supposedly no ambiguity, polysemy, or connotation: "Every concept that can ever be needed will be expressed in exactly *one* word, with its meaning rigidly defined and all its subsidiary meanings rubbed out." But Newspeak also aims to reduce the number of words in its lexicon and to achieve this end some meanings are simply eliminated. (Orwell, or his novel, does not tell us how.) Thus, the meanings covered by the English words *honour*, *justice*, *morality*, *internationalism*, *democracy*, *science*, and *religion* cease to exist along with the words themselves. They are replaced, we are told, by semantically vague words, such as *crimethink*, *oldthink*, *goodsex*, and *sexcrime*.

The meanings of all lexical items in Newspeak are ideological; many are euphemisms and some terms are supposed to invert the evaluative associations of 'oldthink' terms: *joycamp* (forced-labor camp), *Minipax* (Ministry of War). This principle is followed in the sentences of party propaganda: "Ignorance is Strength," "War is Peace," "Slavery is Freedom." Since the political vocabulary of Newspeak is an elite variety, some words represent the structures of society with cynical literalness, e.g., *prolefeed* (cheap entertainment for the proletariat).

Names of organizations, countries, institutions and the like are abbreviated: *Recdep* (Records Department), *Ficdep* (Fiction Department), *Teledep*

(Tele-programmes Department), *Minitrue*, and *Ingsoc* (English Socialism). Orwell presents these fictional forms as a continuation of the real historical tendency to produce forms such as *Nazi*, *Gestapo*, *Comintern*, and *Agitprop*. According to Orwell, the reason for these forms is not just economy of effort, but the intention to limit and control associations. He also claims that the syllabic structure of Newspeak words (always one or two syllables), together with a regular word-stress pattern, has not only a phonological function (to permit rapid speech), but also a cognitive function: to reduce conscious reflection. The use of such words is termed, non-pejoratively, *duckspeak*.

Orwell's Newspeak is part of a tradition. Utopian fictions often portray idealized languages; *Nineteen Eighty-Four* turns the idea on its head. Speculation about language from the 17th century rationalists to Wittgenstein raised suspicions about natural language and proposed ideal rational systems that would mirror the world directly. Some writers, such as Jonathan Swift, satirized the idea; some writers, such as C. K. Ogden in the 20th century, popularized it. Orwell, appalled by contemporary totalitarianism, gave it a contemporary political twist.

Oracy Education

B Davies, University of Western Sydney,
Bankstown, Australia

© 2006 Elsevier Ltd. All rights reserved.

Spoken communicative competence is of vital importance in the establishment and maintenance of individual identities, in the development of communities of shared interest, in the resolution of conflict between and among individuals or groups, in learning to read (Wells, 2003), and underlying all of these, spoken communicative competence is central to learning to think (Barton *et al.*, 2000; Measures *et al.*, 1997; Mercer *et al.*, 2004; Snyder, 2003; Young, 2000). Communicative competence might thus be thought to be central to oracy education. Bearne *et al.* (2003: 1–2) argue, however, that the interest in communicative competence that began in the 1980s and 1990s has been overtaken by a new interest in technologies of control that do not necessarily engender learning:

In the 1980s and 1990s there were many studies in Australia, the United Kingdom and the United States about classroom interaction. In particular, Douglas Barnes, Jerome Bruner, and Gordon Wells were influential in prompting close attention to the role of language in group interactions. At that time, the idea of learners being encouraged to shape and build meanings for themselves, scaffolded by their teachers, indicated a particular stance toward pedagogy. Since that era, in which rich contributions to educational thinking were made, the term ‘interaction’ has gone underground; recently, however, it has been resurrected to denote a particular view of pedagogy. ‘Interactive teaching’ has currently come to have a new stipulative definition, one that assumes the teacher controls the interaction and that teaching will be organized through whole class arrangements. Rather than describing a dynamic exchange between partners in education, interactive teaching has taken on the flavor of transmissional teaching. Greater attention to talk and learning is welcome but tends to sideline the important interactions between, for example, reader/writer and text, or child and child.

Research on talk in classrooms in the new millennium focuses primarily on three areas:

- ‘behavior management’ – how to prevent students from engaging in ‘inappropriate’ talk, or to get them to speak in ways that fit within the discourses deemed relevant and appropriate for classrooms and for specific disciplines (Sage, 2002);
- special education – what to do with the ones who didn’t learn to talk or to talk properly (Martin and Miller, 2003; Pagliano, 2002); and
- multicultural education – how to teach students whose first language is not the language of the classroom (Heller, 2003; Heller and Martin-Jones, 2001; Kennar, 2003).

The questionable assumption underlying talk only being made relevant in the areas where there are perceived deficits, is that in the normal course of events children will naturally acquire spoken communicative competence in the absence of education in oracy. This is in marked contrast to the ways in which literacy is approached as vital to learning.

The new focus on technologies of control may lead to classrooms becoming places in which the communicative practices between teachers and students restrict rather than facilitate and foster spoken communicative competences. It is a matter of concern that students are not being taught how to engage in reasoned argument and how to constructively challenge established patterns of thought (Grundy, 1997). Students with oral competence are arguably better able to deal with ambiguity, to appreciate multiple perspectives, and to be open to alternative ways of seeing things and doing things (Grainger, 2003).

In the absence of attention to and work on forms of spoken language in the classroom and playground, speaking-as-usual establishes and maintains the power of dominant groups, in terms of class (Edwards, 1997) and also in terms of gender and ethnicity (Alloway and Gilbert, 1997; Alloway *et al.*, 2003; Bjerrum-Nielsen and Davies, 1997; Tannen *et al.*, 1997). And as Bjerrum-Nielsen and Davies (1997) point out, no simple set of guidelines will change these deeply entrenched patterns of speech

through which status and power are established and maintained. The extent to which communicative competences and oral competences are regarded as natural is a problem here, because it makes invisible the central means by which the differences, which perpetuate patterns of advantage and disadvantage, are established and maintained.

Formal assessment of an oral component within first language in the secondary classroom is becoming common. In this assessment students must perform themselves as individual speaking subjects in front of an audience of their peers. Informal talk generally runs alongside classroom talk and is often defined as being at odds with classroom talk. Such talk is rarely made subject to serious pedagogical attention, other than to silence it. Scrimshaw (1997) observes that the unsupervised 'talk' on computers may be leading to the entrenching of discriminatory actions and thoughts.

The relations between formal and informal talk in classrooms are complex. Alloway *et al.* (2003) observe that there is often a small group of dominant, powerful boys who are the noisiest members of their class, such noisy and impromptu oral contributions being seen as inappropriate by teachers in the classroom context. They are "noisy, disruptive and frequently off-task. Typical disruptive activities included hitting, punching, pulling out each other's chairs, walking around the classroom, calling out loudly to the teacher" (Alloway *et al.*, 2003: 356). Even when they thus address the teacher, their oral performances are not constituted as acceptable, and they may serve to intimidate both girls and non-dominant boys. Nondominant boys, for example, may be marginalized and silenced, feeling that they cannot engage confidently in nondominant masculinity in front of such dominant peers (Alloway and Gilbert, 1997; Alloway *et al.*, 2003; Paechter, 2000). These boys who engage in assertive forms of informal speech may profit from the inclusion of oral performance as part of their assessment (Harris, 1998), or they may reject public formal oral performance as 'feminine' (Gilbert and Gilbert, 1998). But even the dominant boys may perform poorly when asked to do formal assessable oral presentations if these are incompatible with their particular skills or their idea of themselves (Alloway and Gilbert, 1997; Alloway *et al.*, 2003).

Forms of speech such as those described above are often interpreted in individualistic terms and made punishable. Green and Dixon (1997) have shown that the mode of spoken interaction taken up by any individual stems from the presuppositions that are inherent in the communicative repertoire of their culture; speaking, interacting and interpreting particular

contexts stem from cultures rather than from individuals. Davies and Kasama (2004), for example, show how preschool children's free play establishes and maintains detailed aspects of Japanese culture, particularly in terms of status hierarchies involving age and gender. Well before written language is accessible by them, children are actively acquiring through spoken language the understandings of status and power that their culture makes available to them. At the same time, Pagliano (1997) shows how inability to speak is often interpreted as lack of knowledge. Through a study of those who are unable to engage in oral discourse, Pagliano shows just how central spoken language and communicative competence are to the formation of identity.

Finally, there is a strong case to be made for the importance of teaching collaborative and exploratory talk (Lyle, 1997; Westgate, 1997), where teachers give up their positioning as the authority and work with students to enable them to clarify their own understandings; of teaching joint reasoning talk (Pontecorvo, 1997), where teachers scaffold the development of students' understandings; and teaching skills for generating shared understandings through ongoing talk (Mercer, 1997; Rojas-Drummond and Mercer, 2004). As Young (2000: 546) says: "Conversation ... mediates collective validity judgements, carries forward social tasks, negotiates meanings, and ... comprises at the same time the constraints on these processes The bringing into existence of new meanings, albeit adaptively valid ones, is a necessary feature of inquiry."

Orality

A Fox, Columbia University, New York, NY, USA

© 2006 Elsevier Ltd. All rights reserved.

Orality, both as a theoretical concept and as an empirical phenomenon, has been central to the development of theory and method in modern linguistic anthropology and sociolinguistics, as well as in sociocultural anthropology and social science more generally. Like the concept of 'culture,' orality is massive in its shaping influence on sociolinguistic (and anthropological)

theory, elusive in its definitional essence, and in its very invocation a metonym for ethical, political, and theoretical controversies that far exceed the scope of the present article to review. Clearly, however, an understanding of 'orality' has significance both for the implied or explicit **historical** imagination of Western social science and its readers and for our understanding of how cultural processes are semiotically mediated in a more synchronic and processual sense.

In a deceptively simple formulation, orality could be defined as a phenomenological quality of a given

cultural ethos or social institution that is dependent on the production of embodied sound as a primary vehicle or channel for discursive mediation. Such a definition only begins to suggest the productivity of a focus on sound as a medium for meaning for theories of discourse and discourse genres, for basic understandings of what language 'is' in relation to nonlanguage, and for a wide-ranging critique of some key models of social action, change, and organization that have dominated modern Western social thought. The importance of sound is suggested by the widely adopted terminological refinement 'orality/aurality,' underscoring the mediation (and embodiment, to which I shall return) of culture in and as sound, a phenomenology of culture that does not reduce to production ('orality') or reception ('aurality') and in which the key theoretical metaphors for cultural processes are 'dialogue' and 'discourse' rather than mechanical, cybernetic, or organic visual images.

Sound, on this account, has generic phenomenological properties (including in its interface with other modalities of semiotic mediation) that specifically contrast with, especially, the visual channel of mediation. This contrast is immediately problematic, suggesting the importance of other axes of contrast discussed below. Indeed, gesture, which is a significant nonsounding and largely visual dimension of all language grammars (and central to some syntactic systems) and of almost all discursive practice, has co-existed happily within theoretical accounts of orality and (with the exception of sign language research) been fundamentally distinguished from literacy, with which it shares the visual channel. This is of course because gesture shares with orality a fundamental inalienability from the context of copresent embodied social interaction, a point I will address below.

The key theoretical opposing term to 'orality' is, canonically, 'literacy,' roughly the porting of language into a fully visual medium dependent on extra-individual technologies of inscription, duplication, circulation, storage, and reception of written texts, and the consequences of that porting for all communicative practices it affects. ('Digitality' has also found its way into the keyword canon of late, suggesting another line of theoretical development now under way.) Whether implied or argued, 'literacy' has been widely understood to be a second-order cultural and social phenomenon (or set of phenomena), arising on the foundation of a more 'natural' human condition of orality under specific historical and social conditions. (It is of course simply true that oral communication historically precedes the development of literacy, and that human beings have evolved biologically to be oral/aural/gestural communicators; however, it is now widely believed that

gestural communication, using the visual channel, is of similar or greater evolutionary antiquity to speech and conferred certain evolutionary advantages in the course of human evolution.) When those specific historical conditions that favor literacy's emergence are theoretically or politically valorized, literacy is seen as a progressive force in human development. When they are the object of critique, the valorized 'naturalness' of orality is often invoked. In both cases, 'orality' is constructed as a more 'primitive' mode of communication and phenomenology of culture, one that partakes of either noble or barbaric qualities attached to the 'primitive' more broadly, and one that either persists in the form of threatened 'survivals' and commodified simulacra, or is an inalienable component of human nature and thus a living social force. A more recent tradition of thought has come to view the entire orality/literacy distinction (along with the idea of the 'primitive') as ideologically diagnostic of (Western) modernity itself, with 'orality' largely a political construction of the 'literate' imagination (a view widely linked with deconstructionist theory).

Most students of orality, like most students of literacy (who are sometimes the same students), have moved in recent decades toward an interest in the **interaction** of these communicative modes and cultural phenomenologies in modern discursive formations. In many ways, the theoretical discourse on literacy has inversely mirrored that dealing with orality. For example, both orality and literacy are now widely understood to have diverse manifestations, both within and across social, cultural, political, contextual, and linguistic boundaries, and there is no doubt that 'oral' and 'literate' communities and genres (a key concept, see below) can and do interact and mutually shape a total discursive universe. It is indeed now common to write (or talk) pluralistically of 'oralities' and 'literacies' and to avoid generalizations about the overdetermined social effects of the predominance of any one technology of discursive mediation. It is, however, an open question whether advances in theoretical specificity and complexity have caused the obsolescence of the 'Great Divide' tradition, either among social scientists or the educated public. Both groups, after all, are deeply enmeshed within ideologies and institutions in which 'literacy' reflexively rationalizes the social privilege of the literate. Nor is it clear that 'Great Divide' theories (which attribute fundamental differences in consciousness, learning processes, and world view to oral and literate cultures) are without merit as a mode of historical explanation and filter for social understanding, for example, when they are applied to the study of the systematic discrimination against 'oracy' in modern educational institutions.

However, for linguistic anthropologists, the usefulness of the 'orality' concept has centered on its phenomenological implications for an account of communication as a culturally, contextually, socially, individually, and linguistically variable range of practices in the modern present. While most linguistic anthropologists do believe they are developing a general description of the semiotic codes of cultural life – that is, a comparative science aimed at developing a general, crossculturally valid historical and processual theory of communication – contemporary research practice is rooted in contextualized descriptions of specific communicative phenomena, with a strong emphasis on metacommunicative practices, expressive performance and poetics, the integration of various communicative channels (such as spoken language, writing, and gesture), textuality and entextualization, and the mechanics of referential practice in discourse.

Ethnography is the privileged medium for this research, though works of general theory also abound (with Peircian semiotic theory and functionalist sociology providing primary models and metalanguages). The privileging of ethnography (and especially an ethnographic practice that has been shaped by critiques of 20th-century anthropology's main current of ethnographic theory and method) has serious implications for the standing of orality even among students of social and communicative life in communities and societies that are broadly and stereotypically 'literate.' Another way in which a privileging of orality has served the sciences of communication has been through the development of interdisciplinary links between linguistic anthropology and, especially, ethnomusicology and performance-centered folkloristics, as well as with other disciplines. Obviously, what unites these perspectives is a concern with the sound channel of cultural mediation as a unified (or at least re-integrated) field of research. Within the disciplines of linguistic science, acoustic and articulatory phonology have enjoyed a renewed privilege in the sociolinguistic study of orality, as has, more recently, a lexical semantics focused on sound symbolism, and research on suprasegmental sound elements of language structure, especially sentence intonation and nonphonemic stress. Relationships between music and language and speech and song have also brought certain kinds of musical analysis into a much more central place in the study of communication in general and language in particular. Another link worth mentioning is to literary disciplines, such as translation, in the context of a general advocacy for indigenous cultural rights, language maintenance, and political discourses.

Research falling under the broad heading of a focus on the phenomenology of sound as a medium for

cultural reproduction has systematically addressed and altered many key theoretical concepts in linguistic anthropological, literary, and musical scholarship. Among the most important of these concepts are 'text' (and related concepts such as 'context' and 'intertextuality'), 'performance' (which has been systematically recovered from its marginalization within cognitive linguistics and is central to orality research as both an alternative to and an instantiation of 'textuality'), 'genre,' 'social power,' and, most fundamentally, our baseline models of 'cultural memory' and 'dynamics.' Literacy appears to effect an epochal transformation of any given culture's 'archive' of knowledge, making possible the rapid accumulation of massive amounts of specialist knowledge that can be transmitted across space and time (and between genres and texts) without being systematically relearned within each generation or local community. On this account, literacy both enables and is enabled by a ramifying division of intellectual and physical labor, and fosters new kinds of institution that create and sustain characteristic regimes of social power (the valuing of intellectual over physical labor, for example, in the emergence of social class systems). Innovation, or the addition of new material to the archive of stored ('written') knowledge, supersedes replication, and cultural innovators are valorized above cultural replicators. Abstraction of general principles from vast collections of facts (now increasingly modeled after the 'hypertextual' archive of the Internet) becomes the focus of education and social evaluation, rather than mastery of a specific and stable set of 'memorized' facts. Orality depends on a different sort of specialization of intellectual labor, favoring a more conservative emphasis on replication of concrete forms, techniques, formulas, and facts, and a fundamental responsibility of discourse specialists to their constituents to be, themselves, archives (and thus curators) of community knowledge (a key argument of performance-centered folkloristics since the 1970s).

Underlying these theoretical emphases is a basic phenomenological premise: oral/aural discourse (with embodied sound and gesture as its media) is fundamentally context bound in space and in time. Orality depends upon a real or simulated 'live' and copresent interaction. Sound emerges and dies away in the instant of communication, gesture in the blink of an eye. Its inscription freezes some essence of meaning, making meaning available in new and unforeseen contexts of use and interpretation. Clearly, written texts must be able to recover or create their own contexts of use, whether these are generic or novel, or literacy would not be the globally ascendant technology of meaning making and storage that it has become. But an account of orality/aurality as a distinctive phenomenology of

culture must be premised on the claim that the meaning of discourse depends on a calibration of shared social experience in the fleeting moment of instantiation, and that some kinds of meaning are greatly enhanced and amplified under these conditions, just as others are diminished or obscured. (It should be pointed out that the technological mediation of sound problematizes this distinction, and has emerged as a major focus of research in ethnomusicology and cultural studies in recent years).

A related formulation might be called the 'naturalization' of sound as a medium, evident in the persistence and continued development of the study of 'sound symbolism' in linguistic anthropology, maintaining a challenge to the privileging of the 'arbitrariness' of the linguistic sign in structuralist linguistic traditions. Another focus of this perspective (strongly shaped by the influence of Mikhail Bakhtin, ironically a theorist primarily of literary discourse) has been 'reported speech' phenomena, and especially 'direct' discourse idioms, in which the discursive and syntactic principles of imitation and preservation of the context of original 'quoted' utterances favor an elaboration of grammatical markers of evaluation and interpretation carried entirely in such suprasegmental dimensions as tone of voice and rate of speech. Bakhtin's work is also influential for its demonstration of the embedding of oral grammar within literate genres of discourse.

In principle, the visual channel is amenable to the same suspension of the privileging of arbitrariness and investigation of naturalizing mimesis bound to a specific interactive context. The temporal ordering of actions in relation to their agents and objects in syntax, for example, is as much a feature of written as of spoken language, and is subject to a significant range of variation between oral and written discourse within and across languages and dialects. Deictic gestures are, of course, highly context dependent, for example, and appear to vary widely across languages in their grammatical integration with other elements of syntax and discursive form. The iconicity of visual signs has been a major topic in sign language research, and has been treated integrally with other grammatical dimensions of oral poetics (with a focus on reference and deixis) by students of oral discourse. It is significant that so much work on gestural grammar and poetics has occurred in conjunction with work on oral discourse, suggesting an orienting distinction not between the sonic channel and the visual channel, but between the context-bound (and 'naturalized') ground of oral/aural discourse and the decontextualizable and 'arbitrary' ground of written/read discourse.

One further way of locating orality as a distinctive research tradition and perspective must be mentioned. If sound is the physical channel of oral/

aural cultural processes, whether in 'primary oral' or 'secondary oral' settings, the body is the instrument or technology for the production and reception of that sound. Anthropological theory, especially under the influence of feminist thought and social phenomenology, has undergone a general and revolutionary 'return' to a privileging of the body in social explanation in recent decades, after a long phase of privileging culture as a mental phenomenon. While reading and writing are certainly embodied processes, they have rarely been studied as such, and embodiment has rarely been viewed as fundamental to the function of literate discourse. The main stream of linguistic science has, certainly since the 1960s, viewed language as primarily a cognitive faculty, somewhat to completely independent of its channel or medium of discursive mediation (though the brain has of course been understood as the embodied locus of that faculty). Linguistic anthropology, however, after a long engagement with cognitivist theory (though not brain science), has increasingly been concerned with discourse as specifically embodied in voice, gesture, and copresent social interaction, with the body seen as the semiotic ground of cultural meaning and experience. In this view, discourse is the embodiment of meaning in social interaction, with the voice as a sign of the social body and a site of a very practical kind of knowledge and consciousness. This has been very productive for the aforementioned engagements between linguistic anthropology and ethnomusicology, especially around the study of song and musical 'speech surrogates,' acoustic iconicity of natural and social worlds, the interaction of phonemic tone, prosodic intonation, and melodic structure and, above all, in the growing attention being paid to the intertwining of speech and song in particular communities and their expressive economies.

Among the most heartening implications of the contemporary research literature in linguistic anthropology and allied disciplines is that orality need not be understood as an overdetermined (or overdetermining) phenomenology of culture. 'Great Divide' views persist, and continue to play an implicit role in shaping the field of anthropological inquiry. But we have also come to see oral discourse as amenable to a sophisticated description using modified concepts developed largely with reference to the grammar, poetics, and social function of literary texts, while we have had our view of literate discourse challenged and altered by what we now understand as the richness, diversity, and orderliness of oral grammar. Earlier fears of the disappearance of orality under a regime of global literacy appear to be unfounded, along with the related fear that primarily oral cultures (or nonliterate individuals) were doomed to be

isolated from the developmental benefits of modernity, or condemned to symbolize a lost golden age of unmediated 'natural' discourse and social experience. We are early in an era during which we will see oral grammars systematically described without literate prejudice, and in which the focus of empirical research will increasingly traverse the 'Great Divide,' co-evolving with modern language ideologies,

discursive regimes, and communicative technologies and practices.

Ordinary Language Philosophy

P Snowden, University College London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

'Ordinary language philosophy' is the name given to some conceptions of philosophy, which emanated, after the Second World War, from J. L. Austin in Oxford and from Wittgenstein in Cambridge, and which championed the importance for philosophy of attention to ordinary language. The name itself, the origin of which is not recorded, has perhaps been more used by opponents of these ideas than their friends and so has, to some extent, become a term of mild abuse.

Language and Philosophy

Language itself has always been of interest to philosophers. Our ability to understand and use language is such an obvious feature of our cognitive capacities that any attempt to describe and explain cognition must consider language. In the early modern period such philosophers as Locke and Berkeley provided theories of the nature of language, trying to account principally for its semantic properties. Their thinking, however, was dominated by a belief in the priority of thought, conducted according to them in a prelinguistic medium of ideas, over language. Language was regarded as a medium for public expression of private thoughts, and its interpretation was viewed as making words public 'signs for' private ideas. For them the problem, which generated considerable disagreement, was whether the seemingly manifest differences between different parts of language, between, say, names and adjectives, required the postulation of different sorts of ideas. This was, of course, a concern about the nature of ordinary language. By the beginning of the 20th century, a more comprehensive philosophical engagement with the nature of language emerged in the writings of Frege, Wittgenstein, and Russell. This engagement was inspired by the emergence of formal

logic, with its semantic categories, and it was not driven by any prior commitment to the priority of thought over language. There was a real concern with a wide range of different constructions in ordinary language. Thus began what became a, perhaps the, central branch of philosophy, the philosophy of language. Of course, this concern with language was a concern with ordinary language, amongst other sorts of language.

Ordinary Language Philosophy

The name 'ordinary language philosophy' does not stand for this general theoretical concern in philosophy with the nature of ordinary language or for any particular theory about ordinary language. Rather, it stands for two linked approaches to, or theories about *philosophy* itself. The approaches shared the conviction that the key to, or at least a necessary condition for, finally solving philosophical problems lies in some sort of detailed attention to ordinary language. This common theme led philosophers at the time to think that there was a single movement, representing a revolutionary approach to philosophy, which held out hope of laying recalcitrant philosophical problems to rest. However, as we shall see, it is an illusion to think there is a common movement here.

The Oxford Version: Austin

The Oxford ordinary language movement was led by, or inspired by, J. L. Austin, who became White's Professor of Moral Philosophy at Oxford in 1956. Austin himself did not publish much during his lifetime, but established his leadership within a group of highly talented philosophers in Oxford, including Grice, Strawson, Urmson, and Warnock, partly due to his seniority, but also to his extraordinary critical intelligence and personality. Austin had a deep interest

in language and wrote about what he called performative utterances, that is utterances such as saying, in the right circumstances, 'I name this ship Victory,' whereby the act of speech itself accomplishes what it ascribes, in this case conferring a name on a ship. He developed a more general theory of the acts we perform by speech in the William James Lectures he gave at Harvard in 1955, published under the title *How to do things with words*. In these he criticizes his earlier views on performatives and then introduces the famous distinction between locutionary, illocutionary, and perlocutionary acts, which are categories for different types of acts we do in or by using language. Austin also presented his own theory of truth. These publications contain Austin's theories of language and of some of its properties.

Austin, however, thought that, in general, the right method when doing philosophy is to "proceed from ordinary language, that is, by examining *what we should say when*, and so why and what we should mean by it" (Austin, 1961: 129). In the most systematic presentation of his views, in his article 'A plea for excuses,' Austin recommended this for three reasons. The first is that philosophers need to ensure their own language is clear; the second is that we need to prize words apart from the world so that we can look at the world without blinkers; finally, ordinary language contains many distinctions and subtleties that have withstood the tests of time and so must represent a subtle and plausible way of thinking about things, particularly things in normal life. Austin added that his view is that ordinary language will be the 'first word' when doing philosophy, though it need not be the 'last word.' He recommended that one should regularly consult a dictionary to get the sense of the categories and words related to a certain area or domain. Austin himself spent considerable effort plotting the distinctions that ordinary language categories embody. For example, what is the difference between a tool and a utensil? What is the difference between doing something willingly and voluntarily? Questions such as these were studied in Austin's famous Saturday morning discussion group in Oxford. It is indeed a reasonable conjecture that one thing that appealed to Austin about pursuing such questions is that they can be answered by cooperation within a group, amongst whom agreement can be reached, in sharp contrast to what has traditionally been the very solitary methods of philosophy with its continual disagreements.

Some Questions about Austin's Approach

There is, surely, no doubt that plotting the incredibly subtle distinctions of ordinary language is of interest

in itself, and it certainly fascinated Austin. The main question that arises, of course, is what is its relation to, or value for, philosophy. The questions of philosophy are characteristically highly general, such questions as 'Is the will free?', and 'Do we know about the external world?' How, then, does a study of the subtle and rather specific categories of ordinary language help with them? The major weakness of Oxford-style ordinary language philosophy is that it is not based on any theory of the nature of philosophical questions that explains and justifies the relevance of a study of ordinary distinctions to it. In fact, it would have been somewhat anathema to the mind set of such ordinary language philosophers to have a general theory of philosophy, but it meant that its relevance remained obscure.

When Austin discussed philosophy head on, as he did in *Sense and sensibilia*, criticising the sense datum approach of Ayer, he noted that philosophers employ expressions in a way which does not fit their ordinary use. For example, he pointed out that the central terms 'direct perception' which often figure in the very formulation of the problem are used in a special way (see Austin, 1962: 14–19). It is a mistake though to take this discrepancy as a basis for criticism of the talk by the philosophers. It merely reveals that the philosopher's use is technical and in need of an explanation. Austin also clearly thought that the categories of philosophers are far more general than those which are of normal employment. But, again, this fact, in itself, does not amount to a criticism of those general categories.

If this assessment of the gap at the core of Austin's approach is correct, it explains why the approach, despite the fascinations of its ordinary language investigations, simply withered in its appeal to those engaged by philosophical questions. A crucial moment was the publication in 1959 of Strawson's *Individuals*, with its self-avowed aim of doing highly general metaphysics.

The Cambridge Version: Wittgenstein

The second attitude to philosophy that was called 'ordinary language philosophy' is that of the later Wittgenstein, during his period after 1929 when he was primarily at Cambridge. The major presentation of the approach is in *Philosophical investigations*, published in 1953 after Wittgenstein's death in 1951. In the evolution of his later philosophy Wittgenstein was, in part, attempting to explain why his earlier, highly abstract and metaphysical philosophy, contained in the *Tractatus*, is wrong. In that earlier work, Wittgenstein attempted to describe the essential nature of contingent propositions, and the states

of affairs that they report, basically by picturing the elements. There are also the tautologies of logic and mathematics. The pronouncements of philosophy itself seem not to belong to either category, and so the contents of the *Tractatus* were themselves inexpressible by its own standards. Philosophy itself was, therefore, a process you went through in order to realize you had to leave it behind. It is, as Wittgenstein put it, like a ladder you climb only to throw away, no longer needing it. In the process, though, something profound is shown, although not said. This is a highly unusual and paradoxical conception of philosophy.

In the later period Wittgenstein rejected his earlier ideas about the essence of saying, holding instead that speech and understanding are parts of human life, which may take many forms (as Wittgenstein might have said, 'We play many language games'), and which have no hidden common essence that a reflective process like philosophy can discern. However, he retained even in the later period an attitude to what philosophy is that is unusual and paradoxical. His theory is that there are what we might call two activities, which go under the name 'philosophy.' There is, first, traditional philosophy, which for Wittgenstein was often taken to be the *Tractatus*, according to which there are supposed to be distinctively philosophical problems, concerned with the essence of things and our knowledge of the world, and theories are proposed as answers to these questions and rationally assessed. According to the later Wittgenstein, traditional philosophy is not actually engaging with real problems. They are, rather, pseudo problems. He suggested that engagement in traditional philosophy always stems from an initial mistake when one speaks, employing the words of ordinary speech, in a way which is not actually in accordance with how the term in question is really used. They start, that is, from linguistic mistakes. Wittgenstein's view is that these mistakes are not random, but stem from properties of the language we employ. For example, the fact that I can say both I have a pain in my foot and I have a bone in my foot may lead us to imagine that pains are special objects located in space in the same way as bones. He said, "A picture held us captive. And we could not get outside it, for it lay in our language and language seemed to repeat it to us inexorably" (Wittgenstein, 1963: sec. 115). Wittgenstein likened being misled to being tricked. "The decisive moment of the conjuring trick has been made, and it was the very one that we thought quite innocent" (Wittgenstein, 1963: sec. 308). This is a schematic characterization of what is, in many ways, itself a schematic conception of traditional philosophy.

What we might call real philosophy should, according to Wittgenstein, consist in doing what is necessary to remove the impulse to engage in pseudo theorizing. As he famously said; "What is your aim on philosophy? – To show the fly the way out of the fly bottle" (Wittgenstein, 1963: sec. 309). How is this to be done? Wittgenstein had a negative and a positive claim to make. The negative theme is that the impulse is not removed by offering a positive and novel theory about anything that philosophers have attempted to theorize about. That would be to engage in pseudo theorizing itself. The task, rather, is to remove the impulse, and it should be viewed as akin to exterminating a disease. "The philosopher's treatment of a question is like the treatment of an illness" (Wittgenstein, 1963: sec. 255). So the real philosopher should produce something like a pill which removes a headache. It is this idea that is meant when Wittgensteinians talk of philosophy as therapy. The positive recommendation is that the pill should be a reminder how language is actually used. "What we do is to bring back words from their metaphysical to their everyday use" (Wittgenstein, 1963: sec. 116). He added that "when I talk of language ... I must speak the language of every day" (Wittgenstein, 1963: sec. 120). Hence, the idea is that proper philosophy consists in reminding those in the grip of traditional philosophy how we ordinarily speak. This, then, is the idea of Wittgensteinian ordinary language philosophy.

Some Questions About Wittgenstein's Approach

Of the many questions that Wittgenstein's later conception of philosophy prompts, I shall restrict myself to two. Does Wittgenstein's own practice actually fit it? It is fair to say that Wittgenstein is, in his later period, primarily a negative thinker, his primary aim being to show what is wrong with standard philosophical ideas about, for example, understanding, following rules, sensations, action, and necessity. However, he did not think that simply reminding people of what they say accomplishes such criticisms. Rather, his practice was to think himself into the views in a highly creative way to the point where it becomes clear that they represent illusions, but where it is also revealed why they might seem attractive. It is therefore highly misleading to summarize Wittgenstein's own practice as reducing to reminders of what ordinary people say. Second, although Wittgenstein officially seems to think that proper philosophy does not propose theories or add to understanding, he clearly advances theories or

semi-theories himself. Thus, he positively links meaning and use (see Wittgenstein 1963: sec. 43), and he is often taken to be arguing for the clearly philosophical proposition that a private language is impossible (see for example, Wittgenstein, 1963: secs. 258–279). It is, therefore, colossally misleading to think that describing Wittgenstein as an ordinary language philosopher captures his real approach to philosophy.

The second question is whether there is any reason to accept Wittgenstein's official account of the nature of philosophy. There is no *a priori* demonstration by Wittgenstein that the massive variety of questions that traditional philosophers have grappled with are all pseudo problems, grounded at some point in a misuse of ordinary language. Indeed, that seems a remarkably implausible thought. To take an example, traditional philosophers often debated what it is to understand a word. Wittgenstein brilliantly criticized the most popular answer, but it does not follow that the question is misconceived and does not merit a theoretical answer. Moreover, Wittgenstein was, as we have seen, moved to indicate his own answer in terms of use and practice. It seems to me, therefore, that we should regard the attitude to philosophy in the later Wittgenstein as simply an ungrounded and independent commitment within his thought, which does not even fit his own practice.

Conclusion

Austin's own theories about language and knowledge and his critical discussions of the philosophy of perception have remained influential, but both the rhetoric about the centrality to philosophy of ordinary language and the practice of attending to it for the reasons that Austin gives have vanished. Wittgenstein's approach to philosophy is still accepted by some people, but for most the real interest of the later Wittgenstein lies in his discussions of such central concepts as understanding, meaning, rule following, privacy of experience, and so on, and not in his extreme attitude to philosophy.

However, the emphasis on attending to ordinary language lead to significant advances in the theory of language. When philosophers recommended studying ordinary language, they usually meant, or at least said, that it was to be done by asking whether we would or would not say a certain thing in a certain circumstance. So determining the verdict of ordinary language meant determining what would be said. The philosophical relevance of this was supposed to consist in its showing that a philosophical theory which affirmed that P is actually true in circumstance C,

would be wrong if we would not say that P in those circumstances. This prompted Grice, who had been part of the circle around Austin, to reflect on the relation between what is true and what we would say. He noted that truth alone is not usually sufficient to lead to speech, but rather, speech is governed by principles, such as 'Be helpful' or 'Be informative.' He explained in terms of this theory how the saying of something can carry an implication that in no way corresponds to what the remark literally entails. For example, if I remark 'The Provost is sober today' my doing so carries the implication that he is normally not sober. Whether Grice's theory is correct is still under discussion, but the contrast between speech and truth, which is damaging to the rhetoric of 'ordinary language philosophy,' has now become conventional wisdom in philosophy. This insight probably emerged when it did because of those tendencies known as 'ordinary language philosophy.'

Organizational Speech

Despite the diversity of their approaches, agendas and objects of scrutiny, several fields of study can be said to be devoted today to the analysis of organizational discourse, that is, the analysis of talk, writing and nonverbal communication in organizational settings. Although sources of disagreement are plentiful (Putnam and Fairhurst, 2001; Fairhurst and Putnam, 2004), scholars interested in this type of inquiry generally agree that the manner people communicate makes a difference in the way organizations come to exist, function and dysfunction. Whether the objective is to describe or denounce what is happening in organizations, studying organizational discourse enables analysts to reveal key organizational phenomena as varied as identity (Phillips and Hardy, 1997), leadership (Fairhurst, 1993, 2001; Fairhurst and Sarr, 1996), negotiation (Hamilton, 1997; Putnam *et al.*, 1991), domination (Deetz, 1992; Mumby, 1987), or control (Yates, 1993; Winsor, 2000).

For the past 10 years, a growing body of literature has, for instance, developed around the topic of organizational communication as(a) genre(s). At the origin of this movement, one can identify an article by Miller (1984), who problematizes genre as a form of social action, that is, as 'a typified rhetorical action' (Miller, 1984: 151) connecting specific ways of doing things with recurrent situations. Typical genres that can be identified in organizational settings are documents such as memos (Yates, 1989), work orders (Winsor, 2000), checklists (Bazerman, 1997), records (Schryer, 1993) but also social events such as meetings or training seminars (Orlikowski and Yates, 1994). As 'typified communicative practices' (Yates and Orlikowski, 1992), these organizational genres are characterized by forms that organizational members, by imitation, tradition or imposition, reproduce when they communicate. By focusing on these patterns, those studies demonstrate how the routinization of situations, practices and objectives, so typical in organizational settings, come from the **iteration** of textual and physical modes of communication. These forms, which always evolve historically (Yates, 1993; Zachry, 2000), not only punctuate the identity game of a given organization, but also participate in the very process of organizing.

Another way to approach organizational discourse, which has been the focal point of a very important body of literature, is to focus on organizational narratives and storytelling. Why narratives? One

explanation is that these discursive forms are not only action-oriented (they speak about events that happen in a given world, whether fictional or real), but also organized and ordered (they articulate these different events in a structured whole). These two qualities make organizational stories especially interesting to scholars interested in organizational values and identities (Meyer, 1995; Czarniawska, 1997), socialization processes (Brown, 1985, 1990; Kreps, 1990), organizing (Browning, 1992; Weick, 1995; Weick and Browning, 1986), ideologies (Mumby, 1987, 1993) or organizational tensions and conflicts (Helmer, 1993). To paraphrase Czarniawska's (1997) book title, all these studies show how organizational members 'narrate the organization' to make sense of their organizational experiences. This type of activity can of course be used strategically to advance a specific way of interpreting what is happening inside or outside the organization (Boje, 1995; Boje *et al.*, 1997). Given that each narrative represents a specific mode of ordering experiences, it constitutes a privileged way to manage meaning (Weick, 1995) and influence the interpretation of events (see especially Robichaud 1998a, 1998b, 2001, 2002, 2003) (*see Narrativity and Voice*).

The study of interactions also constitutes an important center of attention for scholars interested in organizations. Following the interpretive turn in organizational studies (Putnam and Pacanowsky, 1983), more and more analyses are indeed devoted to the way organizational members interact and exchange in organizational settings. For instance, the movement called interaction analysis (McDermott and Roth, 1978) principally focuses on how 'individuals constrain each other's linguistic behavior' (Fairhurst, 2004) and highlights the sequential effects of interactions, so crucial in organizational processes (Fairhurst and Cooren, 2004). For interaction analysts, studying organizational discourse thus consists in identifying patterns of coordinated behaviors, which leads them to conceive of organizations as temporal forms: a bottom-up approach that presents a dynamic view of organizing. This approach involves the classification of turns of talk according to a pre-defined set of codes, which enables analysts to assess the frequency and iterability of specific patterns of verbal exchanges between organizational members (Bakeman and Gottman, 1986; Gottman, 1982). This type of analysis has been especially useful in identifying models of interaction for negotiation and bargaining sequences (Putnam, 1990), decision-making processes (DeSanctis and Poole, 1994), or manager-employee relationships (Fairhurst *et al.*, 1995).

Another dynamic view of organizational processes can also be found in the work of conversation analysts and ethnomethodologists who have devoted some or most of their analyses to the functioning of interactions in organizational and institutional settings (Drew and Heritage, 1992). In this respect, Boden's (1994) book, *The Business of Talk*, certainly constitutes one of the most important contributions to this field of research. Paraphrasing Heritage (1984), Boden contends that, '[w]hen people talk, they are simultaneously and reflexively talking their relationships, organizations, and whole institutions into action or into 'being'' (Boden, 1994: 14). In other words, any organizational phenomenon, whether it is a matter of identity, control, leadership, or even power, has to be incarnated and negotiated in interaction in order to be brought into being. Through a very detailed analysis of the organization of talk-in-interaction, conversation analysts have, for instance, convincingly shown how key conversational phenomena such as openings and closings, turn takings, adjacency pairs, topic shifts, disclaimers or alignments (Fairhurst and Cooren, 2004; see **Conversation Analysis**) can play central roles in processes as diverse as calls for emergency assistance (Whalen and Zimmerman, 1998; Zimmerman, 1992), group discussions (Adkins and Brashers, 1995), or decision-making processes (Boden, 1994).

Finally, and in keeping with the view according to which written, oral and gestural forms of communication participate in the very constitution of organization (Fairhurst and Cooren, 2004; Grant *et al.*, 1998; Keenoy *et al.*, 1997; Mumby and Clair, 1997; Putnam and Cooren, 2004), an effort at synthesis has also been developed around Taylor and Van Every's (2000) work. One of the main critiques addressed to scholars studying the microphenomena of organizational speech is that their study does not always do justice to the translocal dimension of organizations. In other words, most of the analyses in this field of research tend to focus on what happens in organizations, but do not necessarily go as far as to question the **mode of being** of these collective entities. Following an original intuition by John Dewey (1964), Taylor (1993) has, for the past 10 years, set about showing that instead of focusing on the communication in the organization, one should rather concentrate on the organization in the communication (Taylor and Robichaud, 2004).

This new approach to organizational discourse leads us not only to focus on the organizing property of communication (Cooren, 2000), i.e., how speech acts organize, but also on the communicative constitution of organizations (Taylor *et al.*, 1996). According to this view, the mode of being of an organization

articulates itself around two essential modalities of communication: the conversational modality, which corresponds to the local, fluid, and actional dimension of speech, and the textual modality, which relates to its translocal, relatively fixed, and iterable dimension. By analyzing these two modalities of organizational discourse, one can show that the way people communicate, i.e., the conversational form, does make a difference in the way organizations come to exist, but that this existence also depends on what is communicated, the textual forms, which transcends the here and now of interactions. According to Taylor and Van Every (2000), the organization as a form of life lies in this interplay between the relative fixity of texts and the fluidity of conversations.

Participatory Research and Advocacy

J Baugh, Washington University, St. Louis, MO, USA

Linguistic studies that can legitimately be classified as ‘participatory research and advocacy’ typically include face-to-face fieldwork within speech communities resulting in findings that support greater equality and opportunity for members of the corresponding language community (or communities). Concepts of community vary across disciplines; advocacy may often be limited to subsets within a given society or culture, such as members of ethnic or religious minorities, or recent immigrants who are not yet proficient speakers or writers of the local dominant language(s).

Whereas some linguists devote attention to particular regions, others devote primary attention to members of racial groups. Others may choose gender or sexual orientation as the basis of their studies and corresponding public advocacy.

One of the earliest recorded linguistic acts of public advocacy underlies the classical Sapir-Whorf hypothesis that gave rise to the concepts of ‘linguistic relativity’ and ‘linguistic determinism.’ When pondering the relationship between language and thought processes, Sapir and Whorf hypothesized that certain linguistic concepts tended to directly influence human perceptions and thought processes. These formulations varied from language to language, typically resulting in alternative ways of describing (and perceiving) the same object or concept in two or more different languages. Their pioneering efforts grew directly from Whorf’s occupation as an insurance adjuster who worked with Native Americans. Whorf observed that considerable linguistic confusion and ambiguity existed between English and Hopi. He hoped that his linguistic analyses might better serve his employer, a prominent insurance company, resulting in adjustments in policies and practices that would not only be safer for the Hopi, but which might ultimately save his employer money at the same time.

Milestones in social history tend to parallel advances in studies of language in use that have relevance beyond

that of basic research. When president Lyndon Johnson declared war on poverty in the United States, William Labov began his quest for socially based linguistic analyses that revealed differences in reading abilities and the logic of nonstandard English (see Labov, 1972). Labov’s mentor, Uriel Weinreich, used many explicit linguistic illustrations to account for differences in pronunciation that were attributed to Yiddish. In doing so he simultaneously shattered many bigoted stereotypes about Yiddish and its speakers (see Weinreich, 1953).

Labov’s advocacy for speakers of nonstandard English was direct and emphatic on many occasions, particularly when he dispelled linguistic and cognitive myths regarding the inferiority of vernacular Black English, as well as other nonstandard dialects. Wolfram *et al.* (1999) extended educational advocacy to others who spoke nonstandard varieties of American English in overt ways, including educational exhibits and documentary films. Weinreich’s early efforts regarding the linguistic liberation of Jews in the United States were indirect, and ancillary to advances in linguistic science regarding evaluations of languages and dialects in contact. Labov and Wolfram’s independent acts of linguistic advocacy have been intentional and consistent with applied linguistic tradition.

Within the United States, issues of linguistic advocacy became pronounced with the 1974 passage of the National Council of Teachers of English resolution regarding ‘Students’ right to their own language.’ Despite the predominance of English in the United States, delegates of the NCTE “became concerned in the early 1970s about a tendency in U.S. society to categorize nonstandard dialects as corrupt, inferior, or distorted forms of standard English, rather than as distinct linguistic systems, and the prejudicial labeling of students that resulted from this view.”

The NCTE’s concern had been informed by an extensive body of sociolinguistic literature, some of which was directly devoted to language development for educational and professional purposes. Others were devoted to studies outside of educational settings. Works by Abrahams (1985), Fought (2003), Kochman (1981), Rickford and Rickford (2000), Wolfram,

Adger and Christian (1999), Valdés (1996, 2003), Zentella (1997), and others were indicative of linguistic scholars who had served directly or indirectly as advocates for speakers of minority languages or dialects.

England and Australia witnessed different approaches to matters of social and educational advocacy in the works of Bernstein (1971, 1975) and Halliday (1994). Bernstein (1971) was well known for his formulation of the concepts of 'elaborated codes' and 'restricted codes' based on studies in England. Halliday (1994) embraced complex models of language usage that were holistic, seeking to be comprehensive and universally applicable. Research by Cheshire (1982), Giles and Coupland (1991), and Milroy (1987) added alternative models of research that explored second dialect acquisition, social networks and their linguistic consequences, and the impact of linguistic accommodation. Trudgill's (2000) broad, English-based studies provided the foundation for comprehensive surveys of the entire field of sociolinguistics. As is the case in the United States, efforts among linguists throughout the world to serve as social advocates include direct and indirect approaches.

Another dimension of linguistic advocacy is related to sex. Eckert and McConnell-Ginet (2003), Holmes and Meyerhoff (2003), and others analyzed actual and idealized differences in men's and women's language, and the usage of language among women when men are absent. The advocacy dimension that these works share sought to advance greater opportunities and equality for women worldwide. They cut across race, region, class, and education, which are often discussed in isolation of matters pertaining exclusively to women.

Skutnabb-Kangas and Phillipson (1994), Alexander (1989), Gibson (2004) and Mesthrie (1992) sought to address 'human linguistic rights' as a generic subject, or as related to the specific sociolinguistic and political circumstances of specific nations. Complementary studies of linguistic foundations of social strife were developed by Joshua Fishman, growing directly from his pioneering studies of the sociology of language.

Additional linguistic research devoted to public advocacy of various kinds, say, attending to education, women, or uses of language in the workplace, will often have an explicit regional orientation. This survey does not adequately reflect efforts by scholars who study their local linguistic community (or communities) with sensitivity to their immediate sociohistorical circumstances.

Pennycook's (1998) studies of language usage in Australia and elsewhere had relevance to other nations that are post-colonial with populations from diverse backgrounds. Similarly, Bortoni's (1985)

linguistic studies in Brazil drew attention to the special plight of indigenous people in the wake of European colonization and its corresponding educational consequences. Many other studies of indigenous people strove to advance linguistic dignity with greater educational and social opportunities for people who were, or remain, marginalized – if not displaced – in their native homeland. These concerns are strongly evident in societies that are former European colonies, where European languages continue to serve dominant institutional functions while indigenous languages are often subordinate.

Differences in social opportunity become pronounced when viewed in terms of the distribution of various social services that are provided either publicly or privately in nations throughout the world. Linguistic research has also observed differential access to medical treatment or justice based on proficiency, or the lack thereof, of the dominant standard language in a given society.

Medical applications of linguistics also fall within the realm of advocacy research, and Labov and Fanshel's (1977) *Therapeutic discourse*, which was complemented by Ferrarra's (1994) *Therapeutic ways with words*, was illustrative of analyses that employed discourse analyses to the benefit of medical application in general, and therapeutic application quite specifically. Studies of doctor/patient interaction are pervasive, as are studies of language usage in the courts. Policy implications abound from these efforts, because they frequently expose the relative linguistic strengths and weaknesses that exist within a society, particularly if that society seeks to serve populations that do not share a common language or culture.

Preston's (1989) studies of dialect perceptions emphasized another reality; namely, that people tend to judge others' linguistic behavior based on egocentric impressions that are reflective of personal linguistic exposure. Long before Preston discovered this among speakers of English throughout the United States, Lambert (1972) and Tucker and Lambert (1972) demonstrated that bilingual and bidialectal attitudes toward speakers of other languages or dialects are firmly entrenched, and they have real consequences for people who are perceived to be more or less qualified for jobs or educational opportunities based on their speech.

Research by Baugh (2003) and Smalls (2004) explored the consequences of linguistic profiling and other forms of linguistic discrimination in U.S. housing markets, where speakers of minority dialects or languages have been denied access to fair housing or fair lending over the telephone. Whereas the courts in the United States are well equipped to prosecute cases where alleged racial discrimination is based

on face-to-face encounters, Smalls (2004) demonstrated that U.S. courts are less capable of prosecuting cases where discrimination takes place during telephone conversations. Complementary dialectology studies illustrate that stereotypical names associated with particular racial groups within the United States result in different opportunities in the workplace. For example, identical resumes were submitted to prospective employers with only the name of the applicant changed. Jamal is less likely to get a job than is Greg, and Lakisha is less likely to get a job than is Emily; that is, with all other professional and personal attributes being strictly controlled by experimental design.

These more recent studies of linguistic prejudice have direct legal and policy implications that are currently reflected by a body of scholarship devoted to linguistic applications under special circumstances (e.g., with respect to lending practices, helping to overcome linguistic barriers to unequal access to fair housing, or the extent to which voice identification plays a direct role in civil and criminal legal proceedings (see Smalls, 2004)). Building upon studies of linguistic perceptions that were pioneered by Preston (1989), Giles and Powesland (1975), Labov (1972), Wolfram (1991) and others, studies of linguistic profiling began when Purnell, Idsardi, and Baugh (1999) exposed clear patterns of racial discrimination in housing markets based exclusively on telephone conversations. Those findings were replicated and modified by Massey and Lundy (2001), who integrated their innovative linguistic and sociological experiments into course work. Graduate students from different racial backgrounds made systematic telephone calls to prospective landlords, revealing a statistically significant bias against housing opportunities for poor African American women, in greatest contrast to white males who were proficient speakers of Standard American English.

Small's (2004) legal analysis titled 'Linguistic profiling and the law' provided a comprehensive survey of U.S. court cases where African American voice identification played a central role. Her efforts grew directly from observations made regarding a Kentucky Federal District Court that upheld the conviction of an African American defendant, based on the testimony of a white police officer who had never seen the defendant in person, but who had previously heard the alleged voice of the defendant through a wiretap.

In South Africa we find that Alexander's (1989) formulation of an expansive national language policy was a direct political result of efforts to advance racial equality in the new South Africa. Similarly, the extraordinary global event of South Africa's Truth and Reconciliation Commission (TRC) has created an

exceptional corpus of discourse that graphically confirms astonishing acts of inhumane maltreatment. Gibson (2004) went beyond the text of the TRC and accounted for many of the significant social and political circumstances that lay beyond discourse. Who held power, and who did not, influenced many non-verbal or non-linguistic events within the TRC. Speakers needed to compose themselves; others wept openly, while still others seethed with controlled anger. The transcript alone does not fully convey the meaningful exchange of information that was communicated during the TRC.

The scholarly ventures described here, and many others that are supported by scholars throughout the world, continue to use linguistic science in support of advancing greater social opportunities and justice among linguistically heterogeneous people. Within the context of the current global economy, those who support these efforts do so frequently to the benefit of advancing enhanced communication among diverse populations. I believe such efforts are consistent with the enduring quest to advance world peace.

Life

Charles Sanders Peirce (pronounced 'purse') was born on September 10, 1839, in Cambridge, Massachusetts. He was regarded as a child prodigy in science and philosophy. His father, Benjamin Peirce, was a

renowned mathematician at Harvard University who liked to stimulate his son's thinking by presenting intricate and original problems. This unique didactic atmosphere may have been a stimulus for Peirce's development as an original thinker. However, despite a promising youth and a brilliant mind, Peirce never achieved a tenured academic position.

Peirce graduated from Harvard in 1859 and received his bachelor's degree in chemistry from Lawrence Scientific School in 1863. That same year he married his

first wife, Harriet Melusina Fay. For the most part of his life – i.e., from 1859 until the end of 1891 – he was an employee with the U.S. Coast and Geodetic Survey (of which his father was a cofounder), where he performed gravity research and pendulum experiments. His work brought him to Europe on five occasions, each time for a stay of several months. From 1879 until 1884, Peirce held a parallel job at Johns Hopkins University, teaching logic at the department of mathematics. His early resignation is said to be due to his personal problems (he got divorced and later remarried).

After his forced resignation from the U.S. Coast and Geodetic Survey in 1891, Peirce was never again able to obtain a steady job, although he was invited for short-term lecturing posts at various institutions such as Harvard (1865, 1869–70, 1903, 1907) and the Lowell Institute in Boston (1866, 1892, 1903). Most of his writing after 1891 was done for pay. Peirce reviewed and translated books and contributed to several dictionaries and encyclopedias. His articles, in which he worked out his theories, often remained unfinished or were rejected by editors. He also did some consultancy work as a chemist. During the last years of his life, despite inheriting money and some possessions from his mother and aunt, he often had to rely on the financial support of his friends, e.g., William James. Peirce died of cancer in Milford on April 19, 1914.

His Work

Peirce's work covers an astonishingly wide variety of subjects. He wrote on chemistry, physics, religion, perception and categories, epistemology, history of philosophy, philosophy of science, and mathematics (ranging from fundamental theoretical issues to the mathematics of card tricks). Yet he regarded himself first and foremost as a logician. His modifications and extension of Boolean logic and his work on the logic of relatives following De Morgan are still considered to be major paradigm shifts in modern logic. But even more importantly, perhaps, Peirce may be regarded as the founding father of two still very influential traditions, viz. philosophical pragmatism – later further developed by William James and James Dewey – and semiotics (which Peirce himself labeled 'semeiotic').

Categories and Signs

From a very early age Peirce was well acquainted with the works and ideas of Kant, whose *Critique of pure reason* greatly influenced his thought. Peirce disagreed with Kant's categories, however, and developed his own original and coherent set of universal categories that include ideas as well as objects.

Peirce's philosophy distinguishes three universal categories: firstness, secondness, and thirdness. (Peirce always preferred trichotomies over dichotomies in his writings.) The first category refers to a mere quality or feeling, e.g., the quality of red (or the redness of red) such as it is, regardless of anything else. Secondness is the experience of pure reaction, e.g., the experience of red in reality. When a regularity or habit comes in, secondness turns into thirdness. Signs are instances of thirdness par excellence.

A sign consists of a triadic relation between a representamen, an object, and an interpretant, i.e., as a representamen a sign stands for an object with respect to a third, which is an interpretant or a sign in the mind of an interpreter. As every interpretant is again a sign, semiosis or the sign process is infinite, according to Peirce.

Classification of Signs

Another triadic distinction is applied to his classification of signs. In its simplest form, Peirce's classification distinguishes ten classes of signs based on three trichotomies that are themselves derived from his three universal categories. In later work, however, Peirce argued, albeit without offering a satisfying analysis, that there are no less than sixty-six classes based on ten trichotomies.

The first trichotomy is based on the character of the sign itself. *Qualisigns* are qualities (e.g., hardness) which may act as a sign; signs which are actual events or things (such as *a* sign in the previous sentence) are *insigns*, and a regularity (or 'law') that is a sign is termed a *legisign* (e.g., the determiner *a* as a linguistic item).

The second trichotomy is based on the relationship between the sign and its object. An *icon* is a sign that refers to its object merely because of the features it possesses. It is important to note that sheer similarity between sign and object is not what makes a sign an icon; rather, iconicity is based on the fact that the two are interpreted as similar. The second type of sign in relation to the object is called *index*. An index is a sign that is affected by its object, in other words there is a real physical relationship between the two. One popular example is smoke as a sign of fire. Fire produces smoke, so there is a direct (causal) relationship. Finally, a *symbol* is a sign that refers to its object only because there is an interpretant who links the sign to the object, e.g., words and other conventional signs. This second trichotomy is the most interesting (and most widely known) one from a linguistic point of view as it addresses the time-honored topic of the arbitrariness of the linguistic sign and whether there is iconicity involved in language. The linguist R. Jakobson was the first to use Peirce's terminology

to address this topic in his influential article 'Quest for the essence of language' (1966). Since the 1980s a growing number of linguists (mainly in the wake of the work of John Haiman) have argued against arbitrariness in language and in favor of the pervasiveness of iconicity.

The third trichotomy is concerned with how the sign is interpreted and corresponds to the older distinction between term, proposition, and argument. A *rheme* is understood to represent its object merely in its possibilities or features and is neither true nor false. A *dicent sign* or *dicisign* represents its object in respect to actual existence and as such it is either true or false. Finally, an *argument* signifies a 'law' leading from a set of premises to a conclusion.

Pragmatism and Abduction

One of the hallmarks of Peirce's work is his disappointment with the results of philosophy compared with those of the natural sciences. According to Peirce, the success of science is due to its methodology; he argued that philosophy should adopt the same methods, including the use of a well-defined nomenclature. Pragmatism (which Pierce renamed 'pragmaticism' in his later writings) may be regarded as an attempt to establish philosophy as a science, i.e., 'a method of thinking' through which the impact of concepts on man's conduct can be assessed. Thus, pragmatism is ultimately a method to ascertain the true meanings, understood as possible pragmatic values, of concepts. Later pragmatists such as William James and John Dewey extended pragmaticism to other issues as well (e.g., the problem of truth).

Peirce argued that *abduction* is fundamental in scientific as well as everyday reasoning, being the

only type of inference that leads to genuinely new ideas and theories – something that *induction* (i.e., reasoning from some given facts to a general law) and *deduction* (reasoning from a general idea to a particular case) never do. Abduction is the creative process of forming and provisionally accepting an explanatory hypothesis for the purpose of testing it. However, since abduction can only suggest what *may be* the case, it can ultimately never be more than ordinary guesswork.

Phonetics and Pragmatics

W Koyama, Rikkyo University, Tokyo, Japan

© 2006 Elsevier Ltd. All rights reserved.

Linguistic and Semiotic Matrices of Phonetics and Pragmatics

If we define pragmatics as what we do with words, that is, performing acts of referential and nonreferential (social-indexical) signification, involving both (signifying) signs and objects (i.e., what is signified), then phonetics is part of pragmatics, since verbal articulations constitute a kind of action. On the other hand, if we narrowly define pragmatics as

the referential or nonreferential speech acts that result from the use of sounds, mediated by a denotational code called linguistic structure, pragmatics appears located at the signified pole of signification and thus diametrically opposed to phonetics at the signifying pole (*see* **Pragmatics: Overview**). Although the latter definition is usually adopted in linguistics, the former definition is preferred in philosophy, semiotics, and communication studies, which see phonetics and pragmatics as fields dealing with actually occurring indexical acts, events, or their regularities in the extensional universe, as opposed to the intensional, abstract codes of symbolic signs such as make up

linguistic structure (*see Deixis and Anaphora: Pragmatic Approaches*). In this model, pragmatics includes phonetics (i.e., phonetically articulated signs), which, along with graphic, visual, olfactory, and other kinds of signs, may be used to signify some objects, that is, make meaningful significations.

As we shall see later, the linguistic model, which is centered around linguistic structure (i.e., a denotational code presupposingly used in the referential acts of communication), is, as Saussure and Peirce have noted, properly and systematically included in the semiotic matrix, which is concerned with communication as such, including both the referential and social-indexical aspects and both codes and processes (*see Peirce, Charles Sanders*).

The Linguistic Matrix

In the narrower matrix of linguistics, pragmatics and phonetics are polar opposites in terms of methodology and disciplinary organization, partially because linguistics sees language primarily as structurally mediated denotational signification, starting with phonetic sounds and ending with pragmatic referents. Although this is a partial (and, in fact, a somewhat limited) view of communication, inasmuch as it abstracts away the latter's dialectic (interactively processual) and social-indexical aspects, the model is compatible with the total matrix of communication and captures the asymmetric directionality of signification (*see following discussion for details*).

Let us briefly observe the linguistic matrix, focusing on the methodological aspect. Here, one may find a scale consistent with the flow of denotational signification and extending from phonetics to phonology, morphophonology, morphology, syntax, semantics, and pragmatics. On this scale, the positivistic evaluation of facts over interpretations tends to become gradually more dominant as we approach the leftmost pole (i.e., phonetics) and inversely for the hermeneutic evaluation of contextual interpretations regarding bare facts, as it is most prominently seen in pragmatics. Apparently, this configuration suggests that the process of signification moving from sounds to meanings is seen as the transition from physical nature to hermeneutic culture.

Thus, the distinct *modi operandi* of phonetics and pragmatics appear to fit neo-Kantian epistemology, which classifies all kinds of sciences into two methodological ideal types, namely (1) nomothetic natural sciences of *Erklären*, explanation, based on laws and other regularities that can be abstracted from contextualized actions and events; and (2) idiographic, cultural-historic sciences of *Verstehen*, understanding, holistically and hermeneutically dealing

with uniquely contextualized eras, cultures, individuals, or events (cf. Mey, 2001). One may count classical physics and chemistry among the prototypical nomothetic sciences, in contrast to historiography and ethnography as prototypical idiographic sciences; between these two extremes, the soft sciences, including linguistics, are pulled in two directions and thus contain two opposing fields within themselves, to wit: physicalistic phonetics and interpretive pragmatics, with (nomothetic but not physicalistic) structural linguistics in the middle (cf. Koyama, 1999, 2000).

Such is the *de facto* condition of phonetics and pragmatics in our times. Yet, once we take a critical stance to the actual condition, it becomes clear that pragmatics, too, can be construed positivistically, as was done by people like Bloomfield and (later) Carnap, who understood referents as physical things 'out there,' existing independently of any signifying communication; inversely, phonetics may similarly be construed interpretively and idiographically, inasmuch as phones (unlike the abstract regularities called phonemes) are singular happenings in context. Phonetics and pragmatics both concern actual acts (i.e., unique happenings), which may show some regularities; hence, they can be studied idiographically or nomothetically, whereas linguistic structure is an abstract code of denotational regularities, which can be studied only nomothetically. Thus, a critical understanding points to the semiotic matrix of phonetics and pragmatics, to be explicated later.

The Semiotic Matrix of Communication

Pragmatics, Phonetics, and Indexical Semiosis

Communication, as a pragmatic (including phonetic) act or event, is a process of referential or social-indexical signification (i.e., an actual happening that occurs in the extensional universe that may presupposingly index contextual variables) (*see Context, Communicative*). These variables include contextually presupposable intensional codes such as are embodied in the linguistic structure and create certain effects in the extensional universe, such as referential texts, dealing with what is said, and social-indexical texts, dealing with what is done. In this model, as we will see, phonetics becomes a thoroughly pragmatic phenomenon (*see Pragmatic Presupposition*).

The signifying event, whether phonetically executed or not, is a singular happening in the extensional universe and functions indexically, as it points to the context of its occurrence at the *hic et nunc* (*origo*) of the signifying process. Also, the signifying event may present itself as a replica of some objects that appear similar to the event and thus iconically signify

these objects, as in quotative repetition and mirroring reflection. In these ways, the signifying event may signal a number of presupposable objects, which may be types (regularities) or individual objects, and such objects may become signs signifying other objects (*see* Peirce, Charles Sanders). Thus, the signifying event iconically signals or presupposingly indexes regularities and individuals in the context of its occurrence (i.e., it contextualizes them) and creates (i.e., entextualizes) some effects: the aforementioned referential and social-indexical texts (what is said and what is done), the latter primarily concerning the group identities and power relations of discourse participants and other social beings (*see Identity and Language; Power and Pragmatics*).

The preceding is a general picture of signification, as it obtains across the two dimensions of (a) reference and predication, and (b) social indexicality. Note that the objects that are contextualized (i.e., presupposingly indexed) in signifying events may be of various types: *viz.* (1) individual particulars found in the microsocial surrounds of the signifying event, including cooccurring signs (sounds, gestures, etc.), the discourse participants, and what has been already said and done (i.e., referential and social-indexical texts that have been entextualized and become presupposable at the time of the signifying event); (2) microsocial regularities of referential indexicality (e.g., the usage of deictic expressions) and social indexicality (e.g., addressee honorifics, turn taking, adjacency pairs, activity types, frames, scripts, pragmatic principles, maxims, norms) (*see Conversation Analysis*; and (3) macrosocial regularities of referential indexicality (e.g., the causal chain of reference) (Putnam, 1975: 215–271). The latter are involved in the use of proper names (*viz.*, as macrosocially mediated references to individuals that are not found in the microsocial context) and in usage-related social indexicality (e.g., speech genres and socio- and dialectal varieties, characterized by such macrosociological variables as regionality, ethnicity, class, status, gender, occupation, or age) (*see Genre and Genre Analysis; Maxims and Flouting; Politeness; Pragmatics: Overview*). Importantly, these three kinds of presupposingly indexed objects are often phonetically signaled; also, they are all pragmatic in character, as they belong to the extensional universe of actions (vs. the intensional universe of concepts). Indeed, any actions, including body moves and phonetic gestures such as involving (non-phonological) intonation, pitch, stress, tempo, vowel lengthening, breathing, nasalization, laughter, belching, clearing one's throat, snoring, sneezing, going tut-tut, stuttering, response crying, or even pauses

and silence, may be contextualized in the speech event so as to create some particular social-indexical (interactional) effects or to become presupposable regularities that may be expected to occur in certain contexts of particular speech communities (cf. Goffman, 1981; Gumperz, 1982; Tannen & Saville-Troike, 1985; Duranti & Goodwin, 1992; Mey, 2001 for details) (*see Gestures, Pragmatic Aspects; Silence*).

Linguistic Structure and Other Symbols in Indexical Semiosis

A fourth kind of object may be contextually presupposed, namely, the macrosocial regularities constituting symbolic codes. Recall that icons and indexicals signify objects on the empirically motivated basis of contextual similarity and contiguity, respectively. There are, however, numerous attested instances of signification that cannot be totally accounted for by these empirical principles. In such cases, discourse participants appear to indexically presuppose the intensional kind of signs that, without any observable empirical motivation, regularly signify extensional objects. Such signs, called symbols, constitute the system of concepts (cultural stereotypes) and the denotational code called linguistic structure. The linguistic system is thus made up of the intensional signs that are presupposingly indexed in the speech event and symbolically denote extensional entities. Therefore, these intensional systems of symbols are indexically anchored on the extensional universe. This linguistic structure, at the center of which we find the maximally symbolic lexicon, that is, arbitrary (in the Saussurean sense) combinations of morphophonemes and morphosyntactic forms, is organized by the systematic interlocking of symbolic arbitrariness (language-particular structural constraints) and indexical motivation (extensionally based constraints). Of these two, the latter gradually increases as we move from (more abstract) morphophonemes to (more concrete) phonemes and to allophones and other surface phonetic phenomena such as phonotactic filters (*see Pragmatics: Optimality Theory*), and as we move from (formal) morphosyntax to (denotational) semantics and to (referential) pragmatics (*see Pragmatics and Semantics*). Further, just as the markedness hierarchy of distinctive features such as [syllabic] (i.e., [vocalic]), [sonorant], [voiced], which is anchored on and characterized by phonetic extensions (degrees of sonority), can be formulated to describe the differences among (morpho)phonemes and their correspondences, the markedness hierarchy of grammatical categories such as [pronoun], [proper noun], [concrete noun], which is anchored on and

characterized by pragmatic extensions (degrees of the contextual presupposability of referents), can be formulated to describe the differences among morphosyntactic and semantic categories (see the Jakobsonian literature: e.g., Lee, 1997; Koyama, 1999, 2000, 2001 for details) (see **Jakobson, Roman**).

Dialectics of Signs: Interactions of Structure and Discourse

Similarly, at the interface of the intensional and extensional universes, just as semantic categories (e.g., [animate]) may have contextually variable extensions such as [animal] (inclusive use), [nonhuman animal] (exclusive use), as well as particular contextual referents, phonemes may have various allophones, which are contextualized happenings distinct from one another. These phonetic variants and other varying surface expressions, such as allomorphs (e.g., 'matrixes' vs. 'matrices') and syntactic variants (e.g., "It's me" vs. "It's I") appear denotationally identical; in addition, they may clearly show statistically different patterns of cooccurrence with some social categories (e.g., of class, gender, ethnicity), as the variable of 'denotation' is naturally controlled in this environment (see **Class Language; Gender and Language**). As a consequence, the variations in surface forms get distinctly associated with the variations in social categories (cf. Lucy, 1992; also see the journal *Language Variation and Change*). Under such circumstances, language users may essentialize such merely statistical (probabilistic) correspondence patterns by perceiving them as categorical and thus ascribing particular sociological categories to particular linguistic forms. The latter thereby become sociolinguistic stereotypes (Labov, 1972) or registers (made up of lexicalized stereotypes), that is, symbols having the illocutionary forces of social-indexical character (e.g., masculinity, honorificity) in themselves, independent of the actual contexts of their use (see **Register: Overview**). The decontextualizing process also underlies the formation of diminutives, augmentatives, and performative formulae (e.g., "I baptize thee"), which may be used as formulaic one-liners to create rather strong effects in discourse (cf. Lucy, 1993; Hinton *et al.*, 1994; Schieffelin *et al.*, 1998; Koyama, 2001) (see **Speech Acts; Pragmatic Acts**). This illustrates the general process in which the quotative use of a symbol achieves the effect of iconically presenting itself as a replica (token) of the symbolic pattern (type), imposing the presupposable pattern on discursive interaction, and thus creating a text that is more or less bracketed from its contextual surrounds and possesses the social-indexical meanings commonly ascribed to the symbol. More generally, the enunciative, phonetico-pragmatic

act of repetition (cf. the Jakobsonian 'poetic function') saliently serves to create textuality, as witnessed by the poetic use of rhymes; the religious, political, commercial use of chants, slogans, and divinations; the quotidian use of turns, adjacency pairs, and other everyday conversational routines; and any other metapragmatic framings of discourse (cf. Tannen, 1989, 1993; Koyama, 1997; Silverstein, 1998) (see **Discourse Markers; Metapragmatics**).

Conclusion

Being abundantly demonstrated in the literature, the facts referred to in the preceding discussion unmistakably show that phonetics is a semiotically integrated part of pragmatics; it is what we do in the social context in which we live by creating referential and social-indexical texts through the iconic or presupposing indexing of contextual particulars and regularities (types), of which the latter are systematically anchored on phonetic and other pragmatic (i.e., contextual) extensions, thus forming the basis of the relationship between phonetics and pragmatics.

Politeness

B Pizziconi, University of London, SOAS, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Despite several decades of sustained scholarly interest in the field of politeness studies, a consensual definition of the meaning of the term 'politeness,' as well as a consensus on the very nature of the phenomenon, are still top issues in the current research agenda.

In ordinary, daily contexts of use, members of speech communities possess clear metalinguistic beliefs about, and are capable of, immediate and intuitive assessments of what constitutes polite versus rude, tactful versus offensive behavior. Politeness in this sense is equivalent to a normative notion of appropriateness. Such commonsense notions of politeness are traceable as products of historical developments and hence are socioculturally specific.

Scholarly definitions of the term, by contrast, have been predicated for several decades on a more or less tacit attempt to extrapolate a theoretical, abstract notion of politeness, capable of transcending lay conceptualizations and being cross-culturally valid. The theoretical constructs proposed, however, have proven unsatisfactory as heuristic instruments for the analysis of empirical data. Much of the current scholarly debate is focused on taking stock of recent critiques of past dominating paradigms and epistemological premises, and on formulating new philosophical and methodological practices based on a radical reconceptualization of the notion of politeness. The point of contention is the very possibility of survival of any useful notion of politeness, when the construct is removed from a historically determined, socioculturally specific, and interactionally negotiated conceptualization of the term.

Constructs of Politeness

The 'Social Norm View'

Politeness has been an object of intellectual inquiry quite early on in both Eastern (Lewin, 1967; Coulmas, 1992, for Japanese; Gu, 1990, for Chinese) and Western contexts (Held, 1992). In both traditions, which loosely can be defined as pre-pragmatic, observers tend to draw direct, deterministic links between linguistic realizations of politeness and the essential character of an individual, a nation, a people, or its language. Thus, the use of polite language is taken as the hallmark of the good-mannered or civil courtier in the Italian conduct writers of the 16th century (Watts, 2003: 34), or as a symbol of the qualities of modesty and respect enshrined in the Japanese language in pre-World War II nationalistic Japan.

Linguistic realizations of politeness are inextricably linked to the respective culture-bound ideologies of use; accounts, which often are codified in etiquette manuals providing exegeses of the relevant social norms, display a great deal of historical relativity.

Pragmatic Approaches

Pragmatic approaches to the study of politeness begin to appear in the mid-1970s. Robin Lakoff (1973) provided pioneering work by linking Politeness (with its three rules: 'don't impose'; 'give options'; 'make the other person feel good, be friendly') to Grice's Cooperative Principle to explain why speakers do not always conform to maxims such as Clarity (1973: 297) (see Grice, Herbert Paul; Cooperative Principle; Maxims and Flouting). In a similar vein, but wider scope, Leech's (1983) model postulates that deviations from the Gricean conversational maxims are motivated by interactional goals, and posits a parallel Politeness Principle, articulated in a number

of maxims such as Tact, Generosity, Approbation, Modesty, Agreement, and Sympathy. He also envisages a number of scales: cost-benefit, authority and social distance, optionality, and indirectness, along which degrees of politeness can be measured. Different situations demand different levels of politeness because certain immediate illocutionary goals can compete with (e.g., in ordering), coincide with (e.g., in offering), conflict with (e.g., in threatening), or be indifferent to (e.g., in asserting), the long-term social goals of maintaining comity and avoiding friction. This so-called conversational maxim view of politeness (Fraser, 1990) is concerned uniquely with scientific analyses of politeness as a general linguistic and pragmatic principle of communication, aimed at the maintenance of smooth social relations and the avoidance of conflict, but not as a locally determined system of social values (Eelen, 2001: 49, 53) (see **Communicative Principle and Communication**).

Another model, proposed by Brown and Levinson in 1978, *de facto* set the research agenda for the following quarter of a century (the study was republished in its entirety as a monograph with the addition of a critical introduction in 1987).

Like Lakoff and Leech, Brown and Levinson (1987) accept the Gricean framework, but they note a qualitative distinction between the Cooperative Principle and the politeness principles: while the former is presumed by speakers to be at work all the time, politeness needs to be ostensibly communicated (*ibid.*: 5).

Brown and Levinson see politeness as a rational and rule-governed aspect of communication, a principled reason for deviation from efficiency (*ibid.*: 5) and aimed predominantly at maintaining social cohesion via the maintenance of individuals' public *face* (a construct inspired by Erving Goffman's notion of 'face,' but with crucial, and for some, fatal differences: see Bargiela-Chiappini, 2003, Watts, 2003) (see **Face; Goffman, Erving**). Brown and Levinson's 'face' is construed as a double want: a want of freedom of action and freedom from impositions (this is called 'negative' face), and a want of approval and appreciation (a 'positive' face). Social interaction is seen as involving an inherent degree of threat to one's own and others' face (for example, an order may impinge on the addressee's freedom of action; an apology, by virtue of its subsuming an admission of guilt, may impinge on the speaker's want to be appreciated). However, such *face threatening acts* (FTA) can be avoided, or redressed by means of polite (verbal) *strategies*, pitched at the level needed to match the seriousness of an FTA x , calculated according to a simple formula:

$$W_x = P(H, S) + D(S, H) + R_x$$

where the Weight of a threat x is a function of the Power of Hearers over Speakers, as well as of the social Distance between Speakers and Hearers, combined with an estimation of the Ranking (of the seriousness) of a specific act x in a specific culture (see **Face**).

Brown and Levinson compared data from three unrelated languages (English, Tamil, and Tzeltal) to show that very similar principles, in fact universal principles, are at work in superficially dissimilar realizations. The means-end reasoning that governs the choice of polite strategies, and the need to redress face threats, are supposed to be universal. The abstract notion of positive and negative aspects of face (although the content of face is held to be subject to cultural variation) is also considered to be a universal want.

The comprehensiveness of the model – in addition to being the only production model of politeness to date – captured the interest of researchers in very disparate fields and working on very different languages and cultures. One could even say that the Brown and Levinsonian discourse on politeness practically 'colonized' the field (domains covered include cross-cultural comparison of speech acts, social psychology, discourse and conversation analysis, gender studies, family, courtroom, business and classroom discourse, and so on: see Dufon *et al.*, 1994, for an extensive bibliography; Eelen, 2001: 23 ff.; Watts, 2003). Interestingly, a paper by Janney and Arndt made the point, in 1993, that despite considerable criticism of the then still dominant paradigm, the very fundamental issue of whether the universality assumption could be of use in comparative cross-cultural research went by and large unquestioned (1993: 15).

The most conspicuous criticism – paradoxically, for a model aspiring to pancultural validity – was perhaps the charge of ethnocentrism: the individualistic and agentivistic conception of Brown and Levinson's 'model person' did not seem to fit 'collectivistic' patterns of social organization, whereas their notion of 'face' seemed to serve an atomistic rather than interrelated notion of self (Wierzbicka, 1985; Gu, 1990; Nyowe, 1992; Werkhofer, 1992; de Kadt, 1992; Sifianou, 1992; Mao, 1994). Going one step further, some criticized Brown and Levinson's emphasis on the 'calculable' aspects of expressive choice (and the idea that individuals can manipulate these 'volitionally'), to the expense of the socially constrained or conventionalized indexing of politeness in some linguacultures (especially, though not exclusively, those with rich honorific repertoires; Hill *et al.*, 1986; Matsumoto, 1988, 1989; Ide, 1989; Janney and Arndt, 1993) (see **Intercultural Pragmatics and Communication**).

The Gricean framework implicitly or explicitly adopted in many politeness studies has been criticized for arbitrarily presupposing the universal validity of the maxims, and for a relatively static account of inferential processes. In particular, Sperber and Wilson's (1995) Relevance Theory recently has been adopted by politeness theorists as a way to compensate for this lack of interpretative dynamism (Jary, 1998a, 1998b; Escandell-Vidal, 1998; Watts, 2003: 201) (see **Relevance Theory**) and the conversational maxims have been reinterpreted as 'sociopragmatic interactional principles' (Spencer-Oatey, 2003) (see **Maxims and Flouting**).

Others have lamented Brown and Levinson's exclusive focus on the speaker, as well as their reliance on decontextualized utterances and speech acts (Hymes, 1986: 78), choices that similarly detract from a discursive and interactional understanding of communicative processes (see **Speech Acts**).

Social Constructivist Approaches

Hymes (1986) pointed out quite early on that although Brown and Levinson's model was impressive as an illustration of the universality of politeness *devices*, any useful and accurate account of politeness *norms* would need to "place more importance on historically derived social institutions and cultural orientations" (p. 78).

The scientific extrapolation of an abstract, universal concept of politeness was similarly questioned by Watts *et al.* (1992), who drew attention to the serious epistemological consequences of a terminological problem. According to these authors, the field had been too casual in overlooking the difference between mutually incommensurable constructs of politeness: a first-order politeness (politeness₁) derived from folk and commonsense notions, and a second-order politeness (politeness₂), a technical notion for use in scientific discourse. Although the latter (echoing the Vygotskian characterization of spontaneous versus scientific concepts; see **Vygotskij, Lev Semenovich**) can be thought to emerge from an initial verbal definition, the former emerges from action and social practice (Eelen, 2001: 33). As social practice, politeness₁ is rooted in everyday interaction and socialization processes: it is expressed in instances of speech (*expressive* politeness), it is invoked in judgments of interactional behavior as polite or impolite behavior (*classificatory* politeness), and is talked about (*metapragmatic* politeness) (ibid.: 35) (see **Metapragmatics**).

Eelen (2001)'s watershed critique of politeness theories articulates this point in great detail and thus opens up promising new avenues of thought for researchers. The lack of distinction between

politeness₁ and politeness₂ represents a serious ontological and epistemological fallacy of all previous politeness research, as it has determined the more or less implicit 'reification' of participants' viewpoint to a scientific viewpoint (the 'emic' account is seamlessly transformed into an 'etic' account). This conceptual leap fails to question the very *evaluative* nature of politeness₁ (ibid.: 242) and thereby conceals this 'evaluative moment' from analysis.

Empirical studies into commonsense ideas of politeness₁ (Blum-Kulka, 1992; Ide *et al.*, 1992) indicate that notions of politeness or impoliteness are used to characterize people's behavior judgmentally. This evaluative practice has a psychosocial dimension: individuals position themselves in moral terms *vis-à-vis* others and categorize the world into the 'well-mannered,' the 'uncouth,' etc., and a more concrete everyday dimension: it enables indexing of social identities and thus group-formation: in other words, it positively creates social realities (Eelen, 2001: 237). Politeness is said to be inherently *argumentative*: evaluative acts are not neutral taxonomic enterprises; they exist because there is something at stake socially. Moreover, carrying out an evaluative act immediately generates social effects. (ibid.: 37–38). A particularly problematic aspect of much of the theorizing about politeness is that in spite of the fact that norms are held by users to be immutable and objective (recourse to a higher, socially sanctioned reality grants moral force), and by theorists to be unanimously shared by communities, one still has to admit that the very acts of evaluation may exhibit a huge *variability*, and that this is hardly the exception.

Capturing the qualities of evaluativity, argumentativity, and variability of polite behavior requires a paradigmatic shift in our underlying philosophical assumptions. Eelen proposes to replace what he sees as a Parsonian apparatus (exemplified by "priority of the social over the individual, normative action, social consensus, functional integration and resistance to change," p. 203) with Bourdieu's (1990, 1991) theory of social practice (a proposal followed and developed by Watts, 2003). The following are some of the important consequences of this proposal.

The first is a reconceptualization of politeness as situated social action – its historicity is duly restored. Politeness is no longer an abstract concept or set of norms from which all individuals draw uniformly, but is recognized as the very object of a social dispute. Variability, resulting from the properties of evaluativity and argumentativity of politeness₁, ceases to be a problem for the researcher, and instead provides evidence of the nature of the phenomenon. As a consequence, even statistically marginal behavior

(problematic for traditional approaches: Eelen, 2001: 141) can be accounted for within the same framework.

Second, the relation between the cultural/social and the individual is seen as less deterministic. On the one hand, the cultural is part of an individual's repertoire: it is internalized and accumulated through all past interactions experienced by an individual, thus determining the nature of that individual's *habitus* (or set of learned dispositions; Bourdieu, 1991). On the other hand, the cultural can be acted on – be maintained or challenged – to various extents by individuals, depending on those individuals' resources, or symbolic *capital*; the cultural is never an immutable entity.

This *discursive* understanding of politeness enables us to capture the functional orientation of politeness to actions of social inclusion or exclusion, alignment or distancing (and incidentally uncovers the fundamentally ideological nature of scientific metapragmatic talk on politeness, as one type of goal oriented social practice; see Glick, 1996: 170) (see **Discourse Markers**).

Politeness ceases to be deterministically associated with specific linguistic forms or functions (another problem for past approaches): it depends on the subjective *perception* of the meanings of such forms and functions. Moreover, in Watts's (2003) view, behavior that abides by an individual's expectations based on 'habitus' (i.e., unmarked appropriate behavior) is not necessarily considered politeness: it is instead simply *politic behavior*. Politeness may thus be defined as behavior in excess of what can be expected (which can be received positively or negatively but is always argumentative), whereas impoliteness similarly is characterized as nonpolitic behavior (on the important issue of the theoretical status of *impoliteness*, see Eelen, 2001: 87 and Watts, 2003: 5).

As sketched here, the path followed by the discourse on politeness illustrates how the struggle over the meaning and the social function of politeness is at the very centre of current theorizing. Watts adopts a rather radical position and rejects the possibility of a theory of politeness² altogether: scientific notions of politeness (which should be nonnormative) cannot be part of a study of social interaction (normative by definition) (Watts, 2003: 11). Others, like House (2003, 2005), or O'Driscoll (1996) before her, maintain that a descriptive and explanatory framework must include universal (the first two below) and culture/language-specific levels (the last two below):

1. a fundamental biological, psychosocial level based on animal drives (*coming together* vs. *noli-me-tangere*)

2. a philosophical level to capture biological drives in terms of a finite number of principles, maxims, or parameters
3. an empirical descriptive level concerned with the particular (open-ended) set of norms, tendencies, or preferences
4. a linguistic level at which sociocultural phenomena have become 'crystallized' in specific language forms (either honorifics or other systemic distinctions)

(adapted from House, 2003, 2005).

Future Perspectives

Although the legacy of the 'mainstream' pragmatic approaches described above is clearly still very strong (see, for instance, Fukushima, 2000; Bayraktaroğlu and Sifianou, 2001; Hickey and Stewart, 2005; Christie, 2004), the critical thoughts introduced in the current debate on linguistic politeness promise to deliver a body of work radically different from the previous one.

The future program of politeness research begins from the task of elaborating a full-fledged theoretical framework from the seminal ideas recently proposed. It must acknowledge the disputed nature of notions of politeness and explore the interactional purposes of evaluations (see, for example, Mills's 2003 study on gender, or Watts's 2003 'emergent networks'; compare also Locher's 2004 study on the uses of politeness in the exercise of power). It must articulate how norms come to be shared and how they come to be transformed; it must explore the scope and significance of variability. Relevance theory, Critical Discourse Analysis, and Bourdieuan sociology have all been proposed as promising frameworks for investigation. Empirical research that can provide methodologically reliable data for these questions must also be devised: the new paradigm would dictate that the situatedness of the very experimental context, the argumentativity of the specific practice observed are recognized as integral part of the relevant data.

Politeness consistently features in international symposia, and has, since 1998, had a meeting point on the Internet; the year 2005 will see the birth of a dedicated publication, the *Journal of Politeness Research*.

Politeness Strategies as Linguistic Variables

J Holmes, Victoria University of Wellington,
Wellington, New Zealand

© 2006 Elsevier Ltd. All rights reserved.

Although linguists have had a good deal to say about it, politeness is not just a matter of language. When people say about someone, “she is very polite,” they are often referring to respectful, deferential, or considerate behavior which goes well beyond the way the person talks or writes. In Japan, for example, polite behavior encompasses bowing respectfully; in Samoan culture, being polite entails ensuring you are physically lower than a person of higher status. And in formal situations, all cultures have rules for behaving appropriately and respectfully, which include ways of expressing politeness nonverbally as well as verbally. In this article, however, we will focus on linguistic politeness and the social factors that influence its use. We begin by addressing the question ‘What is linguistic politeness?’

What Is Linguistic Politeness?

Language serves many purposes, and expressing linguistic politeness is only one of them. In example 1, the main function of the interaction can be described as informative or referential. The two people know each other well, and they do not engage in any overt expressions of linguistic politeness. [Note: Specialized transcription conventions are kept to the minimum in the examples in this article. + marks a pause; place overlaps between // and /. Strong STRESS is marked by capitalization.]

- (1) Context: Two flatmates in their kitchen
Rose: what time's the next bus?
Jane: ten past eight I think

By contrast, in example 2 (from Holmes and Stubbe, 2003: 37), there are a number of features which can be identified as explicit politeness markers.

- (2) Context: Manager in government department to
Ana, a new and temporary administrative
assistant replacing Hera's usual assistant.
Hera: I wondered if you wouldn't mind
spending some of that time in
contacting + while no-one else is around
contacting the people for their interviews

Hera's basic message is ‘set up some interviews.’ However, in this initial encounter with her new assistant, she uses various politeness devices to soften her directive: the hedged syntactic structure, *I wondered if you wouldn't mind*, and the modal verb (*would*). Providing a reason for being so specific about when

she wants the task done could also be regarded as contributing to mitigating the directive. Hera's use of these politeness devices reflects both the lack of familiarity between the two women, and the fact that, as a ‘temp,’ Ana's responsibilities are not as clearly defined as they would be if she had been in the job longer. This illustrates nicely how linguistic politeness often encodes an expression of consideration for others.

Linguistic politeness has generally been considered the proper concern of ‘pragmatics,’ the area of linguistics that accounts for how we attribute meaning to utterances in context, or “meaning in interaction” (Thomas, 1995: 23). If we adopt this approach, then politeness is a matter of specific linguistic choices from a range of available ways of saying something. Definitions of politeness abound (see, for example, Sifianou, 1992: 82–83, Eelen, 2001: 30–86), but the core of most definitions refers to linguistic politeness as a ‘means of expressing consideration for others’ (e.g., Holmes, 1995: 4; Thomas, 1995: 150; Watts, 2003). Note that there is no reference to people's motivations; we cannot have access to those, and arguments about one group being intrinsically more polite or altruistic than another are equally futile, as Thomas (1995: 150) points out. We can only attempt to interpret what people wish to convey on the basis of their utterances; we can never know their ‘real’ feelings. We can, however, note the ways in which people use language to express concern for others' needs and feelings, and the ways that their expressions are interpreted. Linguistic politeness is thus a matter of strategic interaction aimed at achieving goals such as avoiding conflict and maintaining harmonious relations with others (Kasper, 1990).

Different cultures have different ways of expressing consideration for others, and the most influential work in the area of linguistic politeness, namely Brown and Levinson's Politeness Theory (1978, 1987), adopts a definition of politeness that attempts to encompass the ways politeness is expressed universally. This involves a conception of politeness that includes not only the considerate and nonimposing behavior illustrated in example 2, which they label ‘negative politeness’ (Brown and Levinson, 1987: 129), but also the positively friendly behavior illustrated in example 3. (see also Lakoff, 1975, 1979).

- (3) Context: Small talk between workers in a plant nursery at the start of the day. Des is the manager. Ros is the plant nursery worker.
Des: be a nice day when it all warms up a bit though
Ros: yeah + it's okay
Des: so you haven't done anything all week eh you haven't done anything exciting

This is classic social talk: the content is not important; the talk is primarily social or affective in function, designed to establish rapport and maintain good collegial relationships. Brown and Levinson (1987: 101) use the term 'positive politeness' for such positive, outgoing behavior. Hence, their definition of politeness includes behavior which actively expresses concern for and interest in others, as well as nonimposing distancing behavior. Linguistic politeness may therefore take the form of a compliment or an expression of goodwill or camaraderie, or it may take the form of a mitigated or hedged request, or an apology for encroaching on someone's time or space.

Politeness Theory

Brown and Levinson's definition describes linguistic politeness as a means of showing concern for people's 'face,' a term adopted from the work of Erving Goffman. Using Grice's (1975) maxims of conversational cooperation (see Grice, Herbert Paul), they suggest that one reason people diverge from direct and clear communication is to protect their own face needs and take account of those of their addressees. While it is based on the everyday usages such as 'losing face' and 'saving face,' Brown and Levinson develop this concept considerably further, and they analyze almost every action (including utterances) as a potential threat to someone's face. They suggest that linguistic politeness comprises the use of interactional

strategies aimed at taking account of two basic types of face needs or wants: firstly, positive face needs, or the need to be valued, liked, and admired, and to maintain a positive self-image; and secondly, negative face needs or the need not to be imposed upon, the need for relative freedom of thought and action, or for one's own 'space.' As illustrated in example 2, behavior that avoids impeding or imposing on others (or avoids 'threatening their face') is described as evidence of 'negative politeness,' while sociable behavior conveying friendliness (as in example 3), or expressing admiration for an addressee is 'positive politeness' behavior (Brown and Levinson, 1987) (Figures 1 and 2). Adopting this approach, any utterance that could be interpreted as making a demand or intruding on another person's autonomy may qualify as a potentially face threatening act (FTA). Even suggestions, advice, and requests may be experienced as FTAs, since they potentially impede the addressee's freedom of action.

Brown and Levinson (1987) outline a wide range of different kinds of politeness strategies, including, as positive politeness strategies, making offers, joking, and giving sympathy, and, as negative politeness strategies, hedging, apologizing, and giving deference (see figures 3 and 4 in Brown and Levinson, 1987: 102 and 131). In support of their claims for the universality of their theory, they illustrate these strategies with numerous examples from three different languages: South Indian Tamil, Tzeltal, a Mayan

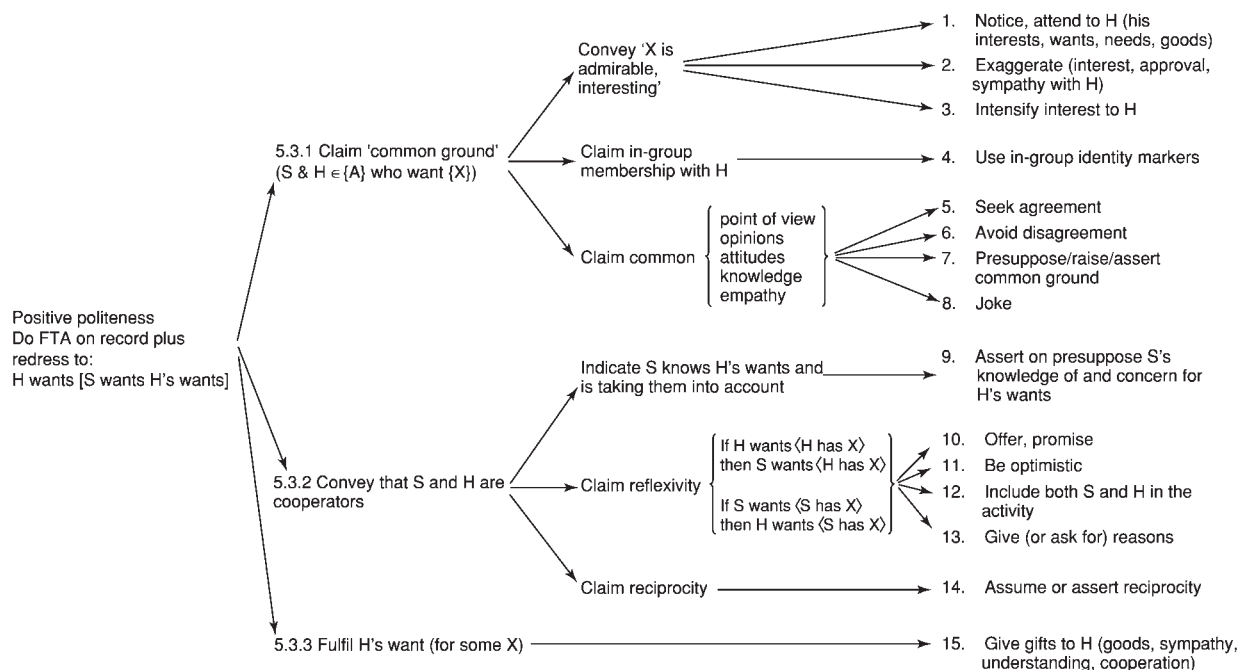

Figure 1 Chart of strategies: Positive politeness. From Brown, P. and Levinson, S.C. (1987). *Politeness. Some universals in language usage*. Cambridge: Cambridge University Press. © Cambridge University Press. Reproduced with permission.

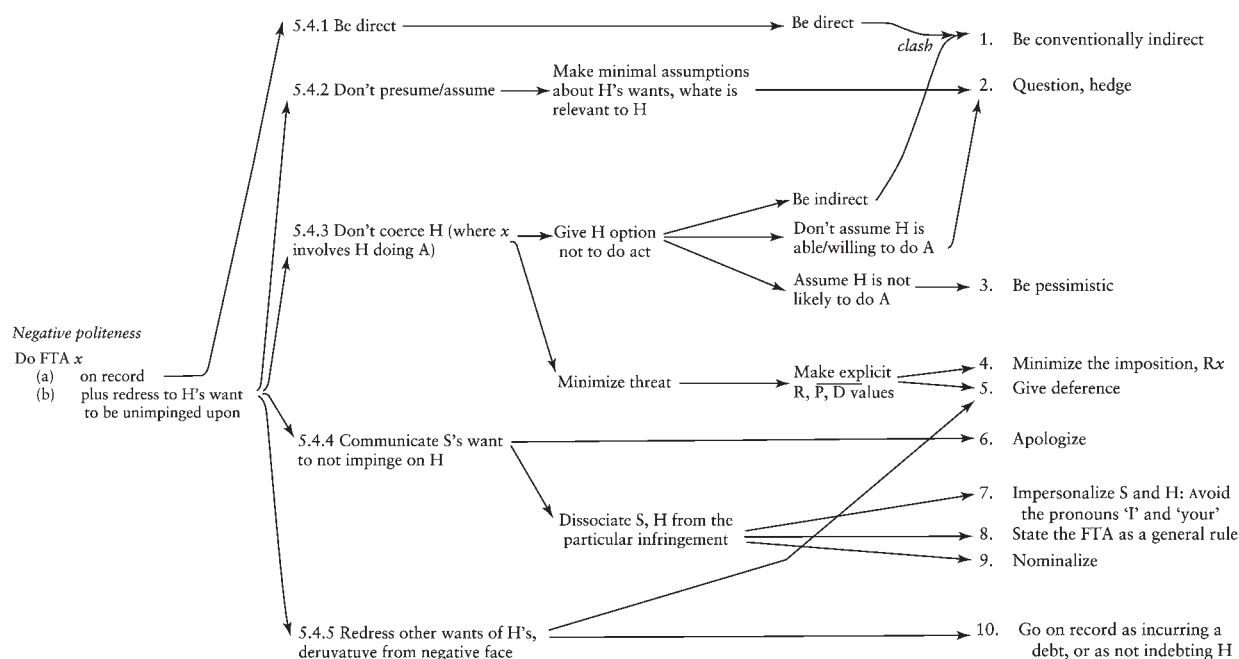

Figure 2 Chart of strategies: Negative politeness. From Brown, P. and Levinson, S.C. (1987). *Politeness. Some universals in language usage*. Cambridge: Cambridge University Press. © Cambridge University Press. Reproduced with permission.

language spoken in Mexico, and American and British English. Example 4 is an illustration from Tzeltal of the use of the negative politeness strategy of hedging, in the form of the particles *naš* and *mak*, to mitigate a FTA and thus render the utterance more polite.

- (4) ha? *naš* ya smel yoʔtan, *mak*
 It's *just* that he's sad, *I guess*
 [Final segment in *naš* is the sound at the beginning of 'ship']

Since this example, from Brown and Levinson, 1987: 149, like many others, is provided by them without contextual information, the reader has no way of assessing exactly why the utterance is interpretable as a FTA, a point I return to below.

Brown and Levinson do, however, recognize the importance of three fundamental sociocultural variables in assessing the relative weight of different FTAs: firstly, the social distance (D) between the participants; secondly, the power (P) that the addressee has over the speaker; and thirdly, the ranking of the imposition (R) expressed in the utterance in the relevant culture. Moreover, they note that the way these variables contribute will differ from culture to culture. Each of these components contributes to the relative seriousness of the FTA, and thus to the assessment of the appropriate strategy or level of politeness required to express the speaker's intended message. So, for example, if my son wants to borrow my car, he

is likely to judge that although he knows me well (low D), I have a relatively high amount of power in our relationship (compared, say, to his relationship with his brother, though perhaps not as much as is involved in his relationship with his boss), and that he is asking a big favor (high R). He is therefore likely to select a linguistically very polite way of asking this favor, as illustrated in example 5.

- (5) Context: Son to mother in the family living room
 [+ marks a very short pause]
 D: um mum + um do you think um I could
 possibly just borrow your car +
 M: [*frowns*]
 D: um just for a little while +
 M: um well [*frowns*]
 D: it's just that I need to get this book to
 Helen tonight

In making his request, D includes a number of negative politeness strategies in the form of mitigating devices or hedges (hesitation markers *um*, modal verb *could* and particle *possibly*, minimizers *just*, *a little*) as well as the positive politeness strategies of using an in-group identity marker (*mum*) and providing a reason for the request. If he had been asking for a lift or a loan for bus fare, the weight of the imposition would have been considerably less of a FTA in New Zealand culture. In cultures where cars are either more or less valuable, the imposition represented by such a request would be ranked differently; and

if the requestor was an equal or superior (such as a husband in some cultures), the P variable would be reduced. Thus the theory attempts to take account of contextual and social considerations and cultural contrasts.

The following sketch by Harry Enfield illustrates how the factors D, P, and R interact in different ways with a consequent effect on the different politeness strategies evident in the way Kevin and his friend Perry speak to (a) Kevin's parents, (b) Perry's parents on the phone, and (c) each other.

Transcript 1: 'Kevin the Teenager'

Father: Thanks, mum +
 Father: Kevin.
 Kevin: What?
 Father: Are you gonna thank your mum?
 Kevin: Ugh! Deurgh! +
 Father: Are you going to say thank you?
 Kevin: I JUST BLOODY DID!
 Mother: Forget it, Dave – it's not worth it.
 Kevin: *[sighs]*
 Father: Oh, this is lovely, mum [to Kevin] How's the exam today?
 Kevin: Mawight.
 Father: What was it today – maths?
 Kevin: Ner. Nurrr. +
 Father: Sorry, what did you say?
 Kevin: Urgh!
 P-H-Y-S-I-C-S! +
 Mother: Well, we can't hear you if you mumble,
 Kevin! Kevin: Muh! Uh! Nuh-muh!
[the doorbell rings. Kevin goes to answer it]
 Kevin: Awight, Perry?
 Perry: Awight, Kev? 'ere – guess wot I dun at school today? I rubbed up against Jennifer Fisher an' me groin wen' 'ard!
 Perry: Hmm?
 Father: Hello, Perry!
 Mother: Hello, Perry! How are you?
 Perry: 'ullo, Mrs Patterson, Mr Patterson.
 Mother: How are your mum and dad?
 Perry: All right, thank you.
 Kevin: Come on, Perry – let's go.
 Father: Kevin?
 Kevin: What?
 Father: Where d'you think you're going with all that food?
 Kevin: Bedroom. Snack.
 Mother: Your dinner's on the table – come and finish it.
 Kevin: Ugh! P-e-r-r-y!
 Father: Well, Perry can join us. Now, come and sit down.
 Kevin: *[snorts]* So unfair!
 Mother: Now – do you want something to eat, Perry?
 Perry: No thanks, Mrs Patterson.
 Mother: Are you sure?
 Kevin: HE JUST BLOODY SAID "NO"!

Father: Kevin. Don't shout at your mum.
 Kevin: What? I didn't say anything! What? Ugh! Ugh! Ugh! Ugh!
 Father: Oh, Perry – I think you've known us long enough not to call us Mr and Mrs Patterson any more.
 Kevin: Eurgh!
 Father: Just call us Dave and Sheila.
 Kevin: (Eurgh!)
 Mother: Is that OK, then?
 Perry: Yes, Mrs Patterson +
 Mother: So – what sort of music do you like at the moment, Perry?
 Kevin: Eurgh!
 Mother: I think Bad Boys Inc. are rather fun.
 Perry: Bad Boys Inc. suck, Mrs Patterson +
 Mother: So – who do you like, then?
 Perry: We only like Snoop Doggy Dog.
 Mother: Oh, from Peanuts.
 Kevin: Muh-eeurgh!
 Kevin: Finished! Come on, Perry.
 Mother: No, no, darling-you've still got pudding.
 Kevin: Agh! I don't want any bloody pudding!
 Mother: It's Chocolate Choc Chip Chocolate Ice-cream with Chocolate Sauce. But you don't have to have any if you don't want it.
 Kevin: Mmmnnnnrrrr!
 Mother: Perry, would you, er, like –
 Perry: Yes please, Mrs Patterson. Please. Thank you, Mrs Patterson. Please. Thank you!
[slight pause as the icecream is shared out]
 Father: Have you got a girlfriend yet, Perry?
 Perry: Munurr!
 Father: I remember I got my first girlfriend when I was about your age. Tracey Thornton. I remember our first snog. Outside the cinema.
 Kevin: Eeeeuurrghh!
 Mother: I was fourteen when I had my first snog.
 Kevin: *[whimpers]*
 Perry: I gotta go toilet!
 Kevin: YOU'RE SO BLOODY EMBARRASSING!
 Mother: Why can't you be a nice, polite boy – like Perry?
[the telephone starts ringing]
 Kevin: Ugh! WHAT? WHAT'S WRONG WIT ME? WHAT'S BLOODY WRONG WIIH ME EH?
 Kevin: Hello? Mnuh! Hello, Mrs Carter. Yes, Perry is here, yes. Oh, very well, thank you. Yes, would you like to speak to him? Please? Yes?
[to Perry] Perry – it's your mum.
 Perry: Eek!
 What? NO! I DON'T WANT TO! NO! IT'S SO UNFAIR! I HATE YOU! YOU'RE SO BLOODY EMBARRASSIN'! I HATE YOU!
 Perry: I gotta go now, Mrs Patterson. Fank you
 Father: Cheerio, Perry!
 Mother: Bye, Perry!
 Kevin: See ya
 Perry: Later
 Kevin: So you like him more than me do you? I HATE YOU! I WISH I'D NEVER *BEEN BORN!*

Criticisms of Brown and Levinson's Theory

While it has been hugely influential, Brown and Levinson's theory has attracted a good deal of criticism. I here mention just a few of the most frequently cited conceptual weaknesses. See Craig *et al.* (1986) and Coupland *et al.* (1988) for valuable early critiques, and Eelen (2001) and Watts (2003) for more recent, thorough reviews of criticisms.

Firstly Brown and Levinson's theory relies heavily on a version of speech act theory that assumes the sentence as its basic unit and places the speaker at the center of the analysis. Much early work that used Brown and Levinson's model adopted this focus on the utterance: e.g., some researchers asked people to judge single decontextualized utterances for degrees of politeness (e.g., Fraser, 1978). However, it is clear that FTAs are certainly not expressed only in sentences or even single utterances. Often they extend over several utterances and even over different turns of talk, as illustrated in example 5. Meaning-making is a more dynamic process than Brown and Levinson's approach allows for, and is often a matter of interactional negotiation between participants.

Secondly, Brown and Levinson have been criticised for mixing up different types of data, and providing very little indication of its source or context. As they admit in the extensive introduction to their 1987 book, their data is "an unholy amalgam of naturally occurring, elicited and intuitive data" (1987: 11), and, moreover, readers have no way of knowing which is which. Most current researchers in the area of pragmatics and discourse analysis use naturally occurring recorded data, and they provide information about the context in which it was produced.

Thirdly, the levels of analysis of different politeness strategies are quite different. So, for instance, negative politeness strategy 3, 'Be pessimistic,' is very much more general and can be realized in a very much wider variety of ways than strategy 9, 'Nominalize,' which identifies a very specific syntactic device that can be used for distancing the speaker from the addressee. In addition, overall, negative politeness strategies involve a more specific range of linguistic devices (e.g., hedge, nominalize, avoid the pronouns 'I' and 'you') than positive politeness strategies, which seem much more open-ended and difficult to restrict.

Fourthly, context is crucial in assessing politeness, but the range of social factors which may be relevant in analyzing the weight of a FTA is much more extensive than the three Brown and Levinson identify. Factors such as the level of formality of the speech event, the presence of an audience, the degree of liking between the participants, and so on, may well affect

the weightiness of the FTA, or even the judgment about whether an utterance counts as polite at all. So, for example, as Thomas (1995: 156) points out, "if you'll be kind enough to speed up a little" appears superficially to be a very polite way of saying "hurry up," but in the context in which it was produced, addressed by a wife to her husband, it expressed intense irritation. And while Brown and Levinson's rather flexible concept R might be a means of taking account of some of these additional factors, computing R clearly requires detailed familiarity with relevant sociocultural and contextual values.

Fifthly, Brown and Levinson's theory assumes an ideal and very individualistic intentional agent (labelled a Model Person) as its starting point, and has been criticised by many researchers as culturally very restricted and even Anglo-centric in basic conception (e.g., Ide *et al.*, 1992; Eelen, 2001; Watts, 2003). Asian and Polynesian societies, for instance, place a greater emphasis on public undertakings and social commitments (a point discussed further below), and are not interested in trying to figure out what a speaker intended by a particular speech act (e.g., Lee-Wong, 2000); but this is a basic requirement of any analysis using Brown and Levinson's framework. The implication of these criticisms is that a theory of politeness based on intention recognition cannot apply cross-culturally and universally.

Measuring Politeness

Brown and Levinson's very specific approach to identifying ways of expressing linguistic politeness led to a spate of empirical studies which explored manifestations of politeness in a wide range of contexts and cultures and in many disciplines, including social and cognitive psychology, legal language, communication studies, gender studies, business and management studies, second language acquisition, and cross-cultural communication. A number of these researchers attempted to use Brown and Levinson's list of strategies as a basis for quantification. Shimanoff (1977), for instance, identified 300 different politeness strategies in an attempt to compare the number of politeness strategies used by men and women in interaction. She found no sex differences but she also found that the distinction between positive and negative politeness strategies was sometimes difficult to maintain. Moreover, there was often an unsatisfactory relationship between the number of strategies used and the intuitions of native speakers about how polite an utterance is (see also Brown, 1979).

It soon became apparent that counting strategies is basically a fruitless exercise, since context is so important for interpreting the significance of any

linguistic form, and, moreover, the balance of different strategies may be crucially important in assessing the overall effect of a contribution to an interaction. In the following script for the video 'Not Like This', for example, Lorraine uses teasing humor, a positive politeness strategy, to soften her criticism of Sam's inadequate checking of the packets of soap powder.

Transcript 2: 'Not Like This' (*Clip 7 from Talk that Works*)

Context: Factory packing line.

The supervisor, Lorraine, has noticed that Sam is not doing the required visual check on the boxes of soap powder as they come off the line, and she stops to demonstrate the correct procedure. [+ marks a pause; place overlaps between // and /]

1. Lor: [*picks up a box and pats it*]
2. you know when you check these right
3. you're supposed to look at the carton
4. to make sure it's not leaking
5. not like this [*pats box and looks away*]
6. Sam: oh that's that's good checking
7. Lor: /you're not going to see anything if you're like this\
8. Sam: /that's all right that's all right\ that's all right
9. Lor: oh my gosh [smiles]
10. Sam: [*laughs*] ++ [*picks up a box and gives it a thorough shake*]
11. Lor: and what's with the gloves
12. Sam: [*smiling*] don't want to get my hands dirty
13. Lor: don't want to ruin your manicure

It is clear that counting how many times she expresses the criticism (lines and 3, 5, perhaps 7) is not only tricky but also meaningless in terms of measuring the FTA. Similarly, while it is clear that the humorous exchange between the pair functions as positive politeness, analyzing its precise relationship to the FTA and assessing the precise relative contribution of different components is very complex and ultimately pointless.

In addition, many utterances are multifunctional and assigning just one meaning to a linguistic device is thus equally misleading. We cannot know if Lorraine's question "and what's with the gloves?" (line 11) is asking for information (i.e., she is genuinely puzzled or concerned about why Sam needs to wear gloves), or if this is a preliminary tease which she follows up more explicitly in line 13. Leech (1983) also notes that utterances are often (deliberately) ambivalent, allowing people to draw their own inferences about what is intended, and even about whether they are the intended addressee. As Thomas notes, example 6 (from Thomas, 1995: 159) is a "potentially very offensive speech act (requesting people not to steal!)," but it is expressed in an ambivalent form, allowing readers to decide about the precise

degree of pragmatic force, and whether it applies to them.

These newspapers are for all the students, not the privileged few who arrive first.

Leech's Politeness Principle

There are a number of alternatives to Brown and Levinson's approach to the analysis of politeness (see Eelen, 2001: 1–29). Some share a good deal with Brown and Levinson's approach; others provide elaborations which address some of the criticisms identified above. Robin Lakoff has been labeled "the mother of modern politeness theory" (Eelen, 2001: 2), and her work (1973, 1975) predates Brown and Levinson's (1978) substantial model by several years. However, her 'rules of politeness' (Don't impose, Give options, Be friendly) have a good deal in common with Brown and Levinson's politeness strategies. Another approach by Fraser (1990: 233) provides a very broad view of politeness: being polite is regarded as the default setting in conversational encounters, i.e., simply fulfilling the 'conversational contract.'

One of the most fully developed alternative frameworks is Geoffrey Leech's model, which was developed at about the same time as Brown and Levinson's (Leech, 1983), and which shares many of the assumptions of their approach, as well as their goal of universality, but takes a somewhat different tack in analyzing linguistic politeness. Rather than focusing on 'face needs,' Leech addressed the issue of "why people are often so indirect in conveying what they mean" (1983: 80). To answer this question, (i.e., basically to account for why people do not consistently follow Grice's Cooperative Principle and adhere to his Maxims (see Grice, Herbert Paul; Neo-Gricean Pragmatics). Leech proposed a Politeness Principle (PP), and a set of maxims which he regards as paralleling Grice's Maxims. Leech's PP states:

Minimize (other things being equal) the expression of impolite beliefs. ... Maximize (other things being equal) the expression of polite beliefs (1983: 81).

So, for example, recently my niece asked me if I liked her new shoes – bright pink plastic sandals, decorated with glitter. I thought they were ghastly, but rather than saying "I think they're awful," I replied "they look really cool." The Politeness Principle accounts for my nicely ambiguous response, which was strictly truthful but minimized the expression of my very impolite beliefs about her shoes.

Leech's set of maxims is very much larger than Grice's four, and while some are very general, others

(such as the Polyanna Principle) are “somewhat idiosyncratic,” to quote Thomas (1995: 160). The more general ones are the maxims of Modesty, Tact, Generosity, Approbation, Agreement, and Sympathy. The Modesty Maxim, for example, states “Minimize the expression of praise of self; maximize the expression of dispraise of self.” Obviously this maxim applies differentially in different cultures. In parts of Asia, including Japan, for instance, this maxim takes precedence over the Agreement Maxim, which states that agreement should be maximized and disagreement minimized. Hence Japanese and Indonesian students in New Zealand often reject a compliment, denying it is applicable to them, as illustrated in examples 7 and 8.

- (7) Context: Two Malay students in Wellington, New Zealand. This interaction takes place in English.
 S: eeee, nice stockings
 R: ugh! there are so many holes already
- (8) Context: Teacher to a Japanese student who is waiting outside the teacher's room in the corridor
 T: what a beautiful blouse
 S: [*looks down and shakes her head*] no no
 T: but it looks lovely
 S: [*stays silent but continues to look down*]

People from Western cultures, on the other hand, are more likely to allow the Agreement Maxim to override the Modesty Maxim, and this accounts for the greater tendency among New Zealanders to agree with a compliment, although they may downgrade it or shift the credit for the object of the praise, as illustrated in example 9.

- (9) M: that's a snazzy scarf you're wearing
 S: yeah it's nice isn't it my mother sent it for my birthday

Leech's maxims thus provide a way of accounting for a number of cross-cultural differences in politeness behavior, as well as in perceptions of what counts as polite in different cultures and subcultures.

The main problem with Leech's approach to the analysis of politeness, as a number of critics have pointed out (e.g., Thomas, 1995; Brown and Levinson, 1987; Fraser, 1990), is that there is no motivated way of restricting the number of maxims. This means it is difficult to falsify the theory since any new problem can be countered by the development of yet another maxim. Thomas (1995: 168) suggests that the maxims are better treated as a series of social-psychological constraints on pragmatic choices, which differ in their relative importance in different cultures. Adopting this approach, their open-endedness is not such a problem.

Post-Modern Approaches to Politeness

More recently a number of researchers have adopted a post-modern approach to the analysis of politeness, challenging the “transmission model of communication” (Mills, 2003: 69), and questioning the proposition that people necessarily agree on what constitutes polite behavior (e.g., Eelen, 2001; Locher, 2004; Mills, 2003; Watts, 2003). Researchers such as Brown and Levinson (1987), Leech (1983), and Thomas (1995: 204–205) support their analyses of the interactional meaning of an exchange with evidence such as the effect of an utterance on the addressee, and by referring to metalinguistic commentary and the development of the subsequent discourse. By contrast, post-modernist researchers eschew any suggestion that the meaning of an utterance can be pinned down. They emphasize the dynamic and indeterminate nature of meaning in interaction, including the expression of politeness.

This approach emphasizes the subjectivity of judgements of what counts as polite behavior; meaning is co-constructed, and hence politeness is a matter of negotiation between participants. Adopting this framework, interaction is regarded as a dynamic discursive struggle with the possibility that different participants may interpret the same interaction quite differently.

Gino Eelen (2001) led this revolution in politeness research with his in-depth critique of earlier so-called structuralist, positivist, or objective approaches to the analysis of linguistic politeness. Following Bourdieu, he provides a detailed outline of a post-modern approach which synthesizes subjective and objective approaches by focusing on social practice. Eelen makes a fundamental distinction between what he called ‘first-order (im)politeness,’ referring to a common-sense, folk, or lay interpretation of (im)politeness, and ‘second-order (im)politeness’ to refer to (im)politeness as a concept in sociolinguistic theory (2001: 30). He also uses the term ‘expressive politeness’ (2001: 35) to describe instances where participants explicitly aim to produce polite language: e.g., use of polite formulae such as *please* or *I beg your pardon*. These terms, or at least the distinctions they mark, have proved useful to others who have developed Eelen's approach in different ways.

Mills (2003), for instance, uses this framework to analyze the role of politeness in the construction of gendered identities in interaction. She dismisses attempts to capture generalizations and to develop a universal theory of politeness, arguing that politeness is a contentious concept. Her approach places particular emphasis on the role of stereotypes and norms as influences on people's judgements of

gender-appropriate politeness behavior. In assessing the politeness of an act you have to make a judgement of 'appropriateness' "in relation to the perceived norms of the situation, the CofP [community of practice], or the perceived norms of the society as a whole" (2003: 77; though it must be said that it is not clear how the analyst establishes such judgments, especially since post-modernists strongly critique quantitative methodology, and tend to rely on rather small data sets).

The following excerpt from the film *Getting to Our Place* illustrates the relevance of perceived norms in the interpretation of the degrees of politeness and impoliteness expressed in a particular interaction between two New Zealanders. The interaction involves the powerful and influential Sir Ron Trotter, Chairman of the Board planning the development of the New Zealand National Museum, and Cliff Whiting, the highly respected Maori museum CEO. The museum is to include within it a marae, a traditional Maori meeting house and surrounding area for speech-making, for which Cliff Whiting is responsible. At the beginning of the excerpt, Sir Ron Trotter is just finishing a statement of how he sees the museum marae as being a place where pakeha (non-Maori) will feel comfortable (whereas most New Zealand marae are built by and for Maori in tribal areas).

Transcript 3: Excerpt from the film *Getting to Our Place* [+ marks a pause; place overlaps between // and /; (...) indicates an unclear word. Strong STRESS is marked by capitalization.]

RT: but comfortable and warm and + part of the place ++ for any Pakeha who er ++ part of the (...) that we talked about in the concept of we're trying to + develop
CW: there are two main fields that have to be explored and er + the one that is most important is it's customary role in the first place because marae comes on and comes from + the tangatawhenua who are Maori ++ /to change it\

RT: /but it's not just\ for Maori

CW: /no\

RT: you you MUST get that if it is a Maori institution and nothing more.

THIS marae has failed + and they MUST get that idea

CW: /how\

RT: because

CW: /(...)\

RT [*shouts*]: we are bicultural + bicultural (talks about two) and if it is going to be totally Maori ++ and all + driven by Maori protocols and without regard for the life museum is a is a Pakeha concept

Many New Zealanders viewing this episode perceive Sir Ron's behavior as rude, and specifically comment on his disruptive interruption of Cliff Whiting's verbal contribution, and on the way Sir

Ron Trotter raises the volume of his voice as he talks over the top of others. This assessment and interpretation of the interactional meaning of what is going on here draws on generally recognized norms for interaction in New Zealand society. In fact, analyses of cross-cultural differences in interactional patterns between Maori and Pakeha (Stubbe and Holmes, 1999) suggest that this disruption would be perceived as even more impolite by a Maori audience, since Maori discourse norms, even in casual conversation, permit one speaker to finish before another speaker makes a contribution. Stereotypical expectations and norms are thus an important contributing factor in accounting for different people's judgements of the relative politeness or impoliteness of particular interactions.

Focusing on common sense (im)politeness (i.e., Eelen's first-order (im)politeness), Watts (2003) also pays attention to the relevance of affect and sincerity judgments in an approach which emphasizes that politeness strategies may be used strategically and manipulatively. His particular contribution to research on linguistic politeness is a distinction between what he calls 'politic' behavior, i.e., socially constrained politeness, and strategic politeness, where the speaker goes beyond what is required (2003: 4). Politic behavior is "what the participants would expect to happen in this situation, and it is therefore not polite" (2003: 258). It is 'appropriate,' 'non-salient' and 'expectable' (2003: 256–257). Polite behavior is "behavior in excess of politic behavior" (2003: 259); it is marked behavior indicating the speaker's wish to express concern or respect for the addressee (Locher, 2004).

It is moreover an area where subjective judgements become relevant and is thus an area of dispute: "not everyone agrees about what constitutes polite language usage" (Watts, 2003: 252). As an example, Watts argues that there are alternative possible interpretations of the following contribution from a politician in a television debate: "can I come back on Mandy's point because I think this is one aspects of TVEI which has been really underemphasised tonight." He suggests that "some commentators might assess his expression 'can I come back on Mandy's point' ... as polite behavior; others might suggest ... that, far from being genuinely polite, he is only simulating politeness and is in reality currying favour with the person he is addressing or some other person or set of persons" (2003: 3). It is interesting to note that while both Mills and Watts highlight the indeterminacy of meaning, both researchers frequently assign interpretations quite confidently in discussing their examples.

Having outlined a number of approaches to analyzing politeness, and indicated some of their

strengths and weaknesses, the final sections of this article discusses research on the interaction of linguistic politeness with different social and cultural variables.

Social Variables and Politeness

As the discussion has indicated and the examples have illustrated, the ways in which people express or negotiate politeness is obviously influenced by a range of sociocultural variables, including power relationships, degrees of solidarity, intimacy, or social distance, the level of formality of the interaction or speech event, the gender, age, ethnicity, and social class backgrounds of participants, and so on. Kasper (1997: 382–383) provides a very extensive list of data-based studies which investigate the relevance and the complexity in sociolinguistic and sociopragmatic research of Brown and Levinson's three social variables (P, D, R) each of which is a composite sociocultural construct. The core variationist literature, however, which pays careful attention to such social variables, and which adopts rigorous statistically-based quantitative measures, rarely explicitly addresses the expression of politeness *per se*, though some have argued, controversially, that politeness may entail using more standard speech forms (Deuchar, 1988), and research on style offers potential insights into the interaction between formality and politeness.

Classifying women and men as members of different (sub-)cultures led to some interesting insights in language and gender research about the relativity of particular discourse features. So, for instance, an 'interruption' might be perceived as disruptive by one group but as supportive by another; and back-channeling or 'minimal feedback' (*mm, yeah, right*) and certain pragmatic particles (*you know, I think*) function variably and complexly as markers of (im)politeness in the usage of different social groups (e.g., Holmes, 1995). Tannen (1990), Coates (1996), and Holmes (1995), for instance, identified linguistic and pragmatic features of (respectively American, British, and New Zealand) English which were widely regarded as indicators of more polite speech, and which tended to be used more frequently in certain social contexts by middle-class, professional, and majority group women than by men from similar backgrounds.

Extending such analyses, which introduced a qualitative dimension to the analysis of linguistic and pragmatic features, the work of a number of discourse analysts further explores the influence of a range of social variables on the expression of politeness. Speech act research provides a particularly rich source

of insights into the diversity and complexity of different influences on politeness. See Kasper (1997) for a summary of relevant research up to the mid-1990s. Locher (2004) examines the interaction of power and politeness in the expression of disagreements in a family, at a business meeting, and in a political interview involving President Clinton. She demonstrates that power is most usefully regarded as dynamic, relational, and contestable, and that while participants of very different statuses exercise power as well as politeness in their use of discourse in context, status tends to influence the degree of negotiability of a disagreement in an interaction, along with many other factors, including the topic's degree of controversy, the participants' degree of familiarity with the topic, and their speaking style, cultural backgrounds, and gender. She also notes great variability in the amount and degree, and even the discursive positioning, of politeness or relational work which accompanies the exercise of power in disagreements in the interaction.

Mills (2003) also discusses the relevance of politeness as a factor in the construction of gender identity, especially in British English society. Holmes and Stubbe (2003) describe the interaction of power and politeness in a wide range of New Zealand workplaces, and Harris (2003) applies politeness theory to talk collected in British magistrates courts, doctors' surgeries, and a police station. Researchers taking this approach highlight the complexities of spoken interaction, and the importance of taking account of the differing and intersecting influences of different social factors (e.g., age, ethnicity, social class, gender) as well as contextual factors (e.g., power and social distance relations, social and institutional role, formality of the speech event, and speech activity) in accounting for the complex ways in which politeness is expressed and interpreted in the very different situations they analyze.

Cross-Cultural Analyses of (Im)Politeness

Politeness is also conceptualized and expressed very differently in different cultures (e.g., Sifianou, 1992; Kasper and Blum-Kulka, 1993; Ting-Toomey, 1994; Scollon and Scollon, 1995; Spencer-Oatey, 2000). Nwoye (1989), for example, illustrates the strategic use of euphemisms and proverbs as means of expressing face-threatening acts politely in interactions between the Igbo of Southeastern Nigeria. Using a unified theoretical framework and methodology involving discourse completion tasks which has subsequently been very influential and widely applied, Blum-Kulka *et al.* (1989) provide information on contrasting patterns in the (reported) use of politeness

strategies in speech acts such as apologies and requests in a number of languages, including English, Hebrew, Canadian French, Argentinian Spanish, German, and Danish (see also House and Kasper, 1981). This approach has been applied and adapted for many different languages and with many different speech acts (e.g. Boxer, 1993; Márquez-Reiter, 2000; and many, many more).

Focusing just on Europe, Hickey and Stewart's (2004) very useful collection of papers provides information on linguistic politeness strategies in 22 European societies, ranging from Germany, Ireland, and Belgium in western Europe to Norway, Denmark, and Finland in northern Europe; Poland, Hungary, and the Czech Republic in eastern Europe; and Greece, Cyprus, and Spain in southern Europe. The papers in Bayraktaroglu and Sifianou (2001), on the other hand, focus just on Greek and Turkish but provide information on realizations of politeness in social contexts ranging from classrooms to television interviews. The role of code-switching in the expression of politeness is also relevant in cross-cultural analyses, as illustrated, for example in a study of how London Greek-Cypriot women exploit the fact that directness is more acceptable in Greek than in English, and thus code-switch to Greek to express positive politeness in ethnically appropriate ways (Gardner-Chloros and Finnis, 2003). Greek words, phrases, and clauses are inserted in English macro-structures to soften the effect of a direct criticism, for instance, or an expression of irritation or a demand for a response is interactionally managed by shifting to Greek.

Expanding consideration to other times and cultures has led researchers to challenge some of the assumptions made about conceptions of linguistic politeness in early models. Even confining attention to English-speaking societies, there is a good deal of variation in what is included in commonsense understandings of what constitutes polite behavior. As Watts points out, understandings "range from socially 'correct' or appropriate behavior, through cultivated behavior, considerateness displayed to others, self-effacing behavior, to negative attributions such as standoffishness, haughtiness, insincerity, etc." (2003: 8–9). Nevertheless, a good deal of early research reflected a rather Western and even middle-class British English conception of politeness. These ethnocentric assumptions were often challenged by researchers from other cultures.

Researchers on Asian cultures, for instance, pointed to the importance of recognizing that in some languages, a speaker's use of certain polite expressions (and specifically honorifics) is a matter of social convention ('discernment') or social indexing

(Kasper, 1990) rather than strategic choice (e.g., Ide *et al.*, 1992; Matsumoto, 1989; Usami, 2002; Mao, 1994). (Fukushima (2000) argues that social indexing is a sociolinguistic rather than a pragmatic matter and as such is irrelevant to the analysis of [strategic] politeness.) These researchers point out that Western conceptions of 'face' are very individualistic, and approaches to politeness based on such conceptions do not account satisfactorily for more socially based notions, such as the twin Chinese concepts of 'mien-tzu' (or 'mianzi') and 'lien' (or 'lian'). 'Mien-tzu' refers to "prestige that is accumulated by means of personal effort or clever maneuvering," and is dependent on the external environment (Hu, 1944: 465), while 'lien' is the respect assigned by one's social group on the basis of observed fulfilment of social obligations and moral integrity. Loss of 'lien' makes it impossible for a person to function properly within the community. "*Lien* is both a social sanction for enforcing moral standards and an internalized sanction" (Hu, 1944: 45). This is a rather different conception of face than that used in Brown and Levinson's theory, and it influences conceptions of what is considered 'polite' as opposed to required by social sanction and sociolinguistic norms.

So, for example, in some languages (e.g., Chinese, Japanese, Korean) choice of stylistic level and address forms are largely a matter of social convention or 'linguistic etiquette'; respect or deference is encoded in certain linguistic forms which are required when talking to one's elders or those of higher status, for instance. It has been argued that such sociolinguistically prescribed deference behavior must first be taken into account in assessing 'politeness' (Usami, 2002). (There is an obvious parallel here with Watts' 'polite/politic' distinction mentioned above which was formulated in part to take account of this cross-cultural issue.) So, in assessing politeness, Chinese participants, for instance, evaluate both whether an appropriate degree of socially prescribed respect or deference has been expressed, as well as the extent to which the addressee's face needs are addressed discursively in any specific interaction (Lee-Wong, 2000; Usami, 2002). Lee-Wong shows, for instance, that sociocultural values such as 'sincerity,' 'respect,' and 'consideration' are crucially involved in a Chinese speaker's perception and conceptualization of the politeness. Moreover, in such societies the discursive expression of politeness generally involves the use of avoidance and mitigation strategies (i.e., Brown and Levinson's negative politeness strategies), and even address terms are extensively used in this way.

By contrast, in communities where social relationships are not marked so formally or encoded so explicitly in the grammar or lexicon, politeness is

expressed somewhat differently. Greek interactants' view of politeness, for instance, focuses around expressions of concern, consideration, friendliness, and intimacy, rather than imposition-avoidance and distance maintenance (Siafanou, 1992). Similarly, Bentahila and Davies (1989) claim that Moroccan Arabic culture places greater weight on positive politeness than does the British English culture, which often functions implicitly as the unacknowledged norm in politeness research. Overall, then, it is apparent that the area of the cross-cultural expression of linguistic politeness requires careful negotiation, with the ever-present danger of ethnocentric assumptions a constant potential minefield. Nonetheless, the burgeoning of research in this area in recent years, especially involving Asian researchers, suggests that better understandings of what is meant by linguistic politeness in different cultures are steadily being forged.

Impoliteness

Finally, a brief comment on impoliteness, which, despite being less researched, is at least as complex a matter as linguistic politeness. Watts comments that since breaches of politeness are salient, while conforming to politeness norms goes unnoticed, one would expect impoliteness to have attracted more attention than it has. He summarizes research on linguistic impoliteness in one brief paragraph (2003: 5), encompassing research on rude or even insulting behavior in a variety of communities, including middle-class white New Zealanders (Austin, 1990; see also Kuiper, 1991).

Austin draws on Relevance Theory to account for behavior perceived as intentionally rude. She introduced the useful term Face Attack Acts for what she calls "the dark side of politeness" (1990: 277), namely speech acts perceived as deliberately intended to insult the addressee. She provides a fascinating range of examples, including the following (from Austin, 1990: 282):

- (10) Context: Transactional interaction between member of the business community and well-educated middle-class woman [the author, Paddy Austin].
 A: Now that will be Miss, won't it?
 B: No, Ms.
 A. Oh, one of *those*.

Austin details the contextual inferencing which led her to interpret as an insult A's response to the information that she preferred the title Ms.

By contrast to such a subtle and indirect instance of impoliteness, one might think that swearing at

someone would always qualify as impolite behavior, but there is a range of research illustrating that swearing serves many different functions and that even when addressed to another person, it may serve a positive politeness solidarity function, rather than acting as an insult (see, for example, Daly *et al.*, 2004).

Some researchers incorporate the analysis of politeness within the same theoretical framework as politeness. Indeed, Eelen (2001) and Watts (2003) use the formulation (im)politeness to signal this. Mills (2003: 124) stresses that impoliteness is not the polar opposite of politeness, but her discussion (2003: 135 ff) suggests that impoliteness can be dealt with using the same analytical concepts as those relevant to the analysis of politeness (appropriacy, face threat, social identity, societal stereotypes, community norms). So, for example, the utterances produced in the Prime Minister's Question Time in the English House of Commons do *not* qualify as impolite, despite superficially appearing as if they might, because they are generally assessed as perfectly appropriate in this context (2003: 127). Thomas (1995: 157) suggests some speech acts "seem almost inherently impolite": e.g., asking someone to desist from behavior considered very offensive; in such cases the linguistic choice made will be irrelevant to politeness judgments.

Where Next?

It seems likely that exploring what counts as linguistic impoliteness will prove a challenging area for future research. Formulating a satisfactory definition of impoliteness will certainly provide a challenge for those attempting to develop adequate theoretical frameworks, as well as providing a robust testing ground for claims of universality and cross-cultural relevance, always assuming, of course, that researchers accept these as legitimate and useful goals for future research in the area of pragmatics and politeness.

Another relatively recent development is the exploration of the broader concept of 'relational practice' (Fletcher, 1999; Locher, 2004). Both solidarity-oriented, positive politeness and distance-oriented, negative politeness are fundamental components of relational practice, and it seems likely that this will be another fruitful direction for future research in the area of linguistic politeness.

Finally, the use of different languages as strategic resources in balancing different social pressures is another area where insights into cross-cultural politeness seem likely to continue to emerge over the next decade.

Development of a New Field

In this overview to the section, we deal very briefly with the history of research on Language and Politics, as well as with fields that are not or are only very briefly covered in the entire section. Moreover, we propose working definitions of basic concepts fundamental to the whole field of research. Finally, we summarize some of the most important research strands according to topic-oriented questions arising out of the developments and changes in our globalized and globalizing societies.

The entries in this overview cover the most important research domains in the field of language and politics, both on a theoretical and on a methodological level. Thus, we cover aspects of classic and modern rhetoric up to more sociologically oriented methods, such as 'frame analysis,' as well as new and hybrid multimodal genres (the Internet). We also elaborate on such topics as politics and gender, ideology, discrimination, political speeches, and the representation of war.

History of Research in the Field of Language and Politics

The research on language in/and politics in the field of linguistics seems to be quite young, although rhetoric is one of the oldest academic disciplines and was already concerned with aspects of political communication in ancient times.

After World War II, Lasswell and Leites (1949) published one of the most important studies on quantitative semantics in the field of language and politics, developing approaches from communication and mass media research. The famous economist Friedrich von Hayek (1968) similarly discussed the impact of language on politics during his stay at the London School of Economics. In the same vein, research started in Central Europe, mainly in Germany, in the late 1940s.

Moreover, the novel 1984 by George Orwell most certainly was a significant point of departure for the development of the entire field (*see Newspeak*). Of course, all this research was influenced by the massive use of propaganda in World War II and in the emerging Cold War in the 1950s.

'Political linguistics' (*Politolinguistik*) is an attempt to integrate scientific research dealing with the analysis of political discourse into an academic discipline. Klein (1998) argued that the "linguistic study of political communication" is a subdiscipline of linguistics that developed mainly in the German-speaking area since the 1950s. He cited the critical linguistic research that started in the wake of National Socialism, as it was initiated by Klemperer (1947) and Sternberger *et al.* (1957) as paving the way for the new discipline. Because these studies provoked criticism for being inadequate from the perspective of linguistic theory, a new methodological approach emerged in the late 1960s. It drew on various linguistic subdisciplines (pragmatics, text linguistics, media research) and primarily pragmatic theories or theoretical concepts. Organizational academic structures have developed only recently: For example, the "*Arbeitsgemeinschaft Sprache in der*

Politik” was registered as a nonprofit organization in 1991 and has been organizing major conferences every two years since 1989.

Political linguistics was characterized by Burkhardt (1996) in a programmatic article as a “subdiscipline between linguistics and political science” that to a large extent still needed to be established. Its purpose was to remedy the confusion of concepts identified by him in this research field. Burkhardt proposed the use of ‘political language’ as the generic term comprising “all types of public, institutional and private talks on political issues, all types of texts typical of politics as well as the use of lexical and stylistic linguistic instruments characterizing talks about political contexts.” It included talking about politics and political media language, as well as the so-called language of politics. Moreover, he suggested that a differentiation should be made between the ‘language of politicians’ and ‘language in politics’ as such. Burkhardt proposed the term ‘political linguistics’ (*Politolinguistik*) for the “hitherto nameless discipline” that was committed to studying political language (in the above sense).

Previous research in this field investigated, rather randomly, individual phenomena of political language. As particularly promising methods and techniques to be used for ‘ideological reconstruction,’ Burkhardt listed four different procedures: “lexical-semantic techniques” (analysis of catchwords and value words, of euphemisms, and of ideological polysemy); “sentence and text-semantic procedures” (e.g., analysis of tropes, of “semantic isotopes,” and of integration and exclusion strategies); “pragmatic text-linguistic techniques” (i.e., analysis of forms of address, speech acts, allusions, presuppositions, conversation, argumentation, rhetoric, quotations, genres, and intertextuality); and finally ‘semiotic techniques’ (icon, symbol, and architecture-semiotic analysis). This catalogue of methods could be particularly useful as a checklist for the concrete task of analysts. In the future, Burkhardt suggested, political linguistics should go beyond studies critical of the present and aim at comparative analysis both in diachronic and intercultural terms so as to overcome the ‘obsession’ with politicians (i.e., to make not only the language of politicians but also the ‘act of talking politics’ the subject of study). In terms of ‘bottom-up linguistics,’ the voter was to become the subject of linguistic analysis as well.

As noted above, National-Socialist language, one of the important starting points for the study of language and politics, became the object of critical philological observations first by Viktor Klemperer (1947). Utz Maas was, however, the first linguist to subject the everyday linguistic practices of National

Socialism (NS) to in-depth analysis: he used NS texts to exemplify his approach of ‘*Lesweisenanalyse*’ (Maas, 1984). His historical “argumentation analysis” based on the theories of Foucault demonstrated how discourse is determined by society (i.e., in what may be termed ‘a social practice’).

In his detailed analysis of language practices during the NS regime between 1932 and 1938, Maas was able to show how the discourses in Germany were affected by NS ideology, which was characterized by social-revolutionary undertones. Nazi discourse had superseded almost all forms of language (practices), a fact that made it difficult for the individual who did not want to cherish the tradition of an unworldly Romanticism to use language in any critical-reflective way. Discourse in Maas’s approach was understood as the result of ‘collusion’: the conditions of the political, social, and linguistic practices quasi-impose themselves behind the back of the subjects, while the actors do not “see through the game” (cf. also Bourdieu’s notion of ‘*violence symbolique*’).

Discourse analysis thus identifies the rules that make a text into a fascist text. In the same way as grammar characterizes the structure of sentences, discourse rules characterize utterances/texts that are acceptable within a certain social practice. The focus is not on NS language *per se*, but rather the aim is to record and analyze the spectrum of linguistic relations based on a number of texts dealing with various spheres of life in the Nazi period. These texts represent a complicated network of similarities that overlap and intersect. Therefore, it is also important to do justice to the ‘polyphony’ of texts resulting from the fact that social contradictions are inscribed into them. Texts from diverse social and political contexts (cooking recipes, local municipal provisions on agriculture, texts by NS politicians, and also by critics of this ideology, who were ultimately involved in the dominant discourse) are analyzed by Maas in a sample representative of almost all possible texts and genres of NS discourse; discourse is understood in the sense of linguistic ‘staging’ of a certain social practice.

Ehlich (1989) proposed different methodological approaches to “language during fascism,” including content analyses, language statistics, historical philology, semantics, and stylistics based not only on linguistic-sociological approaches but also on ‘argumentation analysis.’ He stressed the central role of linguistic activity during fascism, in which verbal action was *de facto* limited to acclamation, whereas the contrafactual impression of self-motivated activity was created in a setting of mass communication. From a perspective of “linguistic pragmatics oriented towards societal analysis” (Ehlich, 1989: 31), he identified these characteristics of fascist

linguistic action: the strategy of making communication phatic; the propositional reduction of communication, which in turn is closely linked to the promise of a 'simple world'; the order as another central pattern of linguistic action characterized *inter alia* by the systematic elimination of the listener's decision and consciousness and implying a "mandatory speechlessness of the addressee"; linguistic actions serving the purpose of denunciation, which become extremely common, a fact that has decisive effects on elementary linguistic actions, such as jokes entailing life-threatening risks. Given this mental terror, many people demonstrated 'conformity' in their linguistic actions as a form of self-protection, and sometimes linguistic action turned into linguistic suffering mainly expressed by silence. Against this background, only a minority managed to transform suffering into linguistic resistance, which had to be anonymous and subversive.

Language and Politics/Language Policies/ Language Planning

The delimitation between different research areas and topics in the context of language and/in politics is by nature difficult, and the distinction between language and politics/language policies and language planning is blurred. Although this extensive area cannot be covered in detail in this section (see **Language Planning and Policy: Models**), it does highlight some basic facts about language policies.

Language policies deal with two main areas: (1) political measures targeted at an individual language (e.g., the prohibition of certain terms), or (2) the relations among different languages and their social importance, function, relevance in international communication, etc. Measures that target usage of an individual language influence the awareness of speakers by prohibiting or making mandatory the use of special terms and phrases or through the government regulation of language use. In general, imposing such measures requires extensive political power and can be done more easily in totalitarian political systems. The homogenization of language use in terms of regulating specific vocabularies and prohibiting specific modes of expression under the NS regime offers illustrative examples: the absurd racist categorization of people as 'Jews,' 'half-Jewish,' and 'quarter-Jewish' to prepare and justify the Holocaust; the use of cynical euphemisms like 'Crystal Night' for the pogrom of November, 1938; or defining 'Aryanization' as the expropriation of Jewish property organized by the state. These examples show that there is no clear-cut distinction between language and/in politics, on the one hand, and language policies, on the other hand. Another example is the systematic avoidance of the term *assimiljacja* (assimilation) in the former Soviet

Union when describing the phenomenon of switching from a mother tongue (L1) into Russian. The phrase 'transition to the second mother tongue' (*vtoroi rodnoj jazyk*) was used instead, and thus a term with a negative connotation was replaced by one with a positive connotation (see Haarmann, 1987).

However, everyday language also shows that language and politics are two overlapping subjects, which is the focus of this article. Such terms and phrases as 'to make redundant,' 'Social Security scroungers,' 'economic migrants,' 'free-market economy,' and 'pay agreement adjustment' convey a specific approach to reality and are partly consciously created for this purpose. This also applies to word coining aimed at political correctness (Negro-black-nonwhite-colored-African-American, as well as 'ebonics' for the speech and language of African-American people). An important issue in this context is gender-neutral wording, which affects not only the vocabulary but also the morphology of a language (e.g., by inserting in German nouns a capital 'I' and adding a female ending; e.g. Arbeiter Innen '(wo) men workers').

Language policies pursued to reduce the impact of English on other languages are a recent development. In some countries, such as France and Poland, legislation has been adopted to prevent the spread of Anglicisms. In France, the "Act on the Use of the French Language" was passed in 1994 (Loi Toubon, Act No. 669/94 of August 1994), making the use of Anglicisms in specific contexts – at least theoretically – a punishable offense. A terminology committee at the ministerial level prepared proposals for replacing Anglicisms by words of French origin (e.g., *remue m n nges* for brainstorming; *restovite* for fast food, or *bande promo* for video clip) and compiled a glossary with about 3000 terms. This measure of language planning also comes under the heading 'language and politics.' In Poland a law similar to that in France was passed in 1999; the 'Act on the Polish Language' stipulated that all names of goods and services have to be in Polish. This measure can be classified as 'status planning.' The reasons given for adopting this law were the great importance of the Polish language for the national identity and the prevention *inter alia* of the 'vulgarization' of the Polish language, as the English version of this Act reads.

A second important aspect of language policies is concerned with the status and social function of languages. This area covers such issues as the social role and significance of languages or varieties of languages, language conflicts, language and identity, measures to grant specific languages used in a state, the status of an official language in the national territory, and measures to promote languages as languages of communication and foreign languages at the international level. Two different aspects of the social

function of languages have to be distinguished: (1) issues regarding language policy theory and language planning (language politics), and (2) issues concerning the concrete implementation of language policy measures adopted more or less consciously (language policies).

At the national level, governments may enact language policy and language planning measures, as well as legislation concerning the role and status of languages spoken by the inhabitants of the state (i.e., all measures concerning the standardization, use, and active promotion of these languages within and also outside the territory of the state). Even if no consciously planned measures are undertaken and if these phenomena are ignored or rejected, this *laissez-faire* policy can be classified as a language policy. Important questions relating to the status of languages include the following: Which language fulfills the function of a national language and of an official language used as a means of communication between the state and its citizens, which languages are used as languages of instruction, and which languages are taught as foreign languages?

International language policy is influenced by the status and the significance of different languages as a means of supranational and international communication; for example, as a supraregional or global language of communication or as official and working languages in international organizations, such as the UN, the Council of Europe, or NATO and in federations of states like the EU or the former USSR. Important questions in this area include the selection and use of language/s in negotiations between two or more states and the language/s of diplomacy, or of international agreements and treaties (authentic versions). Important issues in the arena of international language policy include phenomena of linguistic imperialism, the increasingly dominant role of English as an international *lingua franca*, models of supranational communication within the EU at the European level, linguistic phenomena in the wake of European labor migration, and the emergence of new allochthonous linguistic minorities in countries experiencing large waves of migration.

In the context of immigration and in connection with the increasing deconstruction of national states, with their dwindling influence on language policy, a change of paradigms in the perception of language and the state, and also language and the individual, has taken place in sociolinguistics. Individual multilingualism and social plurilingualism are now considered the standard – “monolingualism is curable,” as the editors of the journal *Sociolinguistica* (Ammon *et al.*, 1997) put it. Foreign language policy (which languages are taught to what extent in

which countries?) as well as measures to promote the use of languages through foreign cultural policies and cultural institutes (e.g., the British Council, *Institut Français*, *Goethe Institut*, *Istituto Cervantes*) play a crucial role in international language policy.

Discourse/Text/Politics

In this section, we first define relevant concepts and terms used in research on language and politics, then pull together the most important characteristics of significantly different approaches, and finally present some of their most important findings and studies.

Research in the field of language and politics has expanded enormously in recent years (Fairclough, 1992; Blommaert and Verschueren, 1998; Reisigl and Wodak, 2001; Wodak, 2001a; Wodak, 2001b; Gruber *et al.*, 2003; Chilton, 2004). According to the underlying specific theoretical approach, the notion of discourse is defined in many different ways. Since the 1970s and 1980s, this notion has been subject to manifold semantic interpretations. These vague meanings have become part of everyday language use, a fact highlighted *inter alia* by Ehlich (2000), who also presented specific definitions of discourse that were linked to the British, French, and German research traditions. For example, in British research, the term ‘discourse’ is often used synonymously with the term ‘text’ (i.e., meaning authentic, everyday linguistic communication). The French *discours*, however, focuses more on the connection between language and thought; that is, the “creation and societal maintenance of complex knowledge systems” (Ehlich, 2000: 162). In German pragmatics, *Diskurs* denotes “structured sets of speech acts.” Other possible definitions range from a “promiscuous use of ‘text’ and ‘discourse’” (Ehlich, 2000), as found predominantly in Anglo-Saxon approaches, to a strict definition from the perspective of linguistic pragmatics (see Titscher *et al.*, 2000).

We endorse Lemke’s (1995: 7) definition, which distinguishes between text and discourse in the following way:

“When I speak about discourse in general, I will usually mean the social activity of making meanings with language and other symbolic systems in some particular kind of situation or setting. . . . On each occasion when the particular meanings, characteristic of these discourses are being made, a specific text is produced. Discourses, as social actions more or less governed by social habits, produce texts that will in some ways be alike in their meanings. . . . When we want to focus on the specifics of an event or occasion, we speak of the text; when we want to look at patterns, commonality, relationships that embrace different texts and occasions, we can speak of discourses.”

The notion of politics is also defined in many different ways depending on the theoretical framework: It ranges from a wide extension of the concept according to which every social utterance or practice of the human as a *zoon politikon* is 'political' to a notion of politics referring only to the use of language by politicians in various settings and in political institutions:

"On the one hand, politics is viewed as a struggle for power, between those who seek to assert their power and those, who seek to resist it. On the other hand, politics is viewed as cooperation, as the practices and institutions that a society has for resolving clashes of interest over money, influence, liberty, and the like" (Chilton, 2004: 3).

Chilton (2004) embraced an interactive view of politics, which cuts through both these dimensions mentioned above. This is also the perspective endorsed in this article.

Furthermore, it is important to define the political domains and the genres that are relevant in this field (in the sense of Bourdieu's theory of fields, habitus, and capitals). The most important domains are summarized in Figure 1.

The triangulatory discourse–historical approach is based on a concept of context that takes into account four levels; the first one is descriptive, whereas the other three levels are part of theories dealing with context (see Figure 2);

1. the immediate, language or text internal cotext
2. the intertextual and interdiscursive relationship among utterances, texts, genres, and discourses
3. the extralinguistic social/sociological variables and institutional frames of a specific 'context of situation' (Middle Range Theories)
4. the broader sociopolitical and historical contexts, in which the discursive practices are embedded and related.

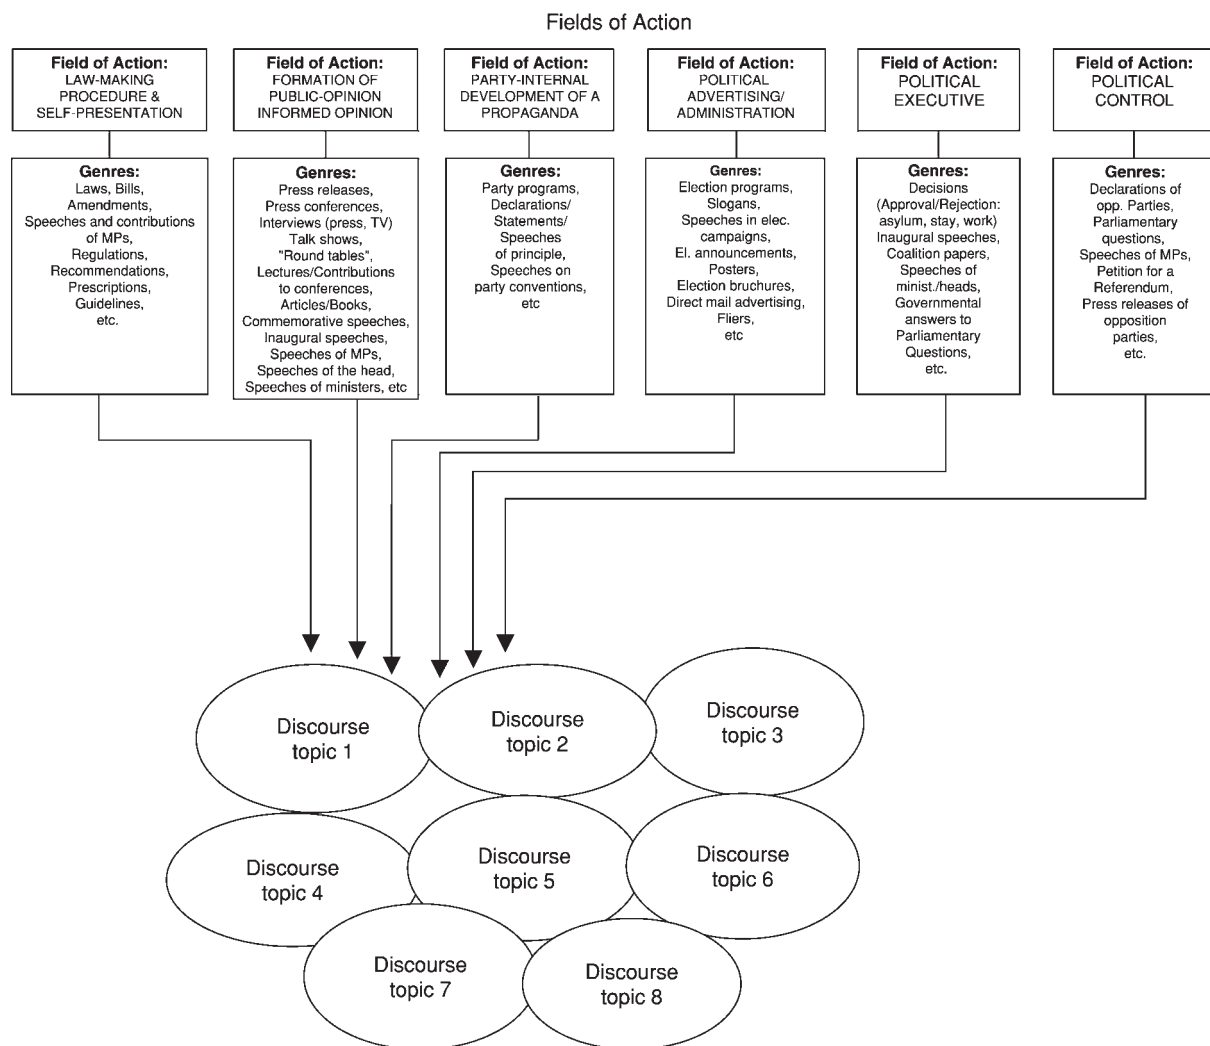

Figure 1 Selected dimensions of discourse as social practice. (From Reisigl and Wodak, 2001: 38).

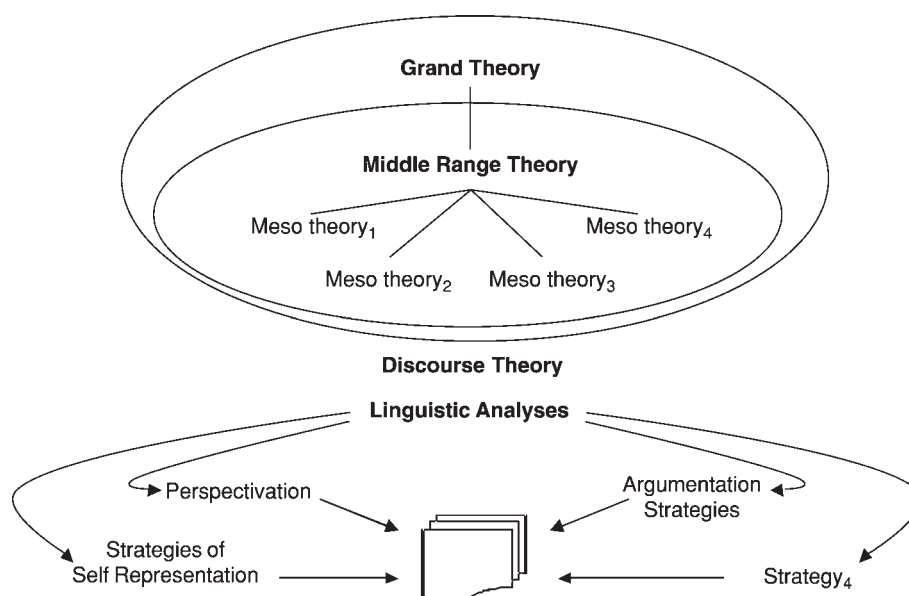

Figure 2 Levels of theories and linguistic analysis. (From Wodak and Meyer, 2001: 69).

The most salient feature of the definition of a discourse is the macrotopic, such as language policies. Interdiscursivity can be detected when, for example, an argument (taken from the discourse on immigration restrictions) is used while arguing for other policies to combat unemployment. Each macrotopic allows for many subtopics: Unemployment thus covers such subtopics as market, trade unions, social welfare, global market, hire and fire policies, and many more. Discourses are not closed systems at all; rather, they are open and hybrid. New subtopics can be created, and intertextuality and interdiscursivity allow for new fields of action and new genres. Discourses are realized in both genres and texts (*see Genres in Political Discourse*).

Inter/Trans/Multidisciplinarity

Research on language and/in politics is primarily inter- or transdisciplinary. The concepts ‘theory’ and ‘interdisciplinarity’ refer to the conceptual and disciplinary framework conditions of discourse-analytical research. Discourse analysis has concentrated on the process of theory formation and has emphasized the interdisciplinary nature of its research since its beginning (Weiss and Wodak, 2003). The plurality of theory and methodology can be highlighted as a specific strength of the research summarized in this overview. Chouliaraki and Fairclough (1999: 16) described the eclectic nature of critical discourse analysis (CDA) as follows:

“We see CDA as bringing a variety of theories into dialogue, especially social theories on the one hand and linguistic theories on the other, so that its theory is

a shifting synthesis of other theories, though what it itself theorizes in particular is the mediation between the social and the linguistic – the ‘order of discourse,’ the social structuring of semiotic hybridity (interdiscursivity). The theoretical constructions of discourse which CDA tries to operationalize can come from various disciplines, and the concept of ‘operationalization’ entails working in a transdisciplinary way where the logic of one discipline (for example, sociology) can be ‘put to work’ in the development of another (for example, linguistics).”

This statement underlines the direct connection between theory and interdisciplinarity or transdisciplinarity that is typical of discourse analysis.

The sociologist Helga Nowotny (1997: 188) outlined the concepts of inter/trans/pluri-disciplinarity briefly and very accurately:

“Pluri(multi-)disciplinarity shows in the fact that the manifold disciplines remain independent. No changes are brought about in the existing structures of disciplines and theories. This form of academic cooperation consists in treating a subject from differing disciplinary perspectives. Interdisciplinarity may be recognized in the explicit formulation of a standardized transdisciplinary terminology. This form of cooperation is used to treat different subjects within a framework of an interdisciplinary or transdisciplinary design. Transdisciplinarity manifests itself when research across the disciplinary landscape is based on a common axiomatic theory and the interpenetration of disciplinary research methods. Cooperation leads to a bundling or clustering of problem-solving approaches rooted in different disciplines and drawing on a pool of theories.”

Current Research in Language and Politics

Some Research Dimensions

Having reviewed the relevant theoretical concepts and studies, we present here a summary of the important research issues:

- How widely or narrowly should political action (or political language behavior) be defined? Should it be restricted to the study of traditional political genres (like speeches, slogans, debates), or are all everyday actions in some way ‘political’?
- What is the role of the political elites? Who determines political issues? Is it thus important to investigate the media; the rhetoric of politicians, teachers, and scholars, as well as managers; or the language used by ‘men and women on the street’ and their respective belief systems? This question leads to the debate about possible causalities: whether it is top down or bottom up. Do people believe what the politicians (media) tell them, or do the citizens influence the slogans in an election campaign? What about grassroots movements?
- Politics is tied to ideologies, party programs, opinion leaders, and political interests. How do ideologies and belief systems manifest themselves in various genres of political discourse? How are *topoi* and arguments recontextualized through various genres and public spaces? (see **Rhetorical Tropes in Political Discourse**).
- What are the main functions of political discourses? To answer this question, we have to examine strategies of persuasion, negotiation, polarization, etc. On the one hand, politics serves to find consensus and compromises and to make decisions. On the other hand, politics leads to wars and conflicts (see **Metaphors in Political Discourse**). How do power structures influence decision-making strategies?
- Finally, what are the main settings where political practices take place (‘doing politics’)? How do the structures of various organizations and institutions influence political discourses?

There are certainly many more related questions, such as the influence of globalizing processes on language change or changes in political rhetoric and its functions over time (see Kovács and Wodak, 2003).

Critical Linguistics and Critical Discourse Analysis and the Analysis of Political Discourses

The terms ‘Critical Linguistics’ (CL) and ‘Critical Discourse Analysis’ (CDA) are often used interchangeably.

CL developed in the 1970s and 1980s, primarily at the University of East Anglia, around the work of Roger Fowler, Tony Trew, and Gunther Kress. In more recent research, it seems that the term CDA is preferred and is used to denote the theory formerly identified as CL. CDA sees “language as social practice” (Fairclough and Wodak, 1997) and considers the context of language use to be crucial (Weiss and Wodak, 2003; Wodak and Weiss, 2004). Moreover, CDA takes a particular interest in the relation between language and power. CDA research specifically considers institutional, political, gender, and media discourses (in the broadest sense) that testify to more or less overt relations of struggle and conflict (see **Critical Discourse Analysis**).

The shared perspective of CL and CDA relates to the term ‘critical,’ which in the work of some ‘critical linguists’ could be traced to the influence of the Frankfurt School or of Jürgen Habermas. The continuity between CL and CDA is visible mostly in the claim that discourses are ideological and that there is no arbitrariness of signs. Functional-systemic linguistics has proven to be most important for the text analysis undertaken by CL (see Halliday, 1978).

CL and CDA are rooted in classical rhetoric, text linguistics, and sociolinguistics, as well as in applied linguistics and pragmatics. The objects under investigation by the various departments and scholars who apply CDA differ, although gender issues, issues of racism, media discourses, the rise of right-wing populism, and dimensions of identity politics have become very prominent (see **Media, Politics and Discourse Interactions; Gender and Political Discourse; Newspeak**). The methodologies used also differ greatly: Small qualitative case studies can be found, as well as large data corpora, drawn from fieldwork and ethnographic research.

CL and CDA may be defined as fundamentally interested in analyzing both opaque and transparent structural relationships of dominance, discrimination, power, and control as manifested in language. Four concepts figure indispensably in all CDA work: the concepts of critique, power; history; and ideology (see **Gender and Political Discourse**).

The notion of critique carries very different meanings: Some adhere to the Frankfurt School and others to a notion of literary criticism or to Marx’s notions (see Reisigl and Wodak, 2001 for an overview). Ideology is seen as an important aspect of establishing and maintaining unequal power relations. For Eagleton (1994), the study of ideology must consider the variety of theories and theorists who have examined the relation between thought and social reality. All these theories assume “that there are specific historical reasons why people come to feel, reason, desire and imagine as they do” (Eagleton, 1994: 15).

For CDA, language is not powerful on its own: Rather, it gains power by the use powerful people make of it. Thus, CDA focuses on processes of inclusion and exclusion, of access to relevant domains of our societies. Moreover, CDA emphasizes the need for interdisciplinary work in order to gain a proper understanding of how language functions in, for example, constituting and transmitting knowledge, organizing social institutions, or exercising power.

Texts are seen as sites of struggle in that they show traces of differing discourses and ideologies ('voices' in the Bakhtinian sense), contending and struggling for dominance. Not only the struggles for power and control but also the intertextuality and recontextualization of competing discourses are closely attended to in CDA.

Different Theoretical Approaches Concerning Discourse and Politics

Fairclough set out the social theories underpinning CDA, and as in other early critical linguistic work, a variety of textual examples are analyzed to illustrate the field, its aims, and methods of analysis. Chouliaraki and Fairclough (1999) showed not only how the analytical framework for investigating language in relation to power and ideology developed but also how CDA is useful in disclosing the discursive nature of much contemporary social and cultural change. They particularly scrutinized the language of the mass media as a site of power and of struggle and also where language is apparently transparent. Media institutions often purport to be neutral in that they provide space for public discourse, they reflect states of affairs disinterestedly, and they give the perceptions and arguments of the newsmakers. Fairclough showed the fallacy of such assumptions by illustrating the mediating and constructing role of the media with a variety of examples.

van Dijk and Kintsch (1983) considered the relevance of discourse to the study of cognitive language processing. Their development of a cognitive model of discourse comprehension gradually developed into cognitive models for explaining the construction of meaning on a societal level. The notion of 'strategy' proved to be fruitful for a number of studies on language and politics (see below).

In critically analyzing various kinds of discourses that encode prejudice, van Dijk was interested in developing a theoretical model that explained cognitive discourse processing mechanisms related to the production and reproduction of racism. Most recently, van Dijk (2004) has focused on elaborating models of context and knowledge.

The Duisburg School of CDA draws on Foucault's notion of discourse, on the one hand, and Alexej N.

Leont'ev's "speech activity theory" (Leontjew, 1984) and Jürgen Link's "collective symbolism" (Link, 1988), on the other hand. As institutionalized and conventionalized speech modes, discourses express societal power relations, which in turn are affected by discourses. This 'overall discourse' of society, which could be visualized as a "*diskursive Gewimmel*" (literally, discursive swarming), becomes manifest in different 'discourse strands' (comprising discourse fragments of the same subject) at different discourse levels (science, politics, media, etc.). Every discourse is historically embedded and has repercussions on current and future discourse. In addition to the above levels, the structure of discourse may be dissected into special discourse vs. inter-discourse; discursive events and discursive context; discourse position; overall societal discourse and interwoven discourses; themes and bundles of discourse strands; and the history, present, and future of discourse strands. These fragments are analyzed in five steps – institutional framework, text 'surface,' linguistic–rhetoric means, programmatic-ideological messages, and interpretation – for which concrete questions regarding the text are formulated.

For example, the discourse of the so-called New Right in Germany was analyzed by Jäger and Jäger (1993), who based their research on different right-wing print media. They identified important common characteristics – specific symbols, 'ethnopluralism' [apartheid], aggressiveness, and antidemocratic attitudes – as well as significant linguistic and stylistic differences relating to the different target groups of the newspapers.

The combination of political science and political philosophy (predominantly with a strong Marxist influence) and of French linguistics is typical of French discourse analysis. Essentially, two different approaches may be distinguished.

The first is 'political lexicometry,' a computer-aided statistical approach to political lexicon developed at the Ecole Normale Supérieure at Saint-Cloud. A text corpus (e.g., texts of the French Communist Party) is prepared. Texts are then compared on the basis of the relative frequency of specific words. One study shows, for example, how the relative frequency of the words '*travailleur*' and '*salarié*' varies significantly among French trade unions, reflecting different political ideologies; it also shows how that frequency changes over time (Groupe de Saint-Cloud, 1982).

Althusser's theory on ideology and Foucault's theory were major points of reference for the second approach in French discourse analysis, notably the work of Michel Pêcheux (1982). Discourse is the place where language and ideology meet, and discourse analysis is the analysis of ideological dimensions of

language use and of the materialization in language of ideology. Both the words used and the meanings of words vary according to the position in the class struggle from which they are used; in other words, according to the 'discursive formation' within which they are located. For instance, the word 'struggle' itself is particularly associated with a working class political voice, and its meaning in that discursive formation is different from its meanings when used from other positions.

Pêcheux's main focus was political discourse in France, especially the relationship between social-democratic and Communist discourses within left political discourse. He emphasized the ideological effects of discursive formations in positioning people as social subjects. Echoing Althusser, he suggested that people are placed in the 'imaginary' position of being sources of their discourse, whereas actually their discourse and indeed they themselves are the effects of their ideological positioning. The sources and processes of their own positioning are hidden from people, who are typically not aware of speaking/writing from within a particular discursive formation. Moreover, the discursive formations within which people are positioned are themselves shaped by the 'complex whole in dominance' of discursive formations, which Pêcheux called 'interdiscourse'; however, people are not aware of that shaping. Radical change in the way people are positioned in discourse can only come from political revolution.

In the 1980s, the influence of Michel Foucault increased, as did that of Mikhael Bakhtin. Studies began to emphasize the complex mixing of discursive formations in texts and the heterogeneity and ambivalence of texts (for example, see Courtine, 1981).

An increased recognition of the contribution of all aspects of the communicative context to text meaning, as well as a growing awareness in media studies of the importance of nonverbal aspects of texts, has focused attention on semiotic devices in discourse other than linguistic ones. In particular, the theory put forward by Kress and van Leeuwen (1996) provided a useful framework for considering the communicative potential of visual devices in the media. This research is closely related to the role and status of semiotic practices in society, which is currently undergoing change because, increasingly, global corporations and semiotic technologies, rather than national institutions, are regulating semiotic production and consumption.

This emphasis on regulatory practices has led to a three-stage research approach, starting with the analysis of a particular category of texts, cultural artifacts, or communicative events; then moving to a second set of texts (and/or cultural artifacts and/or

communicative events) – namely those that seek to regulate the production and consumption of the first set; and finally moving to a third set of texts, namely actual instances of producing or consuming texts (etc.) belonging to the first set. This type of work creates a particular relation among discourse analysis, ethnography, history, and theory in which these disciplines are no longer contributing to the whole through some kind of indefinable synergy or triangulation, but are complementary in quite specific ways.

In the last few years, Jay Lemke's work has emphasized multimedia semiotics, multiple timescales, and hypertexts/traversals. He extended his earlier work on embedded ideologies in social communication from an analysis of verbal texts to an integration of verbal texts with visual images and other presentational media, with a particular focus on evaluative meanings. His work has emphasized the implicit value systems and their connections to institutional and personal identity. In all this work, Lemke uses critical social semiotics as an extension of critical discourse analysis, combined with models of the material base of emergent social phenomena. His concern is with social and cultural change: how it happens, how it is unconstrained, and the ways in which it is expectably unpredictable (Lemke, 1995).

Lemke's latest work has developed the idea that, although we tell our lives as narratives, we experience them as hypertexts. Building on research on the semantic resources of hypertext as a medium, he proposed that postmodern lifestyles are increasingly liberated from particular institutional roles and that we tend to move, on multiple timescales, from involvement in one institution to another; we create new kinds of meaning, being less bound to fixed genres and registers, as we 'surf' across channels, websites, and lived experiences. This lifestyle is seen as a new historical development that does not supplant institutions, but rather builds up new socio-cultural possibilities on top and over them. These new lifestyles imply new forms of participation in politics as well as in the media.

The problem that Ron and Suzie Wong Scollon address in their recent work is how to build a formal theoretical and a practical link between discourse and action. Theirs is an activist position that uses tools and strategies of engaged discourse analysis in taking action and thus requires a formal analysis of how its own actions can be accomplished through discourse and its analysis. Ron Scollon's (2001) recent work furthers the idea developed in *Mediated discourse: the nexus of practice* that practice in general is understood most usefully as many separate practices that are linked in a nexus, an overlap of topical discourses. The relations between discourse and a nexus of

practice are many and complex and rarely direct. His current interest is in trying to open up and explicate these linkages through 'nexus analysis.' The focus of his recent work has been to theorize the link between indexicality in language (and discourse and semiotics more generally) and the indexable in the world. This could also be described as theorizing the link between producers of communications and the material world in which those communications are placed as a necessary element of their semiosis. Ron Scollon is applying this model of analysis to the 'discursive politics of food production and to the discourses of environmental politics.'

The study in which the discourse-historical approach was actually first developed tried to trace in detail the constitution of an anti-Semitic stereotyped

image or '*Feindbild*,' as it emerged in public discourse in the 1986 Austrian presidential campaign of Kurt Waldheim (Wodak *et al.*, 1990). The discourse about the Waldheim Affair spread to different fields of political action, involving many different genres and topics. **Figure 3** illustrates in simplified terms the discourse and the most relevant relationships among fields of action, genres, and discourse topics.

To illustrate this context-dependent approach, we present some of the many layers of discourse investigated in the study of the Waldheim Affair. During the 1986 election, Waldheim had at first denied active involvement with Nazism and Nazi military operations in the Balkans.

To contradict his assertion, there were documents of the *Wehrmacht* about the war in the Balkans in

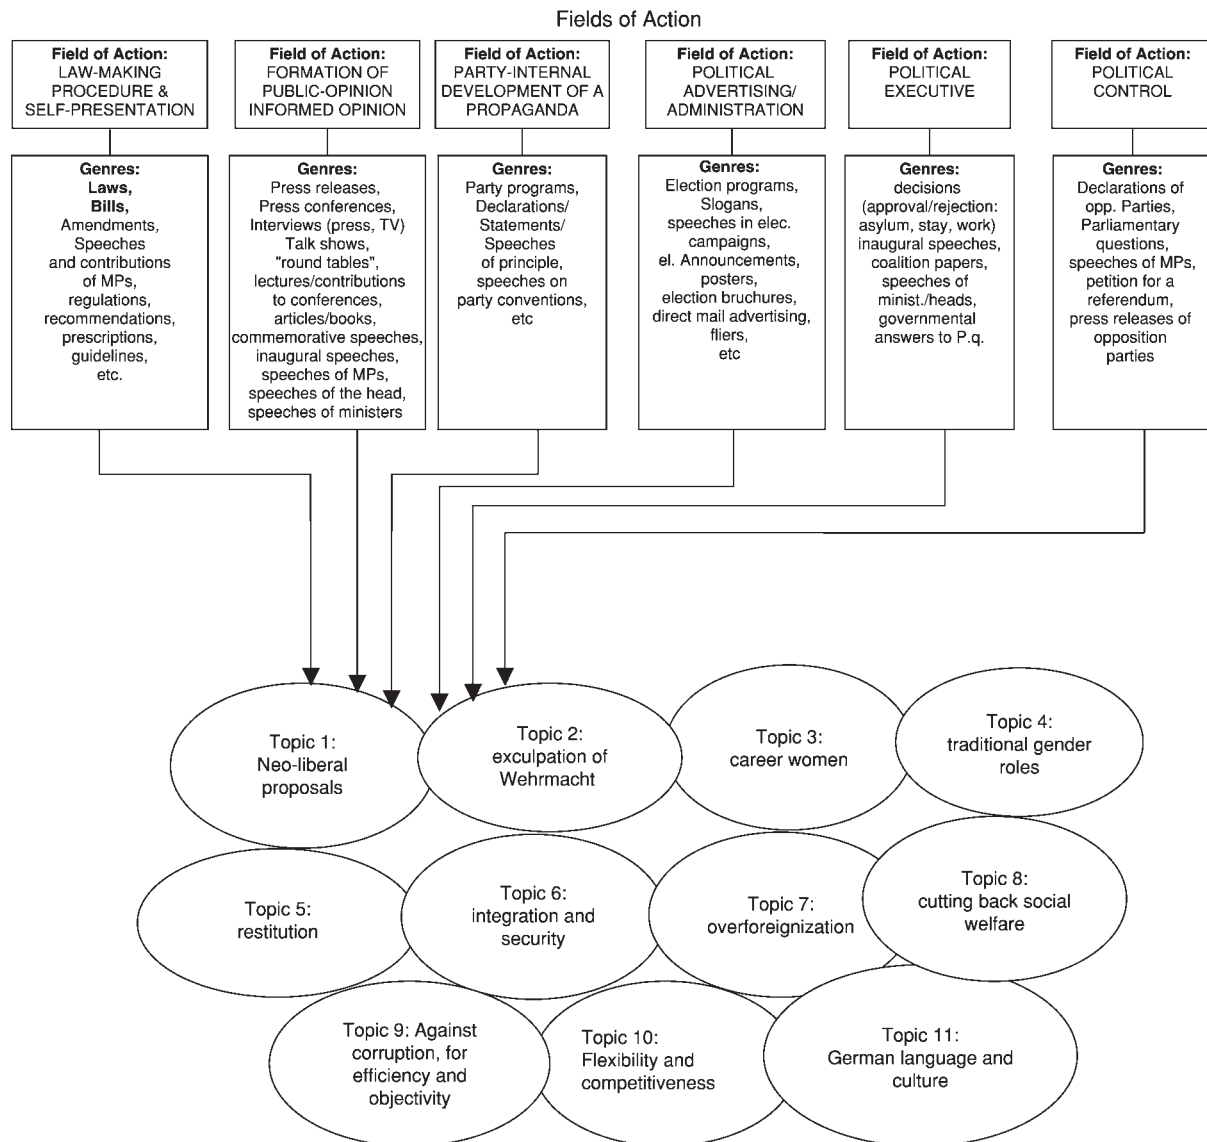

Figure 3 The discourse about the Waldheim Affair. (From Wodak, 2004: 192).

general, as well as documents relating specifically to Waldheim's activities there. There were also several statements and interviews with *Wehrmacht* veterans who had served with Waldheim. One step removed from these materials was the research by historians on the Balkan war in general and on Waldheim's war-time role in particular. At still another level there was the reporting in Austrian newspapers on the Balkan war, on Waldheim's past, and on historical research into the war and Waldheim's role in it. There were reports in newspapers on Waldheim's own explanation of his past; in addition, all these previously mentioned aspects were reported in foreign newspapers, especially in *The New York Times*. Simultaneously, the press releases and documents of the World Jewish Congress provided an autonomous informational and discursive source. Finally, there were statements of and interviews with politicians, as well as the '*vox populi*,' on all these topics.

Though sometimes tedious and very time consuming, such a discourse–historical approach allowed us to record the varying perceptions, selections, and distortions of information. As a result, we were able to trace in detail the constitution of an anti-Semitic stereotyped image or '*Feindbild*' of 'the others' as it emerged in public discourse in Austria in 1986.

The discourse–historical approach has been elaborated further in several more recent studies; for example, in studies on right-wing populist rhetoric, as developed by Jörg Haider and the Freedom Party in Austria on discourses about coming to terms with traumatic pasts; and on the discursive construction of national and European Identities (Wodak *et al.*, 1999; Martin and Wodak, 2003; Wodak and Weiss, 2004). Particularly, the mediation between context and text has been elaborated further (see Figure 2).

Questions of identity politics are becoming increasingly important in societies full of tensions between globalizing processes and nationalistic trends (who is included and who is excluded). Five questions have proven to be relevant for new theoretical and methodological approaches:

1. How are persons named and referred to linguistically?
2. What traits, characteristics, qualities, and features are attributed to them?
3. By means of what arguments and argumentation schemes do specific persons or social groups try to justify and legitimize the inclusion/exclusion of others?
4. From what perspective or point of view are these labels, attributions, and arguments expressed?
5. Are the respective utterances articulated overtly, are they even intensified, or are they mitigated?

To answer these questions, we are especially interested in five types of discursive strategies, which are all involved in the positive self- and negative other-presentation. We view, and this needs to be emphasized, the discursive construction of 'US' and 'THEM' as the basic fundamentals of discourses of identity and difference.

By 'strategy' we generally mean a more or less accurate and more or less intentional plan of practices (including discursive practices), adopted to achieve a particular social, political, psychological, or linguistic aim. We locate the discursive strategies – that is to say, systematic ways of using language – at different levels of linguistic organization and complexity (see Table 1).

For example, when analyzing patterns of exclusion/inclusion, we have to demonstrate how certain

Table 1 Discursive strategies for positive self- and negative other-representation

Strategy	Objectives	Devices
Referential/nomination	Construction of in-groups and out-groups	Membership categorization Biological, naturalizing and depersonalizing Metaphors and metonymies Synecdoches (<i>pars pro toto</i> , <i>totum pro pars</i>)
Predication	Labeling social actors more or less positively or negatively, deprecatorily or appreciatively	Stereotypical, evaluative attributions of negative or positive traits Implicit and explicit predicates
Argumentation	Justification of positive or negative attributions	<i>Topoi</i> used to justify political inclusion or exclusion, discrimination or preferential treatment
Perspectivation, framing, or discourse representation	Expressing involvement Positioning speaker's point of view	Reporting, description, narration, or quotation of events and utterances
Intensification, mitigation	Modifying the epistemic status of a proposition	Intensifying or mitigating the illocutionary force of utterances

From Wodak (2001b: 73).

utterances realized through linguistic devices point to extralinguistic contexts, diachronically and synchronically. Moreover, the strategies for positive self- and negative other-presentation are systematically used in constructing discourses on identity and discrimination at all levels of group formation (local, regional, national, transnational, and global).

Perspectives

Questions of identity politics are always tied to issues of difference and discrimination, as well as globalizing and localizing processes. On the one hand, we observe enormous complexity; on the other hand, we see tendencies to simplify through dichotomizing strategies. Rightwing populist discourses employ *inter alia* such simplifying strategies. Ongoing research is taking these tensions, contradictions, and new tendencies into account.

Introduction

This article examines the role of politics in applied linguistics and second language teaching. It begins with the traditional, mainstream understanding of the interface between politics and applied linguistics, i.e., language policy and planning, and moves from there to the rise since the 1990s of an alternative view of that interface, i.e., critical applied linguistics. The characteristics and positions of critical applied linguistics are outlined, and the major domains of applied linguistics such as international English and English for academic purposes are discussed from the perspectives of both mainstream and critical applied linguistics.

The Politics of Mainstream Applied Linguistics

Language Policy and Planning

The branch of mainstream applied linguistics inextricably tied to politics and sociopolitical relations is language policy and planning (LPP). Indeed, as Kaplan and Baldauf pointed out, LPP may be considered the *ne plus ultra* of applied linguistics in society, or, as they put it, "linguistics applied" (1997: 307),

and Kaplan has advocated an active role for applied linguists in the sociopolitical processes of LPP (2001: 9). Possible methods of political activism include forming interest groups, attending and participating in meetings of the board of education and/or the state assembly, writing position papers, serving as professional consultants, and working to inform and affect public opinion about language-based issues, e.g., through letters to the editor or websites – in short, utilizing whatever mechanisms for influence and change that one's political system provides.

LPP deals with issues of language decision making, implementation, and evaluation at every level of society, from local to national, and these issues are always directly or indirectly political. They are directly political when local, state, or federal governments engage in formal debate and legislation in an attempt to mediate or resolve questions of language in society. But even when governments do not become formally involved in language policy, opting instead for a *laissez-faire* approach, language issues are nonetheless indirectly political because they affect the lives of individuals and groups in all but the most linguistically homogeneous societies. In addition, it may be said that government nonintervention in matters of language is itself a language policy, though a tacit rather than a formal one, and, generally speaking, as societies with histories of governmental nonintervention become increasingly heterogeneous

and/or find linguistic minority groups challenging the tacit language policy, governments will feel compelled by public pressure to deal directly with matters of language policy. This has been the case in the United States, which on one hand has no formal language policy at the federal level, but on the other hand has seen local and state governments legislate English as the official language.

A look at some of the typical questions asked in LPP clearly shows their inherent sociopolitical and socioeconomic nature, involving, as they do, crucial matters of national identity, linguistic advantage, educational opportunity, social relations, political participation, and fiscal resources:

1. What is/are/should be the national and/or official language(s) of the society?
2. What is/should be the role of minority language(s)?
3. Which language(s) should be taught in schools, e.g., the national/official language only? the native language(s) of linguistic minority groups? a language of international communication, e.g., English, Spanish, French?
4. What are/should be the goals of minority and foreign language instruction, e.g., equality of status between the majority and minority languages of the society? oral communicative competence in a foreign language or literacy proficiency only?
5. When does/should instruction in the minority and foreign languages begin, how much time during the school day is/should be devoted to language instruction, and how many years does/should it continue?
6. Are there sufficient numbers of trained teachers proficient in the languages of instruction to carry out the mandated policies? What are the plans and procedures for producing trained teachers?

Researchers employ a variety of techniques to investigate questions such as these, and despite the multidisciplinary nature of LPP, which draws from fields with their own research traditions and trends, e.g., anthropology, economics, education, political science, and sociolinguistics, we can identify some of the most common LPP research methodologies (Kaplan and Baldauf, 1997; Baldauf, 2002):

1. Quantitative studies in the form of surveys and questionnaires in order to determine as accurately as possible the number of languages and dialects spoken in the society, and by how many people each one is spoken.
2. Discourse analyses of the uses and patterns of communication in the various linguistic communities, including patterns of literacy as well as

speech. Discourse studies help to inform language-in-education planning for both linguistic majority and minority groups (Hornberger, 1995).

3. Historical analyses of the development, roles, and relationships of the languages in the society, since history and historical memories have a significant effect on the success or failure of LPP, e.g., Aboriginal languages *vis-à-vis* English in Australia.
4. Quantitative and qualitative studies of language attitudes among groups in the society. Attitudes need to be taken into account, particularly in language-in-education planning, in order to understand, for example, the hopes and desires of linguistic minority parents for their children, e.g., whether they want their children to be educated bilingually, or in the national/official/ dominant language of the society, and/or in a language of wider communication, such as English.
5. Longitudinal studies evaluating the processes and outcomes of LPP and language-in-education planning. Although both ideal and necessary, long-term evaluative studies in all areas of applied linguistics, including LPP, tend to be scarce. Only with the aid of longitudinal empirical studies, however, can adjustments and improvements in policy and planning be made.

To illustrate the complex sociopolitical, socioeconomic, and sociocultural realities of LPP, the language situation of the southeast African country of Mozambique will be described in brief in the next section.

Mozambique An independent country since 1975 after nearly five centuries as a Portuguese colony, Mozambique is a highly linguistically diverse nation, with 39 languages listed in the 2004 online database of *Ethnologue: languages of the world*. Almost all are Bantu languages, but the total also includes Portuguese, Chinese, and languages of India and Pakistan. No language is spoken by a majority of the population of over 16 million.

When Mozambique became independent in 1975, Portuguese continued as the *de facto* official language, since it was already the language of government and administration from colonial history. Only in the 1990 revised version of the constitution, however, was Portuguese formally declared the official language, not only because it was already unofficially in place in that capacity but because of its perceived national unifying effect on this highly multilingual nation ravaged by 16 years of civil war. Native speakers of Portuguese constitute approximately 3% of the population, and an estimated 40% speak and understand

the language at varying levels of proficiency, a percentage corresponding to the estimated literacy rate. Portuguese is the language of instruction in the public school system, with English introduced as a required foreign language at the secondary level, and French offered at the secondary level only for certain specified university majors in the humanities and social sciences.

The rewriting of the constitution in 1990 also represented a significant turning point in the official language policy of Mozambique in that for the first time the issue of the country's indigenous languages was directly addressed: "The State shall value the national languages and promote their development and their growing usage as vehicular languages and in the education of citizens" (Lopes, 1999: 104). It is doubtful whether this clause would have been included had it not been for the ongoing debates and discussions about Mozambican languages in relation to Portuguese that took place in the Ministry of Education and the Office of the Secretary of State for Culture in the 1970s and 1980s. In addition, efforts by language professionals and others committed to the recognition of indigenous languages led to a conference in 1988 called the 1st Seminar on the Standardization of Orthography of Mozambican Languages, with a report of the meeting published the following year, and the subsequent influence on the writers of the revised constitution a year after that.

The wording of the clause in the constitution suggested two courses of action: (1) the development of the indigenous languages of Mozambique in the direction of literacy, e.g., vocabulary expansion, grammar usage, standardized spelling, etc.; and (2) the development and implementation of bilingual education programs to give all language groups in the society equality of opportunity. Both implications also pointed to the need for the services of linguists and applied linguists trained in methodology, materials development, and language-in-education planning.

However, the reality of the language situation in Mozambique has presented difficulties to this day in carrying out the goals expressed in the statement of the revised constitution. According to Lopes (1999), parents of school-age children want Portuguese and English proficiency for their children, not their native Bantu languages, for they see Portuguese and English as means to upward mobility; thus, "consciousness raising and improvement of attitudes toward indigenous languages" (Lopes, 1999: 100) need to take place before bilingual education programs can be successfully implemented. In addition, Mozambique already suffers from a shortage of qualified teachers in the present Portuguese-based system, which raises a formidable obstacle, both in terms of human and fiscal

resources, for the training of bilingual teachers in the indigenous languages of the country. Despite the difficulties, however, five bilingual education programs at the primary level were developed in the 1990s, as well as an adult literacy bilingual program for women. Both projects have drawn on the expertise of linguists and applied linguists for materials development and methodology, and while it is still too early to judge the outcomes of these programs, it is an encouraging sign that the indigenous languages and peoples of Mozambique are beginning to receive the official recognition and attention they deserve.

The Politics of Critical Applied Linguistics

Critical Theory

Critical applied linguistics is an alternative, oppositional approach to mainstream applied linguistics. It derives its name from critical theory, the umbrella term for the neo-Marxist-based work that originated in the 1930s at what has come to be known as the Frankfurt school, i.e., the Institute for Social Research at the University of Frankfurt, Germany. The members of the Frankfurt school themselves called their mix of theory, research, and philosophy 'critical theory,' for their intent was to critically analyze capitalist society, culture, and Western civilization, and to find ways of making a revised form of Marxism viable. The contemporary influence of the Frankfurt school reached its height in the 1960s and early 1970s, for example with the writings of Habermas (1972), and then the focus of attention in critical theory shifted to the work of French intellectuals, such as Foucault (1980) and Bourdieu (1991).

As an umbrella term, critical theory encompasses a broad range of concepts in areas such as linguistics, philosophy, literary theory, cultural studies, legal studies, and gender studies. Despite its diversity, however, we can identify some common core words and tenets borrowed from the vocabulary of Marxism, updated by theories of poststructuralism and postmodernism, reshaped by the realities of global capitalism and postcolonialism, and shared by critical theorists in all disciplines:

1. Ideology and the status quo. Critical theory starts with the assumption that societies are based on ideology, defined as the dominant systems of values, beliefs, attitudes, preferences, and structures (social, political, economic, legal, educational, religious, etc.) in a society. What is often called culture in noncritical perspectives is subsumed under the all-encompassing term 'ideology' in critical theory, and to accept the ideology of one's society is to acquiesce to the *status quo*.

2. Critique. In accordance with its name and origins, critique is the first analytic step in critical theory, the purpose of which is to deconstruct ideology, defined by critical theorists as all foundational principles, assumptions, and models of society.
3. Problematicization, contestation, power, transformation. Critique, which analyzes, leads to problematicization, which questions and challenges, and then to contestation, which resists and opposes. What is always critiqued, problematicized, and contested is power, for power relations in society inevitably mean hierarchy, with social, political, economic, educational, racial, ethnic, or sexual privilege for some and inequality for others. The ultimate goal of critical theory is social transformation, i.e., the elimination of inequality, through the work of “transformative intellectuals” (Aronowitz and Giroux, 1993: 45), and in this, critical applied linguistics is very much an outgrowth of critical theory.
4. Discourse(s). The concept of discourse was brought to the fore by Foucault (1980), and it refers to the construction and organization of systems of knowledge, meaning, and identity. Often used in the plural to reflect their multiplicity and not meant to be limited solely to the system of language, discourses are seen as assigning and mediating social values to all aspects of human interaction, e.g., speech, writing, images, gestures. In addition, according to Foucault (1980), discourses are systems of power and knowledge, which means that not only do we construct discourses but discourses construct us as subjects in dominant or nondominant power positions. Dominant discourses, however, can always be contested, and “the counter-discourse always projects, just over its own horizon, the dream of victoriously replacing its antagonist” (Terdiman, 1985: 56).

Language Policy and Planning

Critical applied linguistics places politics at the center of its framework, but, unlike mainstream LPP, it rejects the traditional meaning of the word ‘politics,’ which is typically understood to be concerned with the activities and affairs of government and its associated institutions. Pennycook made the rejection explicit:

Language policy [is] sometimes taken to represent the political focus of applied linguistics [re] governmental decisions about the use and status of languages. Yet I want to resist this view that politics has to do with policy making or with the more formal domains of politics... (2001: 27)

Instead, politics is generalized to become synonymous with power, a key operative word in critical theory.

This expansion of the concept of politics leads to the assertion found in every critical perspective that everything is political because power, and, with it, inequality, exist in all currently constituted social and institutional relations. Thus, Tollefson (2002: 4), was critical of mainstream LPP, while also acknowledging its widespread acceptance as the norm, for “too often accept[ing] uncritically the claims of state authorities” or, in other words, for not engaging in the problematicization and contestation of linguistic power relations. For example, he did not accept the view that language policies are put into place “to enhance communication, to encourage feelings of national unity and group cooperation, and to bring about great social and economic equality” (2002: 5). Rather, he and other critical applied linguists, e.g., Luke and Baldauf (1990), argued that such assertions are merely covers for the *status quo*, and they criticize LPP for working within systems of dominant ideologies, thereby contributing to elitism, inequality, the privileging of Western-style models of development, and the repression or even extinction (“linguistic genocide,” Skutnabb-Kangas, 2000a) of multilingualism and multiculturalism.

One response by specialists in mainstream LPP to these charges has been that critical approaches critique, problematicize, and contest LPP, but do not offer workable and productive alternatives to put in their place (Fishman, 1994). Another has been that the language policies that are actually carried out in societies are seldom based on knowledgeable language planning theory, thus creating a large gap between informed analysis on one hand, and socio-political, socioeconomic, and sociolinguistic practices on the other. Another response has been that, while LPP methods can be improved, the underlying issues “raised by this [post-structuralist and neo-Marxist] criticism cannot be fully rectified, even were society to be entirely overturned and rebuilt. Authorities will continue to be motivated by self-interest. New structural inequalities will inevitably arise to replace the old ones” (Fishman, 1994: 98). If so, there is always the danger of exchanging one powerful group for another, particularly if the new group in power bears resentments over its former subordinate position and is eager to settle scores.

Finally, there is the concern that ideological motivations in LPP can lead to unintended negative consequences, or “unplanned language planning” (Eggington, 2002). Critical theorists who have accepted “the postmodern notion that ideologies of power inform and control every action, regardless of any attempts to create objective, or scientific, procedures in the language planning process” (Eggington, 2002: 410) are often unmindful of real world, human

factors that can, and probably will, thwart an ideological course of action, to the detriment of the people it was designed to help. Eggington (2002: 410) cited the demand for “linguistic human rights” (Skutnabb-Kangas, 2000b: 22) as an example of an “ideologically driven template”. Linguistic human rights takes the position that all linguistic minority children should be granted the right to learn and be educated in their parents’ native languages. As Eggington pointed out, the attempts to implement this ideology in the form of bilingual education programs have proven to be largely a failure because the ideological mindset behind them failed to foresee or take into account the human elements involved, e.g., the wishes of the parents for their children, the difficulties of training sufficient numbers of bilingual teachers, and the costs of establishing, maintaining, and ensuring quality programs.

Second Language Teaching

English as an International Language Historically, applied linguistics has been linked to second language (L2) teaching; consequently, critical applied linguistics has also given considerable attention to the sociopolitical critique of L2 education, in particular the role and position of English as an international language. In mainstream applied linguistics, the global expansion of English tends to be seen as either beneficial or neutral (Crystal, 1997). The English-as-beneficial position points to the advantages of having a worldwide lingua franca for international communication, while the English-as-neutral position considers it a utilitarian phenomenon resulting from events and processes that have been decades, if not centuries, in the making – and a phenomenon that may not survive long term, as has historically been the case with other languages of wider communication, e.g., Latin.

For critical applied linguistics, English is the international language of communication not for historical and now commercial, scientific, technological, diplomatic, and travel reasons, but rather for ideological, imperialistic, hegemonic, capitalistic – in short, political – reasons (Pennycook, 1994). Viewing language as inextricably tied to power, class, and socioeconomic relations, critical applied linguists reject the idea that global English can be regarded as either beneficial or neutral. In response to the former, they ask, “Beneficial for whom?” and their answer is that only the powerful and privileged elites in the world are advantaged by international English, whereas the less powerful or powerless are increasingly marginalized by not having access to English. In response to the English-as-neutral point of view,

critical applied linguists assert that there is no such thing as a neutral position, and that accepting the role of English in the world without a struggle is “an uncritical endorsement of capitalism, its science and technology, a modernization ideology, ... the Americanization and homogenization of world culture, linguistic culture, and media imperialism” (Phillipson, 1999: 274). An extension of the charge of imperialism is that in attaining linguistic dominance, English has contributed to the diminishment and death of other languages, as globalization, mediated above all through English, swallows up local cultures and languages, while educational systems throughout the world require students to study English at the expense of their local, indigenous languages.

Although English is currently the ascendant international language, indictments against the effects of its power can also be made against other major languages of the world. The dominance of Chinese (Mandarin Chinese), for example, has threatened the survival of at least 20 local languages in China. Spanish and Portuguese have contributed to the extinction or near-extinction of dozens of indigenous languages in Mexico and Central and South America. The power of Russian in Siberia has caused the disappearance of nearly all of the 40 local languages there. Moreover, Russian was so oppressively imposed on educational systems in the former Soviet Union that after its break-up one of the first acts of the newly independent eastern European countries was to replace Russian with English as a second language in the schools. And to this day France and Germany spend millions to promote French and German language and culture around the world. Whether through force of numbers, political and economic power, repressive measures, *laissez-faire* indifference, global competition, cultural marketing, or all combined, the pattern is unequivocal that the most widely spoken languages in the world have overwhelmed smaller languages in their spheres of power and influence.

This pattern is not set in stone, however, and there are indications of efforts to slow or halt the trend. As the realities of language endangerment and extinction have been increasingly publicized (e.g., by UNESCO), governments or official bodies have attempted to intervene on behalf of threatened languages through language policy and planning. For example, the European Bureau for Lesser Used Languages was established by the European Parliament in 1984 to protect the language rights of the more than 50 million people in the European Union who speak one of the 40 identified minority languages. As mentioned earlier, Mozambique as well as other African nations have worked to set up bilingual education programs

in order to provide linguistic minority children with greater access to education in both their native language and the official language.

There is also the possibility that the dominance of English may become increasingly resented, and in response, the emerging condition may be the decline of global languages and the rise of regional languages, e.g., Arabic. In Africa, for example, “English is neither the only nor even the best means of communication. Throughout East Africa, Swahili is typically the first language that two strangers attempt upon meeting. In West Africa, [it is] Hausa” (Fishman, 2000: 1). Regional languages may meet the wider communicative needs of people more effectively and may provide a greater sense of identity for its speakers than any international language. Perhaps, too, replacing English with a regional language in schools could help reduce the resistance many students display to the requirement of English as a second language in countries such as Sri Lanka (Canagarajah, 1993b). If these scenarios are realized, the role of English as a world language could be narrowed to a few academic and technical specializations in which journals for international audiences would continue to be published largely in English, with abstracts translated into other major international and regional languages. “There is no reason to assume that English will always be necessary ... for technology, higher education, and social mobility, particularly after its regional rivals experience their own growth spurts” (Fishman, 2000: 2).

English for Academic Purposes In mainstream applied linguistics, English for Academic Purposes (EAP) is a branch of English for Specific Purposes that came to prominence in the 1980s in response to the academic needs of the increasing population of L2 students enrolled in universities in which English was the medium of instruction. The goal of EAP is to help prepare L2 students for university study, usually in intensive programs of limited duration. It focuses on the development and improvement of academic language skills required for effective participation in undergraduate and graduate university programs, and to the extent possible, it is tailored to meet the needs of the students enrolled in EAP classes. Therefore, the first step in EAP is a needs analysis of the students’ academic goals and the types of language proficiency necessary to achieve them. Typically, EAP courses deal with (1) academic reading and the critical analysis of texts; (2) academic writing, both generally, e.g., the writing process, summarizing, paraphrasing, citing sources, and specifically, e.g., genre analysis or discipline-specific academic discourse such as the use of passive constructions in scientific and technical writing; (3) fluency and intelligibility of

speech, e.g., small-group discussions, oral presentations; and (4) academic listening skills, e.g., gleaning the gist and key points of lectures. Because the intent of EAP is to help students succeed in an academic setting, it is often characterized as a practical or pragmatic approach to L2 teaching (Benesch, 1993; Santos, 2001).

In critical EAP, the pragmatism of mainstream EAP is politically critiqued from the top down, starting with institutional power relations between EAP students and the academy. Academic institutions are seen in critical EAP as inherently and inequitably hierarchical in structure, and both students and the EAP faculty need not only to be aware of the power relations as such but also to be actively engaged in modifying their subject positions within them. Indeed, the very concept of EAP has been contested for accepting “an unproblematic relationship between English and academic purposes” (Pennycook, 1997: 257) rather than helping “students articulate and formalize their resistance [to academic requirements], to participate more democratically as members of an academic community and in the larger society” (Benesch, 2001: 61). Mainstream EAP is criticized for assuming (1) that institutional academic demands of students are the same as the academic interests of students themselves, and (2) that the appropriate goal of L2 teaching at the university level is to acculturate students to academic discourse rather than to encourage them to problematize and work to change it.

Thus, for example, to accept needs analysis as the starting point in EAP is to risk maintaining and perpetuating institutional conditions in which subject matter courses and content are elevated to the highest status, while English is relegated to serving merely as a medium for content. Instead, critical needs analysis emphasizes the political nature of academia and deconstructs “who sets the goals, why they were formulated, whose interests are served by them, and whether they should be challenged” (Benesch, 2001: 43). Rather than a medium, English is seen as a discourse for contesting and countering existing power relations. As a replacement for needs analysis, therefore, critical EAP introduces the notion of rights analysis, which focuses on alternatives to the academic *status quo* and posits that L2 students are entitled to more rights than they are accorded in determining the nature and substance of their academic experience in the university. “**Rights** ... highlight academic life as contested ... Rather than viewing students as initiates who must earn their place by adopting the discourse of faculty-experts, rights analysis assumes students are already members by virtue of paying tuition and taking classes” (Benesch, 2001: 62). In other words, instead of accepting as given the university’s expectations of students, rights analysis

emphasizes students' expectations of the university. EAP instructors are complicit in the marginalization of L2 students if they do not encourage them first to engage in a critical analysis of their positions as students *vis-à-vis* the faculty and the university, and then to exercise their rights by negotiating for change in their own academic interests.

What is also critiqued and contested is the academic discourse(s) that L2 students are typically socialized into in their EAP classes. Critical EAP challenges the academic language that L2 students are required to learn on the grounds that it also requires them to relinquish an essential part of their linguistic and social identities; more broadly, the academic knowledge they acquire in their majors or areas of specialization leads to the devaluation or destruction of the local knowledge they acquired in their native countries (Canagarajah, 1993a). In this way, dominant Western cultural traditions and knowledge threaten the survival of non-Western cultural traditions and knowledge, just as dominant languages threaten minority languages. An example of resistance to this domination can be seen today in France, where Arab language and culture is in conflict with French language and culture in the schools and the society. From the critical perspective, a resolution to the conflict is for minority groups to be encouraged "to construct alternate discourses that derive from a negotiation of the academic discourse and English [or French] language in light of their indigenous forms of knowledge, discourses, and languages" (Canagarajah, 1993a: 304). While acknowledging that educational systems might not welcome alternate discourses to academic conventions, Canagarajah argued that indigenous languages and knowledge systems should be considered equal to dominant academic discourses, and that ultimately, schools and universities will be enriched by accepting linguistic, intellectual, and academic pluralism.

The responses of mainstream EAP to the positions of critical EAP take several forms. One is that it is not L2 students themselves who are calling for challenge and change to the academic institutional structure of higher education or to the dominant academic discourses and knowledge systems; rather, it is critical educators who consider power relations paramount in all institutional arrangements and who therefore take it upon themselves to work to raise the consciousness of their students so that they are made aware of their subordinate subject positions and will act to change them. Another is that it is unrealistic and perhaps undesirable to think that the accretion of generations of knowledge and discourse that go into the development of an academic discipline can, will, or should quickly give way to the kind of linguistic

and intellectual modifications proposed by critical theorists, especially when students are usually not only willing but eager to be socialized into their chosen disciplines. A third is that the very presence of a critical mass of L2 students in higher education naturally and unobtrusively promotes pluralism in academia. Influence and negotiation are a two-way street, and just as Third World students are changed by immersion in Western intellectual traditions, so are Western universities changed by the linguistic, cultural, and intellectual resources that Third World students bring to them. The changes may at first seem minor or imperceptible, but over time they are felt and noticed, particularly in terms of language. Perhaps an appropriate analogy here is the way English as an international lingua franca has led to naturally occurring varieties such that we now talk about world Englishes – the plural signifying pluralism *par excellence*.

Adult Second Language Teaching The mainstream approach to adult second language teaching, which takes place in societies where the second language being learned and taught is the dominant/national/official language, is typically characterized as learner centered. Learner-centeredness is understood to mean that, since most adult learners have voluntarily chosen to attend language classes, their goals and desires for learning the language should be not only respected in the abstract but also acted upon by incorporating them into the syllabus and classroom practice, even in cases where the teacher may be philosophically opposed to the students' wishes, e.g., explicit instruction in grammar. Adult language learners are consulted as to (1) the content of the class based on common needs and interests, e.g., employment or housing issues; (2) the pacing of the course, i.e., when students feel they have reached a satisfactory level of understanding, proficiency, and practice for a particular concept or lesson, and are ready to move on; and (3) the degree to which the class is teacher centered, e.g., with explicit explanations, corrections, etc., or student centered, e.g., with pair work, group work, and other communicative activities.

A critical approach to adult language teaching rejects the mainstream view of learner-centered classrooms and its foundational assumption that adult learners "know what they want and what is 'best' for them, that giving learners choice is in itself empowering, and that the teacher should follow their lead" (Auerbach, 2000: 145). Learner-centeredness is also criticized for its unquestioning acceptance of the primacy of meeting students' needs and for implicitly supporting the ethos of opportunity and upward mobility that assumes an environment of individual choice and betterment. Instead, critical

pedagogy in adult education – often called ‘participatory learning,’ after Freire (1970) – is based on the premise that empowerment and improvement in the lives of subordinate groups can come about only through an understanding of the inequitable power relations in society and subsequent collective action to change these oppressive conditions. Therefore, in keeping with the tenets of critical theory, the explicitly political goals of the adult language classroom, whether in Latin America, Africa, North America, or Europe, are (1) sociopolitical critique of students’ lives, daily experiences, and circumstances in their communities *vis-à-vis* the dominant ideology and power relations of their societies; (2) problematization, or Freirean problem posing, of these experiences and circumstances through critical reflection and discussion; and (3) strategies for collective social and political action to effect change through a democratic process and to try to provide marginalized groups with the means to work within their own systems for the betterment not only of their own lives but also of their communities.

In contrast to critical pedagogy at other levels of education, which has tended to avoid presenting specific pedagogical practices out of fear of becoming a prescriptive methodology, adult language teaching from the critical perspective has from the start provided examples and case studies of alternative rationales, curricula, and activities; moreover, these have been sufficiently detailed to allow interested teachers and other applied linguists to envisage what a critical classroom would actually look like in practice. Auerbach and Wallerstein (1987) were among the first to outline their work with adult ESL learners in the United States, and Auerbach (1992, 1996, 2000) has continued to present her principles and practices of participatory pedagogy. Drawing on the common issues in the lives of Latina women in Washington, D.C., Frye (1999) discussed the critical, participatory curriculum she developed for her ESL class. In Canada, Norton (1995) and Morgan (1998) gave accounts of critical approaches to teaching adult ESL in different settings in Ontario. Kerfoot (1993) described the critical/participatory curriculum and materials developed by a nongovernmental organization for adult ESL programs around Cape Town, South Africa. And two volumes (Smoke, 1998; Sauve, 2000) have been devoted entirely to programs and practices in critical adult ESL.

It is interesting to note that, alone, among the branches of critical applied linguistics, adult language teaching has received no oppositional response from the mainstream. Why this is so is a matter of speculation, but it may speak to the general lack of interest and attention, even among professionals, both to

adult basic education and to adult second language programs. Public funding for the development and maintenance of such programs is almost always inadequate, and the minority and/or immigrant groups in need of adult second language classes are typically viewed by the public with indifference or even hostility. Just as the students are socioeconomically and sociopolitically marginalized, so, too, are the mostly part-time language teachers who work with them. The combination of these circumstances contribute to, if not cause, the outlier effect for adult language education; adult second language learning and teaching seem to fly under the radar. However, it may also be that a critical/participatory approach to adult second language teaching is seen as the most appropriate for this student population, more than for any other. The sociopolitical critique of structural inequalities, the concomitant questioning of these inequalities, and the search for collective ways to work for social and political change may be the most realistic and effective way to structure adult second language classes.

Conclusion

A political, and politicized, approach to applied linguistics and second language teaching has been variously described as “applied linguistics with an attitude” (Pennycook, 2001: 177), as a series of “social visions” (Norton and Toohey, 2004: 1), and as a pedagogy that is “in your face” (Santos, 2001: 182). As a relatively recent movement that began in the late 1980s, gained momentum in the 1990s, and continues into the 21st century, it is not clear whether critical theory and pedagogy will remain an oppositional, alternative perspective or whether it will gain currency in mainstream applied linguistics. It has attracted dedicated specialists who are drawn to its hope of sociopolitical transformation and who seek ways to realize that hope through localized practices in language education.

One of the hidden dangers of a critical approach is the possibility of an activist counterresponse from its political polar opposite. Critical theory and pedagogy assume a shared **liberatory** vision; however, a shared conservative vision that is anything but liberatory is not out of the question. Indeed, Pennycook (2001: 29) touched on this very point when he acknowledged the possibility of “a potential position . . . that combines conservative politics and applied linguistics.” But instead of exploring the implications of such a potential, he dismissed it by saying, “Since conservatism is an anathema for my vision of critical applied linguistics . . . , I do not dwell on this possibility” (2001: 29). Whether too distasteful to dwell on or not, however, the possibility remains.

Finally, when speculating on the role of critical applied linguistics in the future, it is necessary to consider such factors as the number of students in teacher preparation courses who can be won over to an overtly political approach to language teaching; whether conditions they find in language programs in which they are hired to teach allow for or are conducive to critical approaches; whether their language students are accepting of or resistant to critical classroom practice; whether alternative teaching and learning materials are available or permitted; and the degree of individual commitment to critical pedagogy even in the face of indifference or opposition. In all likelihood critical theory will continue to be espoused; the question is whether critical pedagogy will be carried out on any but a relatively small scale.

Power and Pragmatics

Introduction

Pragmatics is concerned with meaning in the context of language use. Basically, when we communicate through language we often mean more than we say; there is often a gap between speaker meaning and sentence meaning. For example, why is it that we interpret *Can you pass the salt?* as a request and not simply a question? Why do we tend to interpret *John has three children* as meaning **no more** than three children? Why, when we say *some of the boys came to the party*, do we know that **not all** of the boys came to the party? And why do we find that certain utterances are paired, such as greeting/greeting, question/answer, or request/response? Pragmatic theories attempt to explain this knowledge by seeing communication as a process of rational and reasoned interpretation, which draws not only on linguistic structure but also shared and world knowledge, cultural norms, and individual components of specific interactional contexts (see Levinson, 1983, 2000; Sperber and Wilson, 1995; Yule, 1998; Mey, 2001; Blakemore, 1992). The question we want to consider here is how this view of human communication is related to the operation of power in society.

Pragmatics, Power, and Language

Pragmatics is recognized as a branch of language study and in recent times the operationalization of power within, or through, the use of language in society has become a central concern of discourse

analysis, sociolinguistics, and pragmatics. Textbooks are now giving specific emphasis to the area (see Mesthrie *et al.*, 2000) and there are emergent branches of study, such as critical linguistics, critical discourse analysis, or critical sociolinguistics (see Fairclough, 2001; Wodak, 1996; Talbot *et al.*, 2003), where it is the analysis of power within linguistic practices that is the core focus. The term 'critical' links these approaches closely with social theory and their central aim is to demystify the way in which language operates in society. The term 'power' is not always easily defined, however (see Thornborrow, 2001). Power can be ideological, economic, or cultural, for example, and within these confines, power can operate at a range of different levels: the social, individual, military, state-based, legal, and so on. Though all this is true, there is a general understanding that the operation of power is the ability to get an individual to behave or not to behave in a particular manner. Although this process may be realized in different ways and in different social environments, the pragmatic resources utilized may be of the same type. The problem is, of course, that not everyone has the same access to such resources, and, even when they do, not everyone has the same ability to use those resources in the same way. Hence, some individuals or groups may access or use pragmatic resources to maintain a position of power over others (Harris, 1984; Lakoff, 2000; Hutchby and Wooffitt, 1998).

Consider, for example, the act of ordering someone to do X. Parents may order a child to be quiet, an army officer may order soldiers to *march*, or a police officer may order a motorist to *stop*. Orders or commands such as *Stop!*, *Be quiet*, or *Quick march*, are imperative forms that function to signal a specific

action or, as it is known, a 'speech act' (Austin, 1962; Searle, 1969) (see **Speech Acts**). Speech acts frequently have linguistic markers that indicate which act is being performed, such as *I apologize*, or *I order you to X*, but frequently the act is underlying or indirect, as in (*I order you*) *March!* But equally important in producing speech acts is the recognition that certain conditions hold, such as X has the authority, right, or power to order Y. In the examples above, this power condition is institutionalized within the system of parental control, within the legal system for traffic law, and within the formal authority of army hierarchy. Thus, although we can all produce orders, we do not all have access to formal roles that ensure the order is carried out. Hence, in contexts such as schools, medical encounters, or certain forms of business organizations, the power to utilize selected pragmatic resources is differentially distributed (Drew and Heritage, 1992; Bourdieu, 1991; Lippi-Green, 1997) (see **Institutional Talk**).

This type of control may be seen in the organization of talk in interaction. Here, there are issues of not only who can say what, but who can speak when and about what topic. Studies of the distribution and organization of taking turns at talk clearly show that in schools it is the teacher who organizes and distributes the turns at talk (Coulthard, 1977). Similarly, in the doctor's surgery, it is the doctor who is in control; it is his job to ask the questions and the patient's job is simply to respond (Wodak, 1996). In these contexts, there is an interactional asymmetry in relation to responsibility for talk organization. Indeed, in the case of either the school or the surgery, for the student or the patient to begin to ask questions or to take the lead in talking would be seen as a challenge to the power and control of the doctor or teacher.

But it need not be a specifically formal situation where such forms of control operate. Studies of gender differences have continually indicated that in mixed-gender interactions, men attempt to dominate the control of turns, access to the floor, and topic content and distribution (Talbot, 1998; Tannen, 1994). As Shaw (2000) has shown, things become even more complicated when gender and formal context are mixed. In a study of what may be termed 'illegal' interruptions in British House of Commons Proceedings, Shaw noted how male MPs made such interruptions more frequently than female MPs. Furthermore, when women MPs did carry out such actions, they were more frequently censured for this by the Speaker of the House.

Instrumental and Influential Power

The pragmatic control of turns or of specific speech actions could be seen as the use of instrumental

power. Instrumental power is often formally embedded as a system of control either explicitly formulated as within the law or more subtly ingrained within what Foucault called "regimes of truth" (Foucault, 1980), that is, the control over access to certain forms of knowledge. But there is also what is seen as influential power in the operation of pragmatics, and here this may be seen in almost all walks of life, although influential power is more often highlighted in the workings of the media, particularly in advertising, and in politics (Talbot *et al.*, 2003; Bell, 1991).

Consider a burger chain advertising statement: *where good people go for good food*. How are we meant to understand this? There is a clever juxtaposition between *good* as a moral/reflective issue and *good* as a comparative adjective of assessment. In the advertising strap line, there is an effort to get us to process the phrase *good people* and *good food* together. But why? According to Grice (Grice, 1975; see also Sperber and Wilson, 1995) what happens is that the juxtaposition of *good people* and *good food* creates an incongruity in terms of the relevance of the claim. It is incongruent, argues Grice, because communication is based on an assumption of cooperation, where we try to speak the truth in a clear and concise manner as simply as is necessary to convey a message relevant to the talk. This gives one answer to our question above as to why we assume that John has no more than three children when someone says *John has three children*. If John had more or less than three children, then according to the pragmatic principles espoused by Grice, the speaker would have said so (see **Grice, Herbert Paul**).

Grice does not say that his principles are rules that must always be in operation, or which must be obeyed, merely that they provide a heuristics for interpretation. Interestingly, he also suggested that when a speaker says more or less than required, is obscure, or seemingly irrelevant, this may be an indicator that they intend their hearer to look beyond the meanings of the words themselves in order to retrieve the message. In this case, the speaker may be generating a specific kind of inference referred to as a 'conversational implicature' (see Levinson, 1983). For example, if I say *John was in the room* in response to your question *Where have all the apples gone?*, this does not seem to be an answer at all. However, if you assume I am being relevant and saying as much as possible, then you will try to see my response as an answer. Perhaps in this case we both have shared knowledge that John likes to eat apples; if that was the case, you could then infer both that although I do not know who took the apples (if I did I would have said so) I believe/infer

that John has taken the apples. The reason I believe this is because, as we jointly know, John really likes his apples, he was in the room, and now the apples are missing. Formally, there would be more to explain here, but the general point is that from a particular utterance we can gain more information than is readily available from sentence interpretation alone (see **Implicature**).

What then has the process of eating *good food* to do with the moral or other inclinations involved in being *good people*? One answer is that eating food involves choice. We often hear it said after an enjoyable meal at a restaurant that either the food or the restaurant itself, or both, was a *good choice*. Hence, eating out also involves some discernment on behalf of the customers. And those who are *good* at this get *good food*. Hence, in this case, not only can you enjoy the *good food* but you can give yourself a pat on the back as one of the *good people* capable of making a good choice.

Good people (those who know or care) go for good food to X.

There is also a more general interpretation here, simply that this restaurant is where *good* people go for their food. Since most of us wish to think of ourselves as *good*, then this restaurant is the place to be. Both assumptions would be worked out using a similar approach. In both cases, the message is clear: if you consider yourself *good* in either (or even more) of the interpretations provided, then you should be in restaurant X.

This kind of influential power attempts to control our actions by pushing our choices in a particular direction. Since *good* may be taken in a number of ways, it expands the range of audiences that it might influence. Thus, any ambiguity is utilized for a positive purpose, as is the case with the politician before an election who says *We have no intention and see no reason at this time to raise taxes*. In this case there are two elements worthy of attention. The first is the negation of the term *intention*. If intention means one is going to do X (raise taxes), then this is denied. However, in the second part of the sentence the adverbial *at this time* marks any intention as time- and context-based. Consequently, if at a later time one does raise taxes (after being elected for example), one could not be accused of having previously misled the public.

Such time-controlled modifications are frequent in the political domain. The British Prime Minister stated, in relation to Britain's involvement in the Iraq conflict in 2004, that "At the present time, we believe, we have sufficient troops" (in Iraq). We see the use of the adverbial again, but also in this case the use of an epistemic marker of knowledge,

i.e., *believe* as opposed to *know* (see Chafe and Nichols, 1986). *Believe* is weaker than *know* and may be used to 'hedge' any claims. Should future events prove against one's statement, one can always say that is what I believed at the time.

Pragmatics, as may be seen, is central to the operation of power in society. In formalized contexts, it explains acts in terms of their conditions of operation; similarly, it explains in such contexts, and others, who is expected talk when and about what. It also allows us to see how embedded inferential information may be calculated to explain specific messages and similar embedded information may be used to sidetrack us or to protect the speaker. Knowledge of pragmatics is therefore central to understanding power and its role in human communication.

Pragmatic Acts

A Philosophers' Mistake

An often heard critique of the Searlean approach to speech act theory (and, by implication, also of Austin's and Grice's; see Mey, 2001: 93–94) is that it concentrates on 'speech' to the exclusion of other phenomena (e.g., writing) that also fall into the category of 'language.' As a result of this critique, some linguists have suggested that we replace the term 'speech act' by a more 'general' one, such as 'act of language' (compare also the French distinction between *acte langagier* and *acte de parole*; German has *Sprachhandlung* as opposed to *Sprechakt*; Bühler, 1934) (see **Speech Acts**; Grice, Herbert Paul; Austin, John L.).

What is at stake here is more than a terminological quibble. Those who want to consider speech as different, less comprehensive than 'language' overlook the fact that all language originates in speech; writing is a later development, arising from the need to preserve the spoken word for later and remote use. However, there is a wider implication, one that is equally often overlooked by linguists and many philosophers alike. As Searle (1969: 16) remarked,

When I take a noise or a mark on a piece of paper to be an instance of linguistic communication, as a message, one of the things I must assume is that the noise or mark was produced by a being or beings more or less like myself and produced with certain kinds of *intentions*.

In the standard philosophical approach to language, as we encounter it in works by thinkers such as Frege, Russell, Carnap, Reichenbach, Lewis, and a host of other earlier philosophers, the fundamental unit establishing and legitimating our acts of thinking and speaking is the abstract proposition, as it manifests itself in the well-formed linguistic sentence. In this approach, the user of language is conspicuously absent, and consequently so, too, are his or her intentions. For linguists such as Chomsky and his followers, the persistent problem is how to connect a certain representation of the world with a given, well-formed linguistic expression. However, people do not always necessarily think in propositions representing well-formed abstract formulae; nor do they speak in correct sentences, derived according to the rules of an abstract grammar. Regarding people's world representations, the 'intentionality' that Searle points to comprises more than just cognizing: Affect, will, ethical considerations, and so on have to be taken into consideration when we talk about 'mental states.'

Combining these different facets of human mental activity is often thought of as a process of 'addition': To a given propositional content (e.g., 'to shut the door') I can add a volitional component (as in 'I want you to shut the door'), a component of ordering (as in the imperative 'shut the door!'), a component of questioning (as in 'is the door shut?'), and so on. These additional components are then manifested by their appropriate speech acts: wanting, ordering, questioning, etc. It is this kind of thinking that is at the basis

of Gazdar's (1979: 4) often quoted formula: 'Pragmatics is meaning without semantics.'

The main difference between speech act theorists such as Searle (one could also mention others, such as Austin, Ryle, and Grice) and linguists such as Chomsky is that the former include the speaker's mental state in their considerations of 'how to do things with words' (Austin, 1962). However, another problem arises here, having to do with the nature of the speech act as primarily defined (in the Searlean approach) in relation to an 'ideal speaker' (the hearer, if present, is similarly idealized). Thus, Searle's approach not only is basically speaker oriented (the hearer being thought of as a speaker who is temporarily 'out of function' – one who is listening to a speaking person in order to become a speaker himself or herself) but also, both speaker and hearer are located in some abstract, idealized universe, devoid of any relation to their actual status as language users. Even where dialogue or conversation is concerned, the question of what the speakers are saying to each other is discussed from a strictly idealized, speaker-oriented viewpoint; thus, questions as well as answers are uttered by dummies figuring as speaker/hearers (e.g., the ubiquitous 'Peter' and 'Mary'). It is in this sense that we must understand Levinson's (1983: 293) often quoted remark that there is no such thing as abstract 'questionhood' or 'answerhood': all questions and their corresponding answers originate in real-world language users. A question is always a concrete somebody's question, and an answer is always given by somebody with real expectations, needs, and obligations.

However, if this is true for questions and answers, then it must hold for other speech acting as well. There are no orders except those given by a superordinate to a subordinate. The speech act of ordering is widely different, for example, in the military than in the family; although it is true that everywhere certain people give orders while others have to take them, the difference is in the people and their placement in society. Similarly, there are no promises except those given by a concrete 'promiser' to a concrete 'promisee,' as they are characterized by their actual living conditions, especially when it comes to understanding what a promise is about, being able to accept a promise, and so on. Also, regarding ordinary conversation, the accepted ordering sequence of the individual replies not only represents some external schema (as used in conversation analysis) but also reflects and reproduces the power structure of our society: The powerful grab the floor, whereas the weak withdraw under pressure (see **Conversation Analysis**).

A final aspect (partially adumbrated in the preceding) is essential to our understanding of speech

acting. A speech act never comes alone but carries always with it a bevy of other acts on which it essentially depends for its success (see **Speech Acts and Grammar**). Some of these are strictly speech oriented, whereas others are of a more general nature and include, besides speech, those aspects of communication that often are referred to as 'extralinguistic': gestures, intonation, facial mimics, body posture, head movements, laughter, and so on. It is these inclusive acts that I call 'pragmatic acts' (see **Pragmatics: Overview**).

An Illustrative Case: The Irony of Irony

I now illustrate the previous discussion by adducing a classical instance of purported speech acting: the use of irony in speech. Much has been written about irony by linguists, philosophers, sociologists, computer scientists, psychologists, and others. I limit myself here to contrasting two characteristic approaches from different camps: one linguistically and philosophically oriented, and the other more geared toward a computational view (see **Irony**).

Sperber and Wilson, two of the best known authors writing on the subject of irony from a philosophical-linguistic standpoint, have expressed their views on the subject in a number of important contributions. Here is a typical quote:

"Irony plays on the relationship between speaker's thought and the thought of someone other than the speaker" (Sperber and Wilson, 1986: 243).

According to these authors, the speech act of irony is, in the final instance, expressive of a purely mental process, contrasting two thoughts: the speaker's and someone else's.

In contrast to this mentalistic view of irony, others have taken the stance that irony is first of all a situational phenomenon: "Ironic language presupposes an ironic situation, either in the *hic et nunc* or ... in the human condition at large" (Littman and Mey, 1991: 134). Specifically, a situation is ironic whenever the acting persons' explicit or implicit goals clash with the reality of their acts. For example, consider the firefighter whose smoking in bed causes the fire station to burn down: His implicit goal, to prevent fires, clashes with his explicit acting, causing a fire to break out. This 'clashing' of act and intention is not only typical for irony but also typical for all sorts of humor; cf. especially Freud's definition of humor as "a shock between two heterogeneous or incompatible worlds" (as quoted in Haverkate, 1990: 107; Freud, 1916/1948). Similarly, in Littman and Mey's (1991: 135) terminology, irony is based on a 'twist' that

“appears to depend upon some relationship between (1) the actor’s goals, (2) the actor’s plans, and (3) the actor’s state of knowledge about the likelihood of the plan succeeding.”

Irony thus presupposes an ironic situation, one in which an actor’s plans somehow come to naught through his or her own fault or lack of knowledge, as attested by Robert Burns’s “best laid schemes of mice and men” that sooner or later all “gang agley” – most often through the actors’ own doings. If we accept this view of irony, then it should be evident that the acting is a central ingredient of any kind of ironic utterance; in fact, ironic utterances are only possible within some kind of action frame, viz., an ironic situation that makes the irony possible. Irony is thus, strictly speaking, not a speech act by its own volition and authority; its quality of ‘act’ depends on the acting persons and their views and knowledge of the situation in which they act.

It follows that ironic utterances are not, as Sperber and Wilson (1981: 302) maintain, basically to do with speaker attitude but with the world; not principally with speaking but with acting. The distinction between ‘using’ an utterance and ‘mentioning’ it (in irony) that these authors advocate (Sperber and Wilson, 1981) thus turns out to be just as vacuous as the time-worn distinction between ‘saying’ and ‘meaning’ when applied to irony (cf. Booth, 1974). As to ‘mentioning,’ this is itself a case of language use and thus not essentially different from other ‘use’; as such, it is situation dependent. Speech, by itself, does not act: strictly speaking, there are no speech acts since, ultimately, all speech acting crucially depends on the situation in which the action takes place. Hence, speech acts, in order to be viable, have to be ‘situated,’ as discussed next.

Acting in a Social Situation

Previously, I stressed the need to think of speakers and hearers as acting in a social context. In traditional linguistics, the user, when and if he or she appears on the scene (as we have seen it happen in Searle’s or in Sperber and Wilson’s works), is always defined as an individual speaker whose words are spoken in the abstract space of ‘exemplary thinking’: The utterances that are produced lack any anchoring in the societal reality and invoke a context only as needed to make (minimal) sense. Such a context is never extended beyond the immediate needs of the description; it is not one that is solidly placed in the speakers’ and hearers’ actual social environment, a *situated* context. Similarly, the voices that we are hearing in the constructed dialogues of linguists’ examples belong to lifeless characters (e.g., the famous ‘Mary’

and ‘Peter’) and not to real, interacting persons on a common, social scene (Mey, 1994: 155) (*see Context, Communicative*).

Typical for the social situation is that it is a common scene – that is, a situation whose participants are on some kind of shared footing. Elsewhere (Mey, 2001: 135), I have advocated the necessity of situating our speech acts in context, especially with regard to analyzing people’s conversation. The reason is that no speech act, or any conversational contribution, can be understood properly unless it is situated within the environment in which it was meant to be understood. ‘Quoting out of context’ is a well-known means of manipulating a conversational partner; the proper use of conversational techniques excludes such manipulation precisely in the name of good conversational behavior.

In particular, the French sociologist Jacques Rancière (1995) applied the notion of ‘common scene’ to the political domain. Here, politics is defined as the “battle for the common scene of understanding” (Rancière, 1995: 13) – a battle that is not merely about defining a common ground, in the sense of establishing some common definitions or some common conceptual framework, but primarily about what is understood as being common, by ruling out various kinds of ‘misunderstanding’ (the title of Rancière’s work). The point is that such a ‘ruling out’ should not be conceived of as a one-sided ‘ruling’ (in the sense of a judge ruling some question out of order) but as an appeal to the commonly accepted rules for making and breaking a social relationship. It is here that the notion of ‘social’ situation becomes crucial.

Rancière’s ‘social scene’ is more than a simple context, understood as a common platform of conversation; rather, the question that he raises concerns the underlying presuppositions making the scene possible. This possibility involves what the actors can afford, not just what they can think and cognize. Thus, the common scene is ‘transcendental’ in an even deeper sense than Kant’s: Not only the possibility of thinking and cognizing but also the very possibility of acting is questioned. This is why Rancière’s notion of common scene is so important for the theory of pragmatic acts (*see Pragmatic Presupposition*).

Understanding a scene depends entirely on the acting. An active understanding implies having an idea of what to do on the scene, not just of what to say or think (these latter, although important, are still subordinated to the acting). Conversely, one’s understanding of others depends on understanding their acting and the role they assume on the scene. What may appear as crazy behavior outside of the theater

(cf. the expressions, a 'theatrical' laugh, to assume a 'tragic' posture, or even to put on 'an act') is perfectly understandable and rational on the scene, where role and rationality depend on each other. Rational acting is to act in accordance with one's role; any acting outside of that role is irrational (besides being strictly speaking impossible if one wants to keep one's place, both as an actor on the scene and as a member of the theatrical company).

Pragmatics tries to place the common scene within society by making it clear that also on the societal scene at large (and not just in politics) a 'battle' for domination is going on. If we do not understand this battle as a struggle between the forces of society, our understanding of the common scene and its actors will be incomplete. Conversely, our acting is determined by the scene: The scene's 'affordances' (a term from psychology; Gibson, 1979) are the limits of our actions. Common affordances create a common platform for action; a lack of such affordances restricts our possibilities of acting socially. Inasmuch as our acting depends on our understanding of the scene and its affordances, the scene is only 'actable' for all actors if it has been established as common – that is, affordable for everybody and by everybody.

From the previous discussion, it is clear that not only the scene determines our acting but also, conversely, our actions determine and reaffirm the existing scene. We profess adherence to our common platform by acting within its confines, by obeying its limitations, and by realizing our possibilities. Our acting on the scene (this includes our so-called 'speech acts') is thus always a 'situated action' – that is, an action made possible and afforded by and in a particular situation. The next section explores in more detail what this has to say for the question of pragmatic acts.

The Indirect Speech Act Paradox

In the literature, one frequently comes across the following vexing question (e.g., Mey, 2001: 113, 219; Searle, 1975: 82): How to explain that our speech acts more often than not are realized by expressions having very little to do with the literal interpretation of those expressions, but rather much with their conventional interpretation?

The traditional approach to this 'indirect speech act paradox' suggests that we either rely on such expressions being understood as idioms or rely on our using certain rules of inference (Levinson, 1983: 268–272, 2000: 16). A pragmatic solution to the paradox would have to go further and specifically ask what those rules are and how they are administered. Just like other speech acts (or, generally, any way of using words to

do things), the so-called indirect speech acts derive their force not from their lexicosemantic buildup but from the situation in which they are appropriately uttered. This 'situational support' rests on the assumption that every situation carries its own organizing principle. That is, the conventions and rules of society determine what is appropriate speaking behavior for a particular situation.

In early speech act theory, this led to the erroneous assumption that the preferred response was the only legal one: the so-called 'canonical' speech act, expressed by an appropriate speech act verb – promises require a verb of 'promising,' orders one of 'ordering,' and so on (Mey, 2001: 184) (*see Speech Acts, Classification and Definition*). Although this rigid interpretation of the principle is unacceptable (it would lead, among other things, to the rejection of indirect speech acts as 'improper'), the notion that the situation has a heavy hand in defining and determining what we say is valid. The situation, so to speak, creates the 'affordances' by which we are guided toward a correct interpretation of what we are hearing, and indeed of what we ourselves are saying (in accordance with the observation that we have not properly understood our own utterances until somebody has understood them with us – an insight due to the Danish linguist Jesper Hermann (1992)). Here, we are in touch with the very roots of speech act theory, as it was conceived by Austin (1962: 100, scare quotes as in the original), who carefully (not to say cautiously) referred to the situated utterance as "[words] to some extent 'explained' by the 'context' in which they have been actually spoken." Recall also that it was Austin's original intention to "study the total speech in the *total situation*" (Austin, 1962: 148 (*italics added*)).

Summing up, speech acts, in order to be effective, have to be situated. That is, they both rely on and actively create the situation in which they are realized. Thus, a situated speech act comes close to what Hymes (1964/1977) called a 'speech event' in ethnographic and anthropological studies (cf. Bauman and Sherzer, 1974): speech as embedded in an institutionalized social activity of a certain kind, such as teaching, visiting a doctor's office, and participating in a tea ceremony. In all such activities, the role of speech is prescribed; only certain utterances can be expected and will be acceptable. On the other hand, by their very acceptance of whatever is said as a situated utterance, the participants establish and reaffirm their social situation. The emphasis is no longer on describing individual speech acts (as it was for Searle and his followers) but on figuring out how a particular act of language came to be used in this particular situation and with what effect. Regarding Hymes's speech event, although the words spoken by

the participants require an understanding in terms of the language used, the individual speech acts make sense only when framed in the event.

In this way, the indirect speech act paradox can be dissolved by moving the focus of attention from the words being said to the things being done. In the sense that 'indirectness' is a straight derivative from the situation, and inasmuch as all speech acting depends on the situation (with its dialectic feedback, as we have seen), one may say that in this situational sense, there are only indirect speech acts; alternatively, no speech act, in and of itself, makes any sense. *A fortiori*, there are, strictly speaking, no such 'things' as speech acts *per se*, only acts of speech in a situation. The next section provides more details.

Situated Acting: "The Body Speaks" (John Donne)

The philosophers' mistake, referred to previously, was to believe that we can explain our use of 'words in action' by referring to individual speech acts with well-defined properties, assigned in accordance with certain philosophical and linguistic criteria. We have seen how efforts to break out of this linguistic and philosophical straitjacket (such as by Searle and the post-Searleans or by the followers of Sperber and Wilson) have failed in the end. The reason is that no isolated theory of language or the mind will be able to explain the workings of the human user in a concrete situation that depends neither on the mind nor on language exclusively and that consequently cannot be expressed in terms specifically created for describing the linguistic or mental domains.

In contrast, a pragmatic approach to speech acting will, as its first and most important business, raise the question of the user's possibilities in a situation. To use a parallel from another mental activity, vision: seeing is not a simple matter of an object reflecting itself in the mind, it is the situation that, along with the active perceptive categories, 'creates' the objects of perception in accordance with the possibilities afforded by the situation (aptly called 'affordances' by Gibson, 1979). Similarly, when we use language for communication, what we expect to hear is what we can, and actually do, understand in the situation. However, this situational 'affordability' comprises more than just the words spoken. As Charles Goodwin (2000: 1492) pointed out, in the "situated interaction" that takes place, for example, among girls playing hopscotch,

the construction of action through talk ... is accomplished through the temporally unfolding juxtaposition of quite different kinds of semiotic resources ... through this process, the human body is made publicly visible as

the site for a range of structurally different kinds of displays implicated in the constitution of the actions of the moment.

Goodwin goes on to illustrate this 'use of the body' as one through which participants in situated action make reflexive references to their speech by positioning themselves in the other participants' line of vision, using gestures not just to illustrate but also to actually execute speech acts (e.g., of asserting, contesting, and supporting). More generally, conversational 'moves' are not only realized through speaking in ordered sequences; the body may 'jump into' the conversational fray and change the course of the interaction, preempt a conversational turn, seize the floor, and the like. An act such as 'seizing the floor' is accomplished nonverbally; turn-taking is not only prefaced by, or even merely accompanied by, a body movement: The body move *is* the taking of the turn, as it is performed by dint of a "hybrid system" (Goodwin, 2000: 1516). This interaction between action and speech cannot be captured by a simplistic notion of 'speech act,' no matter how well defined. A proper label to put on those concerted actions is that of the 'pragmatic act' as the locus where all the different linguistic and semiotic structures converge and are properly ordered in communication.

Conclusion: Pragmemes and Practs

The theory of pragmatic acts does not explain human language use by starting from the words uttered by a single, idealized speaker. Instead, it focuses on the interactional situation in which both speakers and hearers realize their aims. The explanatory movement is from the outside in, rather than from the inside out: Instead of starting with what is said, and looking for what the words could mean, the situation in which the words fit is invoked to explain what can be (and is actually being) said.

The emphasis here is not on rules for use of individual speech acts but on characterizing a typical, pragmatic act as it is realized in a given situation. Adopting familiar linguistic terminology (cf. terms such as phoneme, morpheme, etc.), I call this (proto-)type of act a 'pragmeme.' Individual pragmatic acts realize a particular pragmeme (e.g., 'inciting to declare war'); we may call these 'practs.' However, since no acts ever will be completely identical (every situation in which war is declared is different from every other), every pract is also an 'allopract' – that is, a different realization of a particular pragmeme. The Israeli linguist Dennis Kurzon, who has worked specifically in the area of 'incitement,' supported this view when he said that "any utterance may constitute an act of incitement if the circumstances are

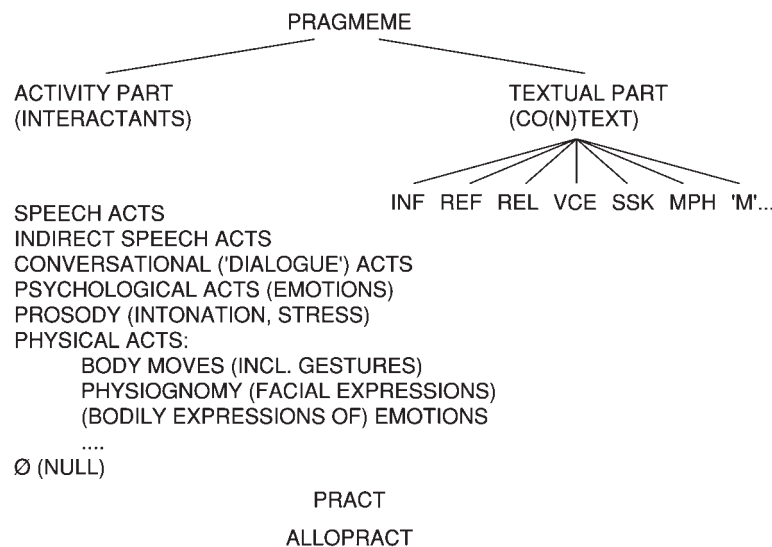

Figure 1 Pragmeme, pract, allopract. Adapted from Mey (2001: 222).

appropriate to allow for such an interpretation” (Kurzon, 1998: 587; Mey, 2001: 221).

With regard to pragmatic acts, one is not primarily concerned with matters of grammatical correctness or strict observance of rules. What counts as a pract (i.e., what can be subsumed under a particular pragmeme as an allopract) depends on the understanding that the participants have of the situation and on the outcome of the act in a given context. Schematically, this can be represented as shown in **Figure 1**.

In **Figure 1**, the various abbreviations to the right have to do with textual features, such as INF for ‘inferencing,’ REF for ‘establishing reference,’ REL for ‘relevance,’ VCE for ‘voice’ (cf. Mey, 2000), SSK for ‘shared situation knowledge,’ and MPH (for ‘metaphor’). The symbol ‘M’ denotes a ‘metapragmatic joker’ – that is, any element that directs our attention to something happening on the metapragmatic level. For instance, changing the order of the words in a sentence may tell us something about the relative importance of the transposed elements. Using the standard expression ‘alleged’ in a report may serve to exonerate the journalist from implicitly proffering an accusation by imputing guilt to an (‘alleged’) defendant in a criminal case, and so on. However, because it is impossible to catch all of these metapragmatic functions of the ‘joker’ under one hat, I prefer to wave my hands at terminology by simply labeling this elusive character (with homage to Fritz Lang) M for ‘metapragmatic.’

In this way, the right side of the schema symbolizes the elements that are present in the textual chain (the listing is of course not complete). Regarding the column to the left in **Figure 1** it should be read as a feature matrix whose cells can either be filled or

empty. If the latter is the case for all of the cells, the matrix renders the value zero (Ø).

In conclusion, let me quote a contemporary Chinese pragmaticist, talking about the ‘perlocutionary’ effect of speech acts. Yueguo Gu (1993: 428) remarked that “perlocution is not a single act performed by S[peaker]. Nor is its effect being caused by an utterance. It involves a [rhetorical] *transaction* (italics added).” This is, *mutatis mutandis*, what the current entry has been arguing for. Like perlocutions, pragmatic acts involve minimally not only a speaker and a hearer but also, in addition, a number of other factors. When all is said (illocutionarily) and not least (perlocutionarily) done, the ‘rhetorical transactions’ involved in speech acting rest on the assumption of the force of the utterance. This force is pragmatic, to wit: the force of the pragmeme.

Pragmatic Determinants of What Is Said

E Borg, University of Reading, Reading, UK

  2006 Elsevier Ltd. All rights reserved.

Imagine that Jack, pointing at a book on the table, utters the sentence "That is better than Jill's book." What, we might ask, is said by his utterance? Well, since the sentence contains a context-sensitive expression – the demonstrative 'that' – we know that determining what is said will require an appeal to the context of utterance to provide a referent (*see Indexicality: Theory*). Thus, this is one kind of pragmatic determinant of what is said by Jack's utterance. The sentence is also context sensitive in another, slightly less obvious, way: it is in the present tense, so an appeal to the context of utterance will also be needed to fix a time for Jack's claim. Finally, many theorists recently have argued that the sentence is also context sensitive in a third, much less obvious, way: for to grasp what is said by Jack it seems that we also need to know what kind of relationship he envisages between Jill and her book. Does Jack intend to say that the book he is demonstrating is better than the book Jill wrote, better than the book Jill owns, the book Jill is reading, etc? And what does he mean by 'better'

here – better written, better researched, better for standing on to reach a high shelf? Surely Jack says more than merely that the book he is demonstrating is better in some respect or other than a book bearing some relationship or other to Jill, but, if so, then any such additional information can only come from consideration of the context of utterance.

Furthermore – and this is where the current case differs from that of demonstratives and tense – it's not obvious that this last type of pragmatic determinant of what is said is traceable to any overt (i.e., syntactically represented) context-sensitive element. Jack's utterance does contain the syntactically marked possessive, but 's certainly doesn't appear on the list of usual suspects for context-sensitive expressions. And in many cases even this degree of syntactic representation is missing. Consider an utterance of "It's raining," where what is said is that it is raining at some location, or "You won't die," saying that you won't die from that cut, or "Nietzsche is nicer," meaning that Nietzsche is nicer than Heidegger. Or again, consider the speaker who produces a non-sentential utterance, e.g., pointing at a child and saying "George's brother," thereby conveying that this is George's brother. In all these cases we have additional

information contributed by the context of utterance yet which seems unmarked at the syntactic level.

These types of pragmatic determinant of what is said (i.e., contextually supplied information which is semantically relevant but syntactically unmarked) have come to be known as ‘unarticulated constituents’ (UCs). Such elements are extremely interesting to philosophers of language since they seem to show that there are problems with a quite standard conception of formal semantics, according to which the route to meaning runs along exclusively syntactic trails.

Now, as noted above, even in formal theories of meaning, like truth-conditional accounts, some appeal to a context of utterance must be made in order to cope with overtly context-sensitive expressions. However, the thought has been that this need not contravene the essentially formal nature of our theory, since the contextual instructions can be syntactically triggered in this case (crudely, the word ‘that’ tells us to find a demonstrated object from the context of utterance). Much more problematic, then, are pragmatic determinants of what is said which apparently lack any syntactic basis, for they show that context can come to figure at the semantic level regardless of whether it is syntactically called for (thus there will be no purely syntactic route to meaning).

In response to the challenge posed by UCs, advocates of formal semantics have sought to reject the idea that there are any such things as syntactically unrepresented but semantically relevant elements, claiming either that

1. every contextual element of what is said really is syntactically represented, even though this fact may not be obvious from the surface syntax of a sentence (i.e., there is more to our syntax than initially supposed), or that
2. any contextual contributions which are not syntactically marked are not semantically relevant (i.e., there is less to our semantics than initially supposed).

The first of these moves is pursued by a number of theorists who argue that, if one pays proper attention to all the information given at the syntactic level, one will find that many cases of supposedly syntax-independent semantic contribution are, in fact, syntactically required (see Stanley, 2000; Stanley and Szabo, 2000; Taylor, 2001; Recanati, 2002). Now, that there is some discrepancy between surface form and underlying syntax is a well-rehearsed point. For instance, Russell’s theory of descriptions invokes a clear distinction between surface form and logical form. Furthermore cases of so-called syntactic ellipsis (like the contraction in “Jack likes dogs and so does

Jill,” where the second sentence is held to have the underlying syntactic form “Jill likes dogs” despite its reduced verbal form) show that surface constituents may be poor indicators of syntactic elements. If this is correct, then the principle that there is more to our syntax than is apparent at first glance is independently well motivated.

Given this, there certainly seem to be cases in which (1) is an appealing response to putative examples of UCs. To give an example: someone might claim that, because an utterance of “Jack plays” can be used in one context to say that Jack plays the trombone and in another to say that Jack plays football, there must be a syntactically **unmarked**, contextual contribution to the semantic content of an utterance of this kind. However, closer inspection of the syntax shows this conclusion is dubious: ‘plays’ is a transitive verb requiring a subject and an object and, although the argument place for an object can be left unfilled at the surface level without this making the sentence ill formed, it might be argued that the additional argument place is marked in the underlying syntax of the verb. Since ‘plays’ is a transitive verb, the competent interlocutor will, on hearing “Jack plays,” expect to look to a context of utterance to discover what Jack plays, but this is precisely because she is sensitive to the syntactic structure of English in this case. Thus sometimes an appeal to an enriched syntax seems the best way to cope with putative UCs. However, there are also cases where (1) seems less compelling. For instance, in certain contexts, it seems that Jack can use an utterance of “The apple is red” to convey the proposition that the apple is red to degree *n* on its skin. Yet it is far from clear that the correct syntactic structure for color terms includes argument places for the shade, or precise manner of instantiation, of the color. Furthermore, the idea that syntactic structure can outstrip surface form at all (or at least in the ways required by [1]) has been rejected by some.

So, the opponent of UCs might seek to supplement (1) with (2), allowing that some contextually supplied information is not marked at the syntactic level but denying that such information is semantically relevant. The advocate of this kind of response wants to accept that, at an intuitive level, the speaker who utters “The apple is red” (or “You won’t die,” etc.) clearly does convey the contextually enriched proposition (i.e., that the apple is red on the outside, or that you won’t die from that cut) but that this is an instance of speaker meaning rather than semantic content (*see Semantics-Pragmatics Boundary*). Now, whether this move is warranted in all cases is again something of a moot point. One objection might be that it is a mistake to seek to separate speaker intuitions about what is said and claims of

semantic content to the radical degree predicted by this kind of move. So, for instance, it seems that the message recovered from an utterance of “That banana is green” will always be that that banana is green in some salient respect, but if this is the kind of proposition competent speakers can and do recover in communicative exchanges, shouldn’t this be what semantics seeks to capture? What role could there be for a more minimal kind of semantic content (e.g., which treats semantic content as exhausted by the proposition that that banana is green *simpliciter*)? (See Borg, 2004; Cappelen and Lepore, 2005, for attempts to answer this question.) A second worry for the formal semanticist who pursues (2) is that it may undermine her claim that semantics deals with complete propositions or truth-evaluable items. For instance, take the situation where the book Jack demonstrates is better than the book Jill is reading, but worse than the book she wrote. To assess Jack’s opening utterance as true or false in this situation, it might seem that we need first to determine what relationship Jack intended by his utterance of “Jill’s book.” Without this pragmatically determined aspect of what is said, it is argued, the sentence Jack produces is simply not truth evaluable, it doesn’t express a complete proposition (cf. Recanati, 2003).

Clearly, then, although the formal semanticist can respond to the challenge of UCs with moves like (1) and (2) it is not at all obvious that these responses are sufficient. However, we should also be aware that there are problems to be faced on the other side, by the proponent of UCs, as well. One major worry is how to preserve our intuitive distinction between semantically relevant elements and elements which are only pragmatically relevant. Given the traditional conception of formal semantics, the answer to this question was clear: something is semantically relevant if it can be traced to the syntax of the sentence, it is pragmatically relevant otherwise. Once we admit of semantically relevant but syntactically unmarked elements, however, this way of characterizing the distinction is clearly unavailable, so the proponent of UCs owes us some other account. If Jack utters “I’ve eaten” then it might seem plausible to claim that the semantic content of this utterance is that he has eaten breakfast today, but he might also succeed in conveying the messages that he has eaten a cooked breakfast within the last hour, or that he is not hungry, or any number of further propositions. How do we decide which elements come to figure in the supposed semantic content of the utterance, and on what basis do we rule some conveyed messages as merely pragmatic?

A further worry seems to be that, for each additional contextual contribution we introduce, this contribution is itself open to further qualification:

an utterance of “That banana is green” might intuitively be contextually enriched to that banana is green on its skin, but why stop here? Does the speaker mean to say that that banana is green all over its skin, that that banana is mostly green on a particular patch of skin, or that that banana is a bit green on this bit of surface skin and to a depth of degree *n* through the skin? The problem is that, for any piece of contextual information we introduce via a UC, this piece of information is itself likely to allow for a number of different contextual qualifications or sharpenings, and we seem to lack any principled reason to disallow these further sharpenings from appearing as part of the semantic content of the utterance. Yet, without such a reason, we run the risk of being launched on a slippery slope whereby the meaning of every utterance turns out to be a proposition which is somehow ‘complete’ in every respect. Yet no such conclusion seems palatable: it undermines notions of systematicity for meaning and makes it completely unclear how we ever come to learn and use a language given our finite cognitive resources.

So, it seems there are problems on both sides of the debate here and the question of how to handle pragmatic determinants of what is said remains a vexed one. The advocate of formal semantics needs to deliver an account both of overtly context-sensitive expressions – the indexicals, demonstratives, and tense markers of a natural language – and of the more covert kinds of context sensitivity discussed here. Reflecting on the multitude of ways in which a context of utterance can apparently affect issues of linguistic meaning certainly seems to show that the formal semanticist runs the risk of undervaluing the role played by pragmatic determinants in what is said. Yet it remains to be seen whether this constitutes merely a potential oversight on her behalf (cf. Stanley, 2000; Stanley and Szabo, 2000; Borg, 2004) or a fundamental failing of the whole approach (cf. Sperber and Wilson, 1986; Carston, 2002).

Pragmatic Indexing

M Silverstein, The University of Chicago, Chicago, IL, USA

© 2006 Elsevier Ltd. All rights reserved.

Indexicality is just the principle of contextualization of linguistic and other signs-in-use, seen as a component of the meaning of the occurring sign-forms. Indexicality is revealed in the way that, by degrees, linguistic and other signs point the users of these signs to the specific enveloping conditions in which they use them. Signs point to context in two ways: indexical signs link users to contextual conditions of which users have knowledge, independent of the occurrence of the particular indexical sign at issue; indexicals also link users to contextual conditions that, for those users, come into being only as a function of the occurrence of the indexical sign at issue (*see Context, Communicative*). For its users, the occurrence of an indexical sign is an event that, like a mathematical function, maps a context configured in a certain way into a context now configured in perhaps another way. Consider an expression, the use of which counts as an insult under particular, already mutually understood conditions. When it is directed as such to an addressee, once emerged in the interpersonal space between two people, its directed occurrence irreversibly transforms social relations so that much interpersonal work – further signs-in-use – might have to be undertaken, and things are never again quite as they were in the *status quo ante*.

The two contextualizing directions of indexicality – presupposing indexicality and creative or entailing indexicality (Silverstein, 1976; 1993) – are not, then, simply converse equivalents. They correspond to the two intuitions that sign users manifest, on the one hand about the 'appropriateness' of their messages to the momentary givens of the context as they

understand them, and on the other hand about the performative 'effectiveness' of their messages in bringing about intersubjective consequences in the contexts in which they communicate. For semiotic pragmatists, empirical study of indexicality investigates how actual messages, used on specific occasions of communication, relate to norms of appropriateness and effectiveness implicitly shared by users of the various sign modalities studied (*see Pragmatics: Overview*). Are there norms of 'who-can-communicate-what-message-to-whom-about-whom-or-what-under-what-conditions'? Are there norms of 'what-kind-of-act-is-performed-or-event-brought-about-in-the-communication-of-certain-message-forms'? How people use signs in actual event contexts can be interpreted only in relation to such norms; that is, events of how signs occur in their contexts of use can be studied as the medium through which social relationships among actual communicators are established, maintained, and transformed relative to the norms being invoked in actual practice.

Many writers, ancient and modern, have recognized and remarked on essentially this property of signs; the whole field of rhetoric in the Western tradition, we can see retrospectively, has been focused on it. It was Charles Sanders Peirce (1839–1914) who first systematized the concept of indexicality within a more encompassing framework of the semiotic (sign-based) foundations of all epistemology and ontology (*see Peirce, Charles Sanders*). Of all the grand – and ever unfinished – architectonic of his philosophy, Peirce's specific trichotomous distinction in which indexicality figures has been particularly influential for the analysis of cultural systems such as language. Peirce distinguished among *iconic* sign relationships (signs by resemblance or likeness to their semiotic targets), *indexical* sign relationships (signs of spatiotemporal or other

contiguity, including causal connection to another object, to which they point), and *symbolic* signs (implicit sign regularities, depending on general classificatory conventions that any instance of the sign invokes in use).

Many philosophers, logicians, and other students of cognition have considered how natural languages measure up against algorithmic systems invented for formally modeling the (normative, if not actual) coherence of human inferencing (what is sometimes termed ‘symbolic logic’). All have therefore been obligated to treat the pervasive fact of indexicality in natural languages, as language is the recognized human instrument for referring and predicating (Reichenbach, 1947; Bar-Hillel, 1954). Such accounts have at least recognized referential deixis, the way that objects of reference can be relationally located in respect of the – indexed! – contextual conditions under which an instance of a deictic form is used and to which it therefore points (*see Deixis and Anaphora: Pragmatic Approaches*). That is, every human language includes paradigms of grammatical forms (such as French *celui-ci* ‘this one [masc.]’ and *celui-là* ‘that one [masc.]’) that locate an object of reference in relation to its position in the (broadly speaking) ‘spatial’ configuration of the triad sender (speaker)–receiver (addressee)–referent in a communicational situation. In short, the ‘sense’ – the presumed-upon norm of form-meaning relationship – for such a deictic is a rule for the ‘appropriate’ use of each instance of the form to pick out a referent that conformingly co-occurs in the communicative context. All such systems of grammatical deixis impose upon instances of communication a kind of radial topology as a structuring principle, with various elaborations of a basic two-valued distinction (‘here’-and-‘there’ kinds of systems), as in Latin three-valued demonstrative paradigms, and with various generalized usage beyond the merely physical arrangement of an inhabitable speech context (for example, using deictics also to track the order of introduction of referents in the grammaticized topological flow of temporally unfolding discourse; cf. English *former* vs. *latter*).

Roman Jakobson (1896–1982), Emile Benveniste (1902–1976), and Jerzy Kurylowicz (1895–1978), however, among linguists, saw the pervasive role of indexicality in every natural language, far beyond mere deictic reference. The notion that every structure of what Saussure termed *langue*, or Chomsky termed ‘competence,’ was formally pervaded and functionally framed by Saussurean *parole*, or by Chomskyan ‘performance,’ was developed in Jakobson’s seminal *samizdat* of the annus mirabilis 1957, entitled *Shifters, verbal categories, and the*

Russian verb (Jakobson, 1971), in Benveniste’s series of papers of the same period, reprinted in his *Problèmes de linguistique générale* (1966, 1971), and in Kurylowicz’s generalizations from historical morphosyntactic studies of the Indo-European languages, beginning with his theories of ‘derivation’ (1936) and culminating in his *Inflectional categories of Indo-European* (1964; cf. 1960, 1972) (*see Jakobson, Roman*). At once, matters of context and its configuration came into view in the grammatical analysis of how people achieve even the simplest of communications in the way of grammatically formed referring and predicating: relying systematically on the minutest processing of details of context, such as role relationships of speakers, addressees, audiences, and referents, as manifested in categories of ‘person’; on presumptions of prior communicational events underlying warrants for speaking, as is manifested in categories of ‘evidentiality’; on differentiation of interests of speaker and addressee in the events being narrated, as manifested in the ‘epistemic’ differentiation of two planes of tense systems; and so forth. Peirce’s concept of indexicality was, then, generalizable beyond deictic reference as such to encompass the essentially context-dependent, context-suffused character of all linguistic communication and, more importantly, of anything one might term the structural norms for the referential and predication use of verbal signs.

In this light, it becomes clear that as modern linguistic anthropology developed by phases through an ‘ethnography of speaking’ (or ‘of communication’) (Gumperz and Hymes, 1964, 1972; Hymes, 1974; Gumperz, 1982), its concerns for the sociocultural contextualization of language use were the same as those of these European theorists of a *linguistique de la parole* (*see Linguistic Anthropology*). Similarly, the studies of social interaction following on the Chicago School symbolic interactionism within the discipline of sociology – Goffman’s (1967, 1969, 1974, 1981), those of ethnomethodology (Garfinkel, 1967; Cicourel, 1974), and conversation analysis (Sudnow, 1972; Levinson, 1983; Duranti and Goodwin, 1992) – are readings of the flow of interactional events achieved in the course of interpersonal co-participation in linguistically mediated communication (*see Conversation Analysis; Goffman, Erving; Interactional Sociolinguistics*). Intellectually, if not disciplinarily, it remained only to bring together all these interests to the study of actual language forms through the concept of the pervasive indexicality of the linguistic sign, and to understand the indexicality of language and its perilinguistic semiotic modes in terms congenial to the social and cultural analysis of situations of communication.

By so doing, contemporary linguistic anthropology (see Duranti, 2001, 2004; Silverstein and Urban, 1996) has been centered on the analysis of indexicality in every aspect of semiotic codes in use, and particularly of language: how does the flow of discourse, as it comes to cohesive textual form, indexically construe and construct relevant sociocultural framings of its producers (speakers, addressees, audiences, even analysts) and its denoted characters? Such framings are on the order of shared, or at least shareable, schematizations of identity (kinds of persons), of discourse genre (kinds of social occasions and events), of institutional space (kinds of allocated realms of access), and so forth. In the course of using language and such, communicative interlocutors locate themselves and others in such framings; the very forms they use among a language community's varied possibilities indexically project these framings as the understood conceptual surround of the current communication, making them relevant to its course and outcome. The way that the personnel of social interaction, as we might term them, come to be projectively located or positioned is a central part of the work of communication. Once they are so located, what goes on in the way of moving participants to new relative social locations, or of adding further, concurrent social locations to ones already presupposed, constitutes the dynamic indexical work of conversation. It is in this sense that much of the work of social identity is achieved and clarified in conversation, making it seem that aspects of social personae, like gender, class, and ethnicity, are 'performed.' When we view the matter as one of social indexicality, however, the real issue is not the normative existence of schemata of social classification, so much as the indexical clarity – in terms of directness vs. indirectness of indexation, ambiguity vs. discernibility, congruence vs. contradictoriness, etc. – with which particular individuals in particular kinds of interactional events come to be consequentially positioned in one or more of these frameworks. (For example, on gender as 'performed' in relation to other aspects of relational identities, see Silverstein (1985), Ochs (1992), Kiesling (2001a,b), Cameron and Kulick (2003), Eckert and McConnell-Ginet (2003), Bucholtz and Hall (2004), and Hastings and Manning (2004)).

Indeed, to a great extent, interactional moves seemingly concerned with denotational content, such as taking a contrary stand on something predicated by a conversational partner, or agreeing with the interlocutor while transforming the denoting terms of what seems to be agreed upon, are not really concerned with denotational content, or are concerned with it only residually. Rather, as conversational moves

doing interactional work, such discursive contributions dynamically index what is going on; they figure in the medium of denotational content acts of self/other repositioning within a relevant cultural framework indexically rendered 'in play' at such a point in interaction. In this way, 'other-mindedness' in respect of explicitly denoted content comes to count, implicitly and interactionally, as mutual counter-alignment of communicative participants in a social sense in a framework of identities and interests, whether momentary or with more perduring consequences of symmetric or asymmetric exclusion. All this social work, moreover, is generally accomplished only indexically, that is, entirely implicitly, and can therefore go officially unnoticed – it can even be plausibly denied – by participants, even if it materializes to indexical interpretation under the analytic lens of the student of interactional events.

Pragmatic Presupposition

Introduction

Both concepts – 'pragmatic' and 'presupposition' – can be interpreted in different ways. On the one hand, not being very remote from the intuitive, pretheoretical concept of presupposition as 'background assumption,' the concept of presupposition covers a wide range of heterogeneous phenomena. Owing to the principle of communicative economy as balanced by the principle of clarity (Horn, 1984), in discourse much is left unsaid or taken for granted.

In order to clarify the concept of presupposition, some authors have compared speech with a *Gestalt* picture in which it is possible to distinguish a ground and a figure. Presuppositions are the ground; what is actually said is the figure. As in a *Gestalt* picture, ground and figure are simultaneous in speech; unlike the two possible representations in the *Gestalt* pic-

ture, speech ground and figure have a different status, for instance with respect to possible refutation. What is said, i.e., the figure, is open to objection; what is assumed, i.e., the ground, is "shielded from challenge" (Givón, 1982: 101). What crucially restricts the analogy is the fact that discourse is a dynamic process, whereas a picture is not. At the same time that an explicit communication is conveyed in the ongoing discourse, an intertwined level of implicit communication is unfolding: understanding a discourse requires an understanding of both. When communicating, we are constantly asked to choose what to put in the foreground and what in the background. Discourses and texts are multilevel constructs, and presuppositions represent (at least a part of) the unsaid (*see Pragmatics: Overview*).

On the other hand, the label 'pragmatic' can be used in different ways. It may refer, first, to a number of objects of study and, second, to a number of methods of analysis linked by the fact that they take into account elements of the actual context (*see Pragmatics: Overview; Metapragmatics; Pragmatic Indexing;*

Indexicality: Theory). What is called ‘pragmatic’ may in fact be an expanded semantic object (see **Semantics-Pragmatics Boundary**). Generally speaking, a requirement for a truly pragmatic treatment seems to be that it is concerned more with real usages of language(s) than with highly abstract models dealing with oversimplified, construed examples. Ultimately, “what I can imply or infer, given a presupposition, depends on an active choice made in the face-to-face confrontation with my interlocutor” (Mey, 2001: 29).

The origin of the concept of pragmatic presupposition must be sought in the recognition by philosophers of language and logicians that there are *implicata* of utterances that do not belong to the set of truth conditions. Their starting point is the awareness that there are other relations between utterances besides that of entailment.

The definitions of pragmatic presupposition proposed in the 1970s have brought about a pragmatic rereading of a problem that was above all logical and that had not found adequate explanation in the available semantic theories. This rereading was basically methodological (see **Semantics-Pragmatics Boundary; Pragmatics and Semantics**).

From Stalnaker’s definition (1970) onward, a pragmatic presupposition was no longer considered a relation between utterances but rather was considered one between a speaker and a proposition. This is a good starting point, but it is far from satisfactory if the label ‘pragmatic’ is meant to cover more than ‘semantic and idealized contextual features,’ i.e., if we adopt a radical pragmatic standpoint.

Let us provisionally define a pragmatic presupposition as a *‘ménage à trois’* between a speaker, the framework of his/her utterance, and an addressee. From a radical pragmatic standpoint, a substantivist view of presuppositions – i.e., what the presupposition of an utterance is – is less promising than a functional, dynamic, interactional, contractual-negotiating view; the question here is how presupposition works in a communicative exchange. The pragmatic presupposition can be considered as an agreement between speakers. In this vein, Ducrot proposed a juridical definition whereby the basic function of presuppositions is to “establish a frame for further discourse” (1972: 94; my translation). Presuppositions are based on a mutual, tacit agreement that has not been given before and that is constantly renewed (or, as the case may be, revoked) during interaction. Presuppositions are grounded on complicity.

Having been the focus of lively discussions by linguists and philosophers of language during the 1970s, presuppositions seem now to have gone out of fashion. At the time, the “wars of presupposition”

(Levinson, 2000: 397) were fought between partisans of a semantic vs. a pragmatic view on the phenomenon. Another war is presently being fought with regard to another – though adjacent – territory, that of the intermediate categories covering the conceptual space between presupposition and implicature (see **Implicature**). The fight involves the overall organization of the different layers of meaning (and their interplay); it could be labeled the ‘war of (generalized) conversational implicature,’ if the latter term were neutral, rather than being the banner of the faction representing one side of the debate, namely the post-Gricean theorists (eminently, though not exclusively, represented by Levinson [2000]). The other side counts among its representatives, first of all, the relevance theorists, as represented by Carston (2002), who advance an alternative concept, called ‘explicature,’ that is intended to bridge the notions of encoded meaning and inferred meaning (see **Relevance Theory; Implicature**).

On the whole, the decline of the interest in presupposition as such can be understood, and partly justified, inasmuch as subtler distinctions between the different phenomena have been suggested, and a descriptively adequate typology of *implicata* is in the process of being built (see Sbisà, 1999b). The decline is less justified if the substitution is only terminological, that is, if the intuitive concept of presupposition is replaced by a gamut of theory-dependent concepts without offering any increase in explanatory power with respect to authentic data. In the latter case, it is not clear what advantages might result from the replacement of the umbrella term ‘presupposition’ by some other, more modish terminology. The point is, once again, the meaning we assign to the word ‘pragmatic’ and the object we make it refer to: either the rarefied world of construed examples or the real world, where people constantly presuppose certain things in order to reach certain goals.

Once it is clear that a radical pragmatic approach to the issue necessarily takes only the latter into consideration, the question is whether the term ‘presupposition’ refers to a range of heterogeneous phenomena or, on the contrary, to a particular type of *implicatum*, to which other types can be added. But even before that, we should ask whether, between the established notion of semantic presupposition and the Gricean notion of implicature (which, despite its popularity, still is under scrutiny by both philosophers and linguists), there is room for a concept like pragmatic presupposition. To answer this question, we need to say a few words on how pragmatic presupposition is distinct from the two types of adjacent *implicata* mentioned earlier: semantic presupposition and implicature.

Relation with Semantic Presupposition

The concept of semantic presupposition is relatively clear. Its parentage is accredited: Frege (see Frege, Gottlob (1848–1925) (01250)), Russell, Strawson. Its lineage seems to be traceable back to Xenophanes, quoted in Aristotle's *Rhetoric*, via Port-Royal and Stuart Mill. There is substantial agreement as to its definition: the presupposition of a sentence is what remains valid even if the sentence is denied; its truth is a necessary condition for a declarative sentence to have a truth value or to be used in order to make a statement. A respectable test has been devised to identify it – the negation test. There is a list of the linguistic facts (Levinson, 1983: 181–185) that trigger the phenomenon of presupposition: thirty-one have been listed, from factive verbs (e.g., *know*, *regret*; to change-of-state verbs (e.g., *stop*, *arrive*), to cleft sentences.

The notions of semantic presupposition and conventional implicature (see Maxims and Flouting), as identified by Grice (who exemplified the latter with *therefore*), can be unified to a certain degree, as both depend on a surface linguistic element that releases the presupposition. The difference between semantic presuppositions and conventional implicatures is that the latter, unlike the former, are irrelevant with respect to truth conditions (see Semantics-Pragmatics Boundary). In contrast, unlike semantic presuppositions and some conventional implicatures, pragmatic presuppositions are not directly linked to the lexicon, to the syntax, or to prosodic facts (e.g., the contrastive accent in 'MARY has come'; but are linked to the *utterance act* (see Pragmatic Acts).

We should distinguish types of *implicata* that are recorded by dictionaries and that either are part of the semantic representation of a lexeme or are conveyed by given syntactic or prosodic structures, from *implicata* that are independent of both dictionary and grammar: in particular, pragmatic presuppositions are triggered by the utterance and the speech act involved. They are presuppositions neither of a lexeme nor of a proposition nor of a sentence. They are presuppositions that a speaker activates through the utterance, the speech act, and the conversational or textual moves that a given speech act performs. Thus, pragmatic presuppositions concern not imperative *sentences* but orders; not declarative *sentences* but assertions; and so on. In other words, one ought to stress once more the distinction between syntactic and pragmatic functions: between them there is no one-to-one correspondence (see Lyons, 1977). The same linguistic structure, the same utterance, can perform different functions, convey different speech acts, and refer to different sets of presuppositions

(see Pragmatics and Semantics). The acknowledgment of a level of theorizing that goes beyond the sentence is the *sine qua non* for the analysis of pragmatic presuppositions. Pragmatic presuppositions are related to knowledge that is not grammatical but encyclopedic, that is, knowledge that concerns our being in the world (see Metapragmatics). Or, rather, they consist not in knowledge, in something that is already known, but in something that is *given as such* by the speaker, in something that is *assumed as such* and is therefore *considered irrefutable* (Van der Auwera, 1979).

Once we have recognized the semantic nature of lexical and grammatical (syntactic and prosodic) presuppositions, we should stress the connection between semantic and pragmatic presuppositions. First, the connection is of a general nature and concerns the obvious (but by no means negligible) fact that, when we are dealing not with abstractions but with real utterances, the phenomenon of semantic presuppositions becomes one of the available means by which the speaker can change the communicative situation (see Communicative Principle and Communication). If the link between, for instance, a certain lexeme and the presupposition it triggers is semantic, their analysis within an utterance and a context must face the pragmatic problem of their use and effects.

Second, on closer examination, this connection is bound up with the specific pragmatic functions performed by phenomena that can be labeled as *semantic presuppositions*. For instance, it is important to recognize the effectiveness of semantic *implicata* (lexical presuppositions, conventional implicatures, presuppositions linked to syntactic constructions such as cleft sentences, etc.,) both in the construction of texts and in the pragmatic strategies of manipulation of beliefs, or, to use Halliday's categories, both in the textual function and in the interpersonal one (see Systemic Theory; Halliday, Michael Alexander Kirkwood). On the one hand, the analysis of the different types of anaphora and their functioning whenever their antecedent is not what the preceding text stated but what it presupposed, has both textual and pragmatic relevance. On the other hand, precisely because it is shielded from challenge, communication *via* presuppositions lends itself to manipulatory purposes (see Sbisà, 1999a): suffice it to compare the different persuasive effects of an assertion embedded in a factive verb vs. a simple assertion (e.g., "People know that solar energy is wishful thinking" vs. "Solar energy is wishful thinking"). Having defined the semantic nature of the different types of presuppositional triggers, we should then recognize the role of pragmatics in the study of the production and interpretation of these

potentially highly manipulatory *implicata*. Obviously, it is more difficult to question something that is communicated only implicitly rather than to attack something that is communicated openly, if only because what is implicit must be recognized before it can be attacked. This is attested by the highly polemical and aggressive value inherent in attacks on presuppositions; such moves always represent a serious threat for ‘face’ (see Face; Mitigation).

Relation with Conversational Implicature

The criteria put forward by Grice to distinguish conversational implicature (see Cooperative Principle; Grice, Herbert Paul) from other *implicata* (i.e., calculability, nondetachability, nonconventionality, indeterminacy, cancelability) have not proven to be entirely satisfactory, even when integrated with the further criterion of ‘reinforceability’ (Horn, 1991). In particular, the criterion of cancelability, viewed as crucial by many authors, seems to be problematic (for a discussion, see Levinson, 1983). And in any case, cancelability is linked to the degree of formality of the interaction: in unplanned speech, it is easily tolerated.

If we are satisfied with an intuitive differentiation that nevertheless uses these criteria, we can reasonably maintain that pragmatic presuppositions are oriented, retroactively, toward a background of beliefs assumed to be shared. Implicatures, on the other hand, are oriented, proactively, toward knowledge yet to be built. Besides (at least if we prototypically think of *particularized* conversational implicatures, i.e., the kind that, according to Grice, strictly depends on the actual context; see Levinson, 2000: 16), such knowledge does not necessarily have to be valid beyond the real communicative situation. Thus, in order to distinguish the two types of *implicata*, the criteria of different conventionality (presuppositions being more conventional than implicatures) and of different validity (the latter being more general in the case of presuppositions, more contingent in the case of implicatures) are called into play. Presuppositions concern beliefs constituting the background of communication. They become the object of communication (thus losing their status of presupposition) only if something goes wrong, if the addressee does not accept them or questions them, forcing the speaker to put his or her cards on the table. Implicatures, on the contrary, concern a ‘knowledge’ that is not yet shared and that will become such only if the addressee goes through the correct inferences while interpreting the speaker’s communicative intention. The distinction is thus more a matter of degree than a true dichotomy, the latter, more than the former, requiring the addressee to abandon his or her laziness – the “principle

of inertia,” as Van der Auwera (1979) called it, i.e., the speaker’s reliance on shared beliefs – and to cooperate creatively with the discourse. With implicatures, a higher degree of cooperation and involvement is asked of the addressee (the more I am emotionally involved, the more I am willing to carry out inferential work) (see Arndt and Janney, 1987; see Cooperative Principle). Presuppositions can remain in the background of communication and even go unconsidered by the addressee without making the communication suffer. Implicatures must be calculated for communication to proceed in the direction desired by the speaker.

The roles of presuppositions and implicatures, seen against the backdrop of the speaker’s expectations and the discourse design, are therefore different; the former are oriented toward the already constructed (or given as such), the latter toward the yet to be constructed or, even better, toward a ‘construction in progress’: the former concern a set of assumptions, the latter their updating.

Presuppositions are more closely linked to what is actually said, to the surface structure of the utterance; implicatures are more closely linked to what is actually meant. Their respective degrees of cancelability also seem to be different: presuppositions are less cancelable than implicatures. This difference between presuppositions and implicatures with respect to the criterion of cancelability could be reformulated in terms of utterance responsibilities and commitment. With presuppositions and implicatures, the speaker is committed to different degrees – more with the former, less with the latter – with respect to his or her own *implicata*. Thus, a definition of pragmatic presuppositions could be formulated as ‘that which our hearer is entitled to believe on the basis of our words.’ In the case of presuppositions, this implicit commitment is stronger, and so, too, is the sanction, should the presupposition prove to be groundless. And the reason is that in the case of presuppositions, an attempt to perform a given speech act has been made: the linguistic devices have traced out, however implicitly, a detectable direction. The addressee is authorized to believe that the speaker’s speech act was founded, i.e., that his or her own presuppositions were satisfied. A character in Schnitzler’s *Spiel im Morgengrauen* implacably says to the second lieutenant who has lost a huge amount of money playing cards with him and does not know how to pay his debt: “Since you sat down at the card-table you must obviously have been ready to lose.” Communicating is somehow like sitting down at the card table: presuppositions can be a bluff.

The Gricean concept of implicature can be compared to Austin’s concept of perlocution (see Speech

Acts; Speech Acts, Classification and Definition; Austin, John L.), with which it shares the feature of nonconventionality: implicature is an actualized perlocution. From the utterance ‘My car broke down,’ I can draw a limited number of presuppositions, e.g., ‘there’s a car,’ ‘the car is mine,’ ‘the car was working before,’ but an indefinite number of implicatures, e.g., ‘Where’s the nearest garage?,’ ‘I can’t drive you to the gym,’ ‘Can you lend me some money to have it repaired?,’ ‘Bad luck haunts me.’

Finally, an interesting relationship is the symbiosis of pragmatic presuppositions and implicatures in indirect speech acts (see **Speech Acts; Pragmatic Acts**): the presuppositions of the act (preparatory conditions in particular) are stated or questioned so as to release a (generalized conversational) implicature (see **Implicature**).

Pragmatic Presuppositions: ‘Classical’ Definitions

Officially, at least, pragmatic presuppositions have had a short life. The available registry data on pragmatic presuppositions reveal the following: born 1970 (Stalnaker); died (and celebrated with a requiem) 1977 (Karttunen and Peters). The two latter authors proposed to articulate the concept of presupposition into (a) particularized conversational implicatures (e.g., subjunctive conditionals), (b) generalized conversational implicatures (e.g., verbs of judgment), (c) preparatory conditions on the felicity of the utterance, (d) conventional implicatures (e.g., factives, *even*, *only*, *but*). The reader edited by Oh and Dinneen (1979) can also be seen as a *post mortem* commemoration.

Against the backdrop of the inadequacies of the concept of semantic presupposition, Stalnaker (1970: 281) introduced the concept of pragmatic presupposition as one of the major factors of the context. Pragmatic presupposition enabled him to distinguish contexts from possible worlds; it was defined as a “propositional attitude” (see **Context, Communicative**). In the same paper, Stalnaker (1970: 279) also said that the best way to look at pragmatic presuppositions was as “complex dispositions which are manifested in linguistic behavior.” Confirming the equivalence between pragmatic presupposition and propositional attitude, Stalnaker (1973: 448) defined pragmatic presupposition in the following way: “A speaker pragmatically presupposes that B at a given moment in a conversation just in case he is disposed to act, in his linguistic behavior, as if he takes the truth of B for granted, and as if he assumes that his audience recognizes that he is doing so.” Stalnaker’s definition showed a tension

between the definition of pragmatic presupposition on the one hand as a disposition to act and on the other as a propositional attitude: pragmatic terms and concepts, such as ‘disposition to act’ and ‘linguistic behavior,’ were used alongside with semantic terms and concepts, ‘the truth of B’ in particular. In Stalnaker’s treatment (1970: 277–279), a narrow meaning of the concept of ‘pragmatic’ was associated with an extended meaning of the concept of ‘proposition,’ which was the object both of illocutionary and of propositional acts. This tension is still present and verges on a clash in Stalnaker (2002), where the most distinctive feature of the propositional attitude (which, according to Stalnaker, was constitutive of a presupposition) was defined as a “social or public attitude” (2002: 701).

Keenan, distinguishing between logical and pragmatic notions, defined pragmatic presupposition as a relation between “utterances and their contexts” (1971: 51): “An utterance of a sentence pragmatically presupposes that its context is appropriate” (1971: 49) (see **Context, Communicative**). In an almost specular opposition to Stalnaker, Keenan seemed to extend his view of pragmatics until it almost coincided with “conventions of usage,” as Ebert (1973: 435) remarked. At the same time, Keenan also seemed to hold a restricted view of the phenomenon of ‘presupposition,’ as exemplified by expressions that presuppose that the speaker/hearer is a man/woman (sex and relative age of the speaker/hearer), by deictic particles referring to the physical setting of the utterance and by expressions indicating personal and status relations among participants (e.g., French ‘*Tu es dégoûtant*’, literally, ‘You [informal] are disgusting [male]’).

Among other interesting definitions, there is the following one, offered by Levinson (1983: 205): “an utterance A *pragmatically presupposes* a proposition B iff A is *appropriate* only if B is *mutually known* by participants.”

Givón’s definition (1982: 100) articulated the prerequisite of mutual knowledge (see **Shared Knowledge**) more clearly: “The speaker assumes that a proposition p is *familiar* to the hearer, likely to be *believed* by the hearer, *accessible* to the hearer, within the reach of the hearer etc. *on whatever grounds*.”

Some conclusions are already possible. In particular:

1. The two definitions of presupposition as semantic and pragmatic (Stalnaker) or as logical and discursive (Givón, 1982) are compatible (cf. Stalnaker, 1970: 279).
2. Logical presupposition is a subcase of discursive presupposition: “logical presupposition is [...] the

marked sub-case of discourse backgroundedness” (Givón, 1984: 328).

One element occurs with particular frequency in the definitions – it is that of presupposition as ‘common ground.’ Here, the preliminary move from presupposition as propositional attitude to presupposition as shared knowledge (see **Shared Knowledge**), from the world of utterances to the world ‘*en plein air*,’ was Stalnaker’s (1973).

Now, both the narrow definition (presupposition as propositional attitude) and the extended one (presupposition as shared belief) involve a high degree of idealization. We are entitled to ask: What is common ground? What is shared knowledge? Is there a different ‘common ground’ for different communities of speakers? And to what extent and on the basis of what kind of conjecture, even within the same community, can we speak of ‘common ground’? Stalnaker (1974) realized the Platonic flavor of this notion when he gave examples of asymmetry in ‘shared knowledge’ (such as in his imagined conversation with one’s barber). According to Stalnaker, defining presupposition in terms of common knowledge worked “[i]n normal, straightforward serious conversational contexts where the overriding purpose of the conversation is to exchange information [...] The difficulties [...] come with contexts in which other interests besides communication are being served by the conversation” (1974: 201). But what are the criteria that define a conversation as ‘normal,’ ‘straightforward,’ and ‘serious’? Further, are there no other interests in play beyond those of exchanging information (such as are present in *every* conversation)?

Finally, it is worthwhile stressing that the concept of ‘common ground’ is effective only as a ‘*de jure*,’ not as a ‘*de re*,’ concept, i.e., not as something ontologically stated but as something deontically given by the speaker (Ducrot, 1972); that is, it represents a frame of reference that the hearer is expected to accept. On the one hand, a field of anthropological, sociological, and rhetorical investigation opens up before us. On the other hand, the characterization of presupposition as shared knowledge risks being static and idealizing and contains a high amount of ideological birdlime (see **Anthropology and Pragmatics; Context, Communicative**).

Pragmatic Presuppositions as Felicity Conditions

At this point, a few further remarks are in order. First of all, the classic presuppositional model is *semantic*; even when a notion of pragmatic presupposition is

invoked, what is in fact presented is no more than an analysis of some semantic phenomena. Pragmatic notions such as that of ‘utterance’ or ‘context’ (see **Context, Communicative**) are invoked with the main aim of avoiding the contradictions inherent in purely semantic models. The most refined treatment of pragmatic presupposition, by Gazdar (1979), did not escape this kind of contradiction. Second, an assertive model underlies the different definitions of pragmatic presupposition. A point of view centered on truth value is lurking behind allegedly pragmatic presuppositions: the concept of proposition (content of an assertion, whether true or false) is the relevant theoretical unit of measurement here. But can this theoretical construct work also as the pragmatic unit of measure? In particular, can this construct adequately deal with communicative behavior? Nothing seems to escape the tyranny of propositions, from the content of the actual utterance to mental content (which, if not presented in propositional form, assumes that shape after being embedded in a predicate like ‘know’ or ‘believe’), to a common or shared knowledge, and to the representation that a logician or a philosopher gives of that content. To what extent is the concept of proposition adequate here? Pragmatic presuppositions concern not only knowledge, whether true or false; they also concern expectations, desires, interests, claims, attitudes toward the world, fears, and so on. The exclusive use of the concept of ‘proposition’ is idealizing and in the long run misleading, especially when it gives rise to the restoration of the dimension of truth/falsehood as the only dimension of assessing an utterance, whereas this dimension is only one among many possible ones (see **Speech Acts, Classification and Definition**).

Neither is the pragmatic level homogeneous with respect to the other levels of linguistic description, such as syntax or semantics; it triggers other questions and anxieties. Pragmatic presuppositions are not a necessary condition to the truth or the falsehood of an utterance; rather, they are necessary to guarantee the felicity of an act.

Once we have abandoned the logico-semantic level of analysis, that is, once we have decided to consider the data of the real communication as our main object, the fact that Oedipus has killed his father is – prior to being an entailment or a presupposition of “*Oedipus regrets having killed his father*” – a shared knowledge common to a particular (Western) culture. “Perched over the pragmatic abyss” (Givón, 1982: 111), we feel giddy. Pragmatic presupposition could actually be God, or the autonomy of cats (of course, excepting the logicians’ cats, who, as is well known, invariably remain on their mats). But here the notion of presupposition is being spread so thinly as to

run the risk of becoming useless. There is, though, a narrower and more technical meaning of pragmatic presupposition that may help us build a protective wall at the edge of the abyss: it is that of pragmatic presuppositions as the felicity conditions of an illocutionary act.

Let us assume that the relevant unit for the concept of pragmatic presupposition is not the sentence nor the utterance, but the speech act in its entirety (see **Speech Acts and Grammar**). Pragmatic presuppositions can be regarded as felicity conditions or, if we adopt Searle's model, as constitutive rules (see **Principles and Rules**) of conventional speech acts (e.g., promises, requests, assertions). If a presupposition functioning as a felicity condition of the act does not hold, the act fails. (Note, incidentally, that a failure of a presupposition has different consequences with respect to a failure of an implicature; in fact, the failure of the latter has no bearing on the success or failure of the illocutionary act).

The identification of presuppositions with felicity conditions is not a new idea: "By the presuppositional aspect of a speech communication," argued Fillmore (1971: 276), "I mean those conditions which must be satisfied in order for a particular illocutionary act to be effectively performed in saying particular sentences. Of course, we need not be concerned with the totality of such conditions, but only with those that can be related to facts about the linguistic structure of sentences." For a pragmaticist, this definition is attractive in that it underscores the need to research systematic relations between utterance function and form. However, it cannot be accepted to the extent that felicity conditions necessarily are of a heterogeneous nature (*pace* Katz, 1977), in that they involve the extralinguistic world; in other words, they concern the place where language and world meet – the communicative situation.

Toward a Pragmatic Definition of Pragmatic Presupposition

A philosophical approach to the problem of linguistic action, seen as a kind of social action, was represented by Austin's typology of infelicities (1962). This was a step forward with respect to undifferentiated notions, such as that of 'appropriateness,' often used in the definition of pragmatic presupposition. Austin's typology helped distinguish between presuppositions without which the act is simply not performed (e.g., in promising somebody something that we do not have) and presuppositions that, if unsatisfied, make the act unhappy (e.g., in promising something insincerely). There are presuppositions whose satisfaction can be seen in binary

terms; in other cases, satisfaction occurs according to a scale, in the sense that the presuppositions can be more or less satisfied: the latter cases are the ones concerning the appropriateness of an act on which it is possible to negotiate (an order, however insolent, has been given; advice, although from an unauthoritative source, has been put forward, etc.). The role of nonverbal communication in the successful performance of acts has to a large extent still to be investigated: e.g., if someone offers me congratulations on my promotion, displaying a sad, long face, can I still say he or she is congratulating me (see **Gestures, Pragmatic Aspects**)?

In any case, the different types of infelicity help recall the substantial homogeneity of linguistic action to action: pragmatics must be connected to praxeology, to the study of actions as effective or ineffective, even before they can be considered true or false, appropriate or inappropriate (see **Pragmatic Acts**).

A decisive move in analyzing pragmatic presuppositions is that of connecting the typology of infelicities to empirical research on the functioning of linguistic and nonlinguistic interaction. For example, in conversation the typology can be related to the various mechanisms of repairs or, more generally, to research on misunderstandings in dialogue (for a survey, see Dascal [ed.], 1999) and on pathological communication (see **Conversation Analysis**). To achieve this more dynamic view of pragmatic presuppositions, it is crucial to consider presuppositions not only as preconditions of the act (e.g., as done by Karttunen and Peters, 1977) but also as effects: if the presupposition is not challenged, it takes effect retroactively. If you do not react against my order, you acknowledge my power; if you follow my advice, you accept me as an expert who knows what is best for you; if you do not question my assessment, you ascribe a competence to me (see, among others, Ducrot, 1972: 96–97).

The analysis of *implicata* still requires much theoretical and applied work. Some steps may be sketched out as follows. We can imagine the *implicata* of which pragmatic presuppositions are part, as types of commitments assumed by the speaker in different degrees and ways. The different degrees of cancelability according to which the types of *implicata* have been traditionally classified are related to a stronger or weaker communicative commitment: the speaker is responsible for the *implicata* conveyed by his or her linguistic act; if the addressee does not raise any objection, he or she becomes co-responsible for it. A decisive step is that of leaving behind the truth-functional heritage: rather than recognizing a presupposition as true, the issue is whether or not to accept it as valid.

In a pragmatic analysis of pragmatic presuppositions, it is furthermore necessary to consider the following dimensions:

1. *Sequential-textual and rhetorical* (Eco, 1990: 225). Presuppositional phenomena can be explained only by taking into account the cotextual sequential dimension (this was implicit, albeit in an idealized way, in Grice's criterion of cancellability), as well as the rhetorical dimension (which was implicit in Sadock (1978) and Horn's (1991) criterion of reinforceability). For a study of pragmatic presuppositions, it is necessary to move from an analysis of predicates within single sentences to the analysis of textual structures in which the presupposition is one of the effects (*see Text and Text Analysis*). Presuppositions change the legal situation of speakers (Ducrot, 1972: 90ff.), that is, their rights and duties within a context that is being constructed along the way. The projection problem (*see, among others, Levinson, 1983; van der Sandt, 1988*) – namely, the problem of how the presuppositions of a simple sentence are or are not inherited from a complex sentence – may be reformulated in a pragmatic and textual perspective as a problem of the constraints, not only thematic, on coherence and acceptability that arise in the construction of a discourse (*see Constraint, Pragmatic*).
2. *Anthropological-cultural-social*. Much work has still to be done on shared knowledge, on the kinds of beliefs that can be taken for granted within a given cultural and social group. Presuppositions are a way of building up such knowledge and of reinforcing it. The social relevance of this research, which might be profitably connected to work in the theory of argumentation (e.g., *see Perelman and Olbrechts-Tyteca's classical analyses [1958]*) is obvious. As Goffman (1983: 27) wrote: "[T]he felicity condition behind all other felicity conditions, [is]... *Felicity's Condition*: to wit, any arrangement which leads us to judge an individual's verbal acts to be not a manifestation of strangeness. Behind *Felicity's Condition* is our sense of what it is to be sane" (*see Social Aspects of Pragmatics*).
3. *Psychological*. The analysis of implicit communication, even if one takes care to avoid undue psychologizing, does require psychological adequacy. Just an example will clarify this point: we tend to choose those topics that are at least partially shared, that enable us to be allusive and elliptical; we produce 'exclusive' utterances that only the addressee can understand at once. In other words, we engage the maximum of

knowledge shared between ourselves and (only) the addressee.

The pragmatic analysis of presuppositions is a task that, for the most part, still has to be performed. It is a truly vertiginous enterprise, yet one that cannot be abandoned if, moving beyond the logical relations between utterances, human communication is to be considered a relevant object of study.

Pragmatics and Semantics

Critical Introduction: Metatheoretical Presuppositions as Ideological Norms Constraining the Empirical Sciences of Pragmatics and Semantics

As a first approximation, pragmatics may be defined as the science of language use (*parole*) or the discursive functions of language, including its contextual uniqueness and variability (irregularities), whereas linguistics may be defined as the science of the abstract (decontextualizable) regularities that constitute linguistic structure (*langue*), including semantics as a formally encoded system of denotational meanings.

This is a very general and common characterization of pragmatics and semantics that, however, may not be universally accepted by linguists and pragmatists; among them, there is no consensus on what those fields are about, where the boundaries lie, or even whether we can or should draw boundaries (see *Pragmatics: Overview*). At the same time, most scholars nonetheless seem to think that the relationship between semantics and pragmatics is a primary metatheoretical issue, having direct and profound bearings on how things are done in these disciplines, that is, how we conceptualize the relationship constitutes primary principles, norms, or postulates at the metatheoretical level, explicitly or implicitly presupposed in the context of any scientific practices concerning language at the object level. Such metatheoretical presuppositions clearly constrain

object-level activities and analyses (see **Metapragmatics**). Here, we may think of how meta-level phenomena such as Gricean maxims and frames are indexed by object-level phenomena such as floutings and contextualization cues, respectively, and relatively strongly constrain the interpretations of what is done in the speech event in which such phenomena occur (cf. Lucy, 1993; Mey, 2001: 173–205; see **Maxims and Flouting; Constraint, Pragmatic; Grice, Herbert Paul**). Note that such metatheoretical principles are, in social-scientific terms, evaluative norms to which the individual scientists differentially orient and against which they evaluate their behaviors; in so doing, they discursively mark their distinct group identities and constitute themselves as members of particular ‘schools’ (cf. Woolard and Schieffelin, 1994; Koyama, 1999, 2003; Kroskrity, 2000). Thus, these value-laden, normative conceptualizations of the relationship between semantics and pragmatics may be seen as the metalinguistic ideologizations that index the social positions and stances of particular scholars. Below, we describe the general frameworks of such ideologizations, place them in a historical context from the perspective of critical pragmatics, and examine what language users, including semanticians and pragmaticians, do with words, that is, how they (re)create their theories, disciplines, and themselves in their sociohistorical contexts (cf. Koyama, 2000b, 2001a; Mey, 2001).

Because metatheoretical conceptualizations may focus on methodological stances or the more empirical issue of how to set the boundaries of pragmatics (*vis-à-vis* semantics or ‘extralinguistics,’ i.e., semanticism, complementarism, and pragmaticism), we shall, for analytic purposes, deal with them separately. Starting with the former, we show the correspondences between metatheoretical conceptualizations and the sociohistorical contexts that endow them with socially interested values.

Three Methodological Stances to Pragmatics and Semantics

The Componential View

The first way to articulate the relationship concerns methodologies of, or metatheoretical stances toward, linguistic sciences. Clearly, they can be objective (de-agentivized) or subjective (agentive), analytic (compositional) or synthetic (holistic), or various combinations thereof; but we may detect three ideal types in the recent history. The first of such types, best represented by the Chomskyan approach and generally characterized by objective and analytic attitudes, is called

‘componential,’ ‘compartmental,’ or ‘modular.’ It sees the linguistic sciences as analytic pursuits dealing with decomposable objects (i.e., modules) such as phonetics, phonology, morphophonology, morphology, syntax, semantics, and pragmatics, naturalistically studied by compositional methods and described independently of the particular sociohistorical contexts in which analysts are involved as social agents. Clearly, this metatheoretical stance, which underlies the organizational institutions and academic curricula of linguistics, is typical of the modern sciences coming out of Baconian natural philosophy in 17th-century England (cf. Bauman and Briggs, 2003). That is, it is the stance of the modern natural sciences (*Naturwissenschaften*), with their laws and other regularities, which try to explain empirically occurring phenomena by appealing to hypothetically idealized quasiempirical regularities (‘covering laws’) analytically abstracted from the total contexts of scientific activities, which are thereby decomposed into distinct fields, in our case semantics and pragmatics.

This epistemological characterization may be supplemented with a pragmatic understanding of the social and historical processes of epistemic authorization (cf. Kroskrity, 2000: 85–138). That is, the componential stance toward language is pragmatically positioned in, and presupposingly indexes, the historical context of the post-Baconian specialized sciences and, more broadly, Durkheimian ‘organic society’ in modernity, or the age of social specialization and the division of labor. Because the truthfulness, appropriateness, and effectiveness of any actions, including scientific ones, depend on the contexts in which they take place, this implies that the componential stance and its ‘scientific’ results receive their authority primarily from the post-Baconian modernization project. This project is characterized not only by social and epistemic specialization, but also by the standardizing regularization, methodical rationalization, and experimental controlling of contextual contingencies, chance happenings, and unique events, which earlier were understood as fate, epiphanies, and other phenomena originating in the heavenly universe, and transcending the sublunar, empirically manipulable space of human agency (cf. Hacking, 1990; Owen, 1994; Koyama, 2001b). Here, we must note that standardizing regularization, Saint-Simonian technocratic specialization, and Benthamite instrumental rationalization generally characterize the modern discipline of logic (or, when applied to linguistics, of formal syntax and semantics), which came to dominate American philosophy around 1900 and whose rise is precisely due to these social forces (cf. Kuklick, 1977).

The Perspectival View

The second stance is less objectivizing and more synthetic because it emerged as a critical reaction to the crisis of the Baconian sciences and the modernization project in the early 20th century. This critical reaction may be characterized as the Husserlian phenomenological movement, genealogically going back to Hegel's totalistic dialectic phenomenology and Kant's critical philosophy and encompassing some of the early structuralists, Gestalt psychologists, and other (broadly defined) neo-Kantians who emphasized the processual nature of scientific knowledge as empirically anchored in the holistic context of human beings in their worlds, with their origin located at the *hic et nunc* of agentive experiences (cf. Jakobson, 1973). One of the critical aspects differentiating this stance from the nomothetic one of the natural sciences is the understanding of scientists and their activities as a contextually integrated part of the phenomena analyzed by the scientists themselves, here theorized as contextualized beings. Hence, the phenomenological sciences are closer to a *Geisteswissenschaft* such as Weberian interpretative sociology, in that it tries to come to grips with the dialectic fact that scientists, always already involved in their social contexts, cannot ever get rid of socially contextualized perspectives (cf. Geuss, 1981; Duranti and Goodwin, 1992). Hence, the phenomenological stance toward the linguistic sciences is characterized by a perspectival and ethnomethodological (i.e., critically agentive) understanding of such sciences, in particular the understanding that language can be studied from an objectivizing or agentive perspective and that scientific findings are largely a function of the particular methodological perspectives chosen by social agents (cf. Calhoun *et al.*, 1993; Verschueren, 1999; note the perspectivalist notion of 'seeing-as,' genealogically derived from Wittgenstein's, Nietzsche's, and Kant's epistemological focus on form, epistemology, and methodology rather than on substance, ontology, or the *Ding an sich*). In this understanding, semantics studies the linguistic phenomena that emerge when scientific agents take a deagentivizing, decontextualizing perspective, whereas pragmatics is a study of linguistic phenomena seen from the perspective of 'ordinary language users' who nonetheless critically examine **their own** linguistic activities 'from within.' Hence, pragmatics in the phenomenological tradition is a critical science **of, by, and for** ordinary language users (cf. Mey, 2001).

Here, we may note that the perspectival view is generally preferred by pragmaticians, presumably because 'perspective' is a pragmatic notion *par*

excellence, whereas the componential view is preferred by semanticists. This suggests that analytic decomposition is a methodological action that displaces or suppresses perspectival indexicality, compartmentalizes linguistic sciences, and privileges (or generates) structural objects such as semantics, in opposition to pragmatics, which it relegates to the 'waste-basket' of linguistics (cf. Mey, 2001: 19–21).

The Critical Sociological View

The previously discussed methodological understanding of the sciences goes back to Kant's transcendental critical philosophy; it was the turn-of-the-century neo-Kantians, in particular, Weber, Adorno (the Frankfurt School), and other critical sociologists, who, following Nietzsche, came to squarely understand this methodological, Kantian condition of modern sciences and its consequences, especially its epistemological relativism (cf. Geuss, 1981; Owen, 1994; Mey, 2001: 315–319). More importantly, such scientists followed the critical spirit of Kantian philosophy and launched a **metacritique** of methodologically critical Kantian science and its relativism, shown to reflect and partially constitute the contextual, social condition of the age in which such science had been created, viz., modernity. In this metacritical view, what is needed is a metacritical science that can relate the critical methodological instances of Kantianism to their sociohistorical context – that is, the political-economic and other kinds of pragmatic 'reality' that have endowed these instances with plausibility, if not verity – so as to show the critical limits of methodological relativism that are inherent in its historical and societal context.

Thus, just as methodologically critical perspectivism and its sociological metacritiques (i.e., critical pragmatism) came out of Kantian critical philosophy, so, too, pragmatics itself and, at least in part, semantics evolved out of this philosophy. This is illustrated by the following brief excursion into the historical context in which these two fields originated.

First, we note that the term 'pragmatics' was coined by the American pragmatist Charles Morris (1901–1979), who articulated the tripartite distinction among syntax (form), semantics (meaning), and pragmatics (context), appealing to the semiotic Pragmati(c)ism of Charles Peirce (1839–1914), which tried to base knowledge on *praxis* (actions). Peirce's Pragmati(c)ism, characterized by the phenomenological and critical orientations of neo-Kantianism, explicitly pointed to Kant as the founder of critical sciences, primarily because Kant articulated philosophy as a **critique**, in particular of philosophy itself. Hence, post- or neo-Kantians advanced 'semantics'

and ‘pragmatics’ as means to critically examine and articulate the foundations of modern epistemological and praxeological pursuits, respectively. More importantly, the contextual motivations for these critical sciences came from the historical conditions of the Enlightenment (or early modernity), which replaced the older schema in which *ratio* was subordinated to *intellectus* (emanating from the heavens to the sub-lunar human world, which was passively affected by it) with a new schema in which reason (epistemology) came to preside over imagination, fancy, or even madness (aesthetics). This was part of the comprehensive historical shift that replaced the theocentric, religious universe of the late Middle Ages – in which the universal, catholic, and absolute truth resided in the heavens, transcending the empirical, earthly, contingent, relative, human universe – with the anthropocentric, secular universe of modernity, in which human beings became empirical and transcendental (i.e., autonomous) subjects, no longer relying on the once transcendental heavens for their existence. By the same token, philosophy became anthropocentric and relativistic too, as the sciences of, by, and for humans (cf. Foucault, 1973; Koyama, 2001b, 2003; see Foucault, Michel). This transformation followed the development of commerce in Europe from the 12th–13th centuries onward, which brought together radically diverse cultures and histories, thus eventually giving rise to (1) the relativistically skeptic philosophy of Descartes, which started with doubting; (2) the speech genre of travel journals (developing into modern novels and (Alexander) Humboldtian ‘natural histories,’ out of which emerged modern anthropology and comparative sociology); and (3) humanism (eventually turning into philology and linguistics). The relativistic social and epistemic condition of modernity is correlated with the historical transfer of transcendence from the heavenly realm to the empirical realm of humans, who thus became transcendental-empirical doublets, obliged to justify themselves by means of, precisely, such metalinguistic critiques as semantics, pragmatics, and, more generally, Kantian transcendental philosophy.

Thus, modern semantics and pragmatics came out of Kantian critical philosophy and show historical characteristics of modernity, whereas philosophy (science) tries to critically examine and justify – within limits – itself because there is no longer any God (or *deus ex machina*) available to ground the human-made edifice (cf. Vico’s *scienza nuova*). Post-Kantian modern semantics carries out a metalinguistic (meta-semantic) critique of scientific and nonscientific languages, concepts, and (correct and literal) referential acts (cf. logical positivism, General Semantics, and the work of Ogden and Richards), whereas pragmatics

(often incorporated into the social sciences, in the tradition of Durkheim, Weber, Boas, Marx, Hegel, the brothers Humboldt, Herder, and ultimately, Kant) carries out a metalinguistic (metapragmatic) critique of scientific and nonscientific discourses and other actions in the sociohistorical context of modernity and beyond. This is what the post-Kantian demand of critical science requires us to do, by reflexively examining post-Kantian sciences **themselves**, including semantics and pragmatics, and articulating their historical, cultural, social limits as shown by (1) the decontextualized, dehistoricized notion of ‘truth’ advanced by the semanticists who ethnocentrically assume their cultural stereotypes as universal concepts; (2) the modern anthropocentric, ‘phonocentric’ understanding of discourse as having its foundational origin in the *hic et nunc* of microsocial communication; and (3) methodological relativism (cf. Koyama, 1999, 2000b, 2001b, 2003).

Thus, the third, critical-sociological, view tries to transcend modern perspectivalism and methodological relativism by showing their historical limits and advancing a transcendently ideal **total** science that attempts to integrate a legion of specialized sciences and perspectives, in particular trying to overcome the division between the theoretical (conceptual, analytic, and linguistic-structural) and the pragmatic (empirical, social, and contextual) (cf. Koyama, 2000a). This approach, which underlies Pragmati(c)ism as a project seeking to anchor theoretical knowledge in contextualized actions, and pragmatics as a project aimed at the unification of theoretical and applied linguistics, can be called ‘semiotic,’ insofar as semiotics is a science that tries to integrate decontextualized and contextualized epistemic, praxeological, **and** aesthetic phenomena, separately studied by specialized sciences, under the unitary umbrella of semiotic processes anchored in the pragmatics of social actions and events. In this view, it is the socially embedded discursive interaction that contextually presupposes or even creates the variety of perspectival stances assumed by social agents such as linguistic scientists and language users. Thus, this view is less agentivist than the phenomenological one in that it tries to articulate the contextual mechanisms that give rise to agentive, perspectivalized, and ideologized accounts and uses of language. Such a ‘discursive-functional’ approach was advanced by Peirce, Sapir, Whorf, Jakobson, Bateson, Hymes, and other semioticians, one of the most important frameworks being Jakobson’s (1960) model of the six functions of (linguistic) communication: the referential, emotive, conative, phatic, poetic, and ‘metalingual’ (metalinguistic, metacommunicative) functions (see Jakobson, Roman). The critical

significance of this framework is that it is a model of linguistic phenomena reflexively including itself (cf. Lucy, 1993; Mey, 2001: 173–205): Any linguistic theorizing or understanding, be it explicit or implicit, whether carried out by professional linguists or ordinary language users, can be characterized in terms of the metalinguistic (metasemantic and metapragmatic) functions of discursive interaction. In this model, semantics is characterized as the metasemantic function of discursive interaction, that is, the system of the symbolic signs that discursive interactants believe exist prior to the discursive interactions in which those signs are presupposingly used to interpret the referential ‘meanings’ (what is said) of such interactions; on the other hand, pragmatics is equated with discursive interaction, encompassing all six functions, including the metasemantic function (to which pragmatics in the narrow sense is opposed) and the metapragmatic function, that is, the principles, maxims, norms, and other reflexive devices for textualization (framing, intertextual *renvoi*, and Bakhtinian voicing) that language users such as linguists use in order to regiment, interpret, and create referential and social-indexical meanings (i.e., effects) in discursive interactions (see **Principles and Rules; Dialogism, Bakhtinian**). In the next section, we articulate the relationship between semantics and pragmatics in this critical view, specifically in relation to the boundary problem.

The Boundary Problem

As has been noted, we may articulate the relationship between pragmatics and semantics in terms of the empirical boundaries between them and between pragmatics and extralinguistics. Obviously, how we distinguish semantics from pragmatics may significantly affect how we delimit pragmatics from ‘the beyond,’ and conversely.

Semanticism

First, as to the boundary between semantics and pragmatics, we may discern three approaches: semanticism, pragmatism, and complementarism. Semanticism envisions pragmatics as the extension of semantically encoded yet metapragmatically characterizable categories (especially moods and *verba dicendi*, or verbs of saying), just as traditional logic has understood pragmatics (discourse) as the extensional universe onto which intensional (i.e., metasemantically characterizable) categories are projected. Naturally, semanticism is aligned with the decontextualized, analytic methodological perspective and sees language in use from the metasemantic perspective of the denotational

code (linguistic structure) presupposingly used by language users, including linguistic scientists, to interpret the referential significances of discursive interactions in which they are involved as discourse participants. Hence, this approach, typically taken by the philosophers of language such as Austin and Searle, characteristically uses the method of ‘armchair’ introspection, in which only the presupposable (and referential) aspects of communicative processes may readily emerge. This approach generally excludes the social-indexical aspects of pragmatics, particularly as regards group identities and power relations among discourse participants and other contextual beings, inasmuch as these are **created** (vs. presupposed) in discursive interaction and only coincidentally, indirectly, or opaquely related to linguistic-structurally encoded symbols (cf. Lucy, 1992; Mey, 2001). In this approach, pragmatics is mostly reduced to metapragmatically characterizable types in what essentially is a semantic, denotational code; examples are mood/modality/tense categories, verbs of saying, pronouns, and other shifters (i.e., ‘denotational-indexical duplexes’; cf. Lee, 1997) or their psychological correlates, as observed in Austin’s ‘performative utterances’ and Searle’s ‘primary illocutionary forces,’ allegedly underlying the perlocutionary effects regularly created by the indirect (nonliteral) use of the tokens of such types (see **Deixis and Anaphora: Pragmatic Approaches; Speech Acts; Austin, John L.**). Hence, this approach can be characterized as denotationist, universalist, and presuppositionalist; it is based on, and expresses, a consensualist linguistic ideology adopted by the scientific agents who, like many other language users, are inclined to see only or primarily the denotationally explicitly characterizable parts of language (cf. Lucy, 1992), while their social interest is limited to seeing language *in vitro* (vs. *in vivo*), essentially consisting of a set of universal categories commonly presupposed rather than contextually created in discursive interaction (cf. Mey, 2001). Historically, this ideology derives from the 17th-century Lockean ideas about language and communication that started to prescribe and advocate, against the rhetorical practices of Scholastic disputants and the radically egalitarian Puritans, the transparently referential (‘correct and literal’) use of language based on the ‘universal public (i.e., bourgeois) consensus’ about the proper, cooperative, rational use of language that should be presupposed by ‘anyone’ (in reality ‘Modern Standard Average Middle-Class Man’; cf. Silverstein, 1985; Bauman and Briggs, 2003).

Complementarism

Unlike semanticism, complementarism advocates the coexistence of semantics and pragmatics as ‘different

but equal' disciplines. Hence, it is compatible with both the compartmental and perspectival methodologies, as well as with the general ideologies of modern liberalism, relativism, and specialization. This may partially account for the current popularity of this approach, at least since the demise of the more ambitious projects of Generative Semantics and Searle's semanticism in the 1970s (cf. Koyama, 2000b). The approach, espoused by mainstream pragmatists such as Leech (1983) and Levinson (1983), has its roots in Grice, who set up the uniquely pragmatic Cooperative Principle to delimit and save the symbolic realm of logico-semantics from the caprice of contextual variability and irreducible contingency (*see Cooperative Principle*). As this indicates, insofar as complementarism tries to construct a kind of pragmatic theory that complements the semantic theory of decontextualized signs, it is inclined to focus on pragmalinguistics, that is, the aspects of pragmatics adjacent to and compatible with semantics, such as the universal principles, maxims, and other regularities of language use that can be fairly transparently linked to propositions and other referential categories. Thus, complementarism may be characterized as a weak version of semanticism that does not try to reduce pragmatics to semantics but attempts to create a pragmatic correlate of semantic theory, as witnessed by the affinity between Searle's semanticist doctrine of indirect speech acts and Grice's complementarist doctrine of implicature or, more fundamentally, by the referentialist, universalist, rationalist, and consensualist characteristics shared by traditional semantics and the pragmatic theories advanced by Grice and Levinson.

From Complementarism to Pragmaticism

Nonetheless, complementarism is distinct from semanticism insofar as the former advances a uniquely pragmatic principle (or perspective). This principle (or perspective) is communication, a notion that conceptualizes discursive interaction as opposed to linguistically encoded semantic categories (even though communication is still often taken as the intentional correlate of semantic categorization). This shift from decontextualized code to contextual process is also observed in the robustly pragmatic understanding of presupposition that has emerged in the wake of Karttunen's complementarist distinction between 'semantic' and 'pragmatic presuppositions' (cf. Mey, 2001: 27–29); in the discursive-functional model of communication, presupposition is a fundamentally pragmatic contextual process rather than an essential property of semantic types or their tokens. Discursive

interactions indexically presuppose and create their (con)texts, yielding contextual appropriateness and effectiveness, both in the referential and social-indexical domains of discourse. The focus of pragmatics is thus on the discursive interactions that indexically create referential and social-indexical texts by indexically presupposing contextual variables, including but not limited to metalinguistic codes such as metapragmatic principles and metasemantic relationships (*see Pragmatic Presupposition*).

Thus, complementarism may lead to the kind of pragmaticism that tries to include semantics as a part of the all-encompassing pragmatic processes of presupposing and creative indexicality in both referential and social-indexical dimensions, involving not just ordinary language users but also linguistic scholars and including not just linguistic but also extralinguistic (sociohistorical) domains. There is, however, another, reductionist kind of pragmaticism, which is actually a variation of complementarism that narrowly limits the realm of pragmatics and exclusively deals with the part of pragmatics that correlates with semantics – the area of referentially focused pragmatic regularities. For instance, in Relevance Theory, the dialectically indexical processes of presupposing contextualization and creative textualization in discursive interactions are theorized exclusively from the referentialist perspective that tries to relate 'what is said' (referential text) to 'what is meant' (rather than to 'what is done'), the gap between the two being bridged by the ideological assumption that discursive participants universally share the rationalistic and consensualist notions of economy, cooperation, and regular and eufunctional communication (cf. Mey, 2001: 179–181). Hence, this approach excludes the vast realm of pragmatics dealing with social conflicts in group identities and power relations, as well as historically contextualized contingent happenings, which can always defeat regularities and other contextual presuppositions and create different presuppositions and texts (cf. Auer and Luzio, 1992; Koyama, 2001a) (*see Relevance Theory*).

Historical Contextualization of the Ideologies of Pragmatics and Semantics

Thus far, we have explored how the three methodological stances are related to how we define the disciplinary boundaries and noted the correspondence between the methodological scale, stretching from componentialism to perspectivalism to critical pragmaticism, and another scale, extending from semanticism to complementarism, reductionistic pragmaticism, and total pragmaticism. Like any ideology, this configuration of

metalinguistic ideologies is also embedded in the sociohistorical context; thus, we may observe a historical drift of pragmatics from componentialism and semanticism to perspectivalism and complementarism and, finally, to total and critical pragmaticism (cf. Koyama, 2001b).

Again, let us start with Kant's critical turn, which yielded two traditions: the semantic and the social scientific (i.e., pragmatic). Whereas Kant's central concerns were '(re)cognition' and 'judgment,' behind which the problematics of 'meaning' and 'language' were still hidden (cf. Coffa, 1991), Frege's (1848–1925) later discovery of predicate logic replaced the Kantian notion of synthetic judgment (or value) with analytic logic and the notions of 'proposition' and 'sentence,' further divided into 'force' (assertoric, interrogative, imperative, and so on) and propositional content (represented by structurally decomposable units such as the subject, predicate, and their subcategories). This led to the birth of modern semantics, as it came to be pursued by Russell (1872–1970), Carnap (1891–1970), Tarski (1902–1983), and Quine (1908–2000), as well as by the linguistic formalists of the Copenhagen and the Neo-Bloomfieldian Schools, whose impressive successes allowed the componential semantic tradition to penetrate into more empirical disciplines such as psychology and anthropology, where 'ethnoscience' came to flourish in the mid-20th century (see **Anthropology and Pragmatics**). Moreover, the semantic traditions of Carnap and the Neo-Bloomfieldian structural linguists, especially Harris (1909–1992), converged in Chomsky (1928–), whose generativism began to dominate linguistics in the 1960s, when the semantic tradition moved more deeply into the empirical fields, thereby giving rise to empirical semantics, as witnessed by the rise of Generative Semantics, fuzzy logic, and Rosch's prototype semantics in the late 1960s to mid-1970s, eventually congealing into today's cognitive linguistics.

Such was the evolution of the branch of the post-Fregean semantic tradition that focused on propositional content. In contrast, the other branch, focusing on 'force,' was developed by the Ordinary Language Philosophers, starting with Austin, who translated Frege's *œuvre* into English, to be followed by Searle, Grice, and others (see **Grice, Herbert Paul**). This branch is usually called 'pragmatics,' but (as we have already seen) it is actually a kind of empirical semanticism, dealing with pragmatic matters only insofar as they can be systematically related to propositions or referential texts ('what is said'; see **Pragmatics, Overview**).

In the early days, modern pragmatics was dominated by Speech Act Theory and by Gricean thinking:

It was practiced by extending the methodological orientations of logic and structural linguistics, with their focus on denotational regularities. In those quasipragmatic theories, contingent occurrences of actual language use were still theorized as tokens of some regular Searlean type of speech act (or speech act verb) or some Gricean postulates (principle and maxims) rather than as indexical events presupposingly contextualizing other indexical events, indexical event types (e.g., speech genres, sociolects, and dialects), and symbolic structures and contextually creating certain pragmatic effects (cf. Auer and di Luzio, 1992; Koyama, 2001a) (see **Pragmatic Indexing**). In short, the notions of context and contextualization, which constitute the core of our pragmatic understanding, were yet to be given full theoretical significance, especially in comparison with the anthropological tradition, which, since the days of Malinowski and Sapir, has focused on the (socially situated) 'speech event' (cf. Gumperz and Hymes, 1964; Duranti and Goodwin, 1992; Duranti, 2001; see **Context, Communicative**). Thus, it was only in the late 1970s and 1980s, when anthropology and linguistic pragmatics began to influence one another more intimately, that the genuinely pragmatic view of 'pragmatics' as the idiographic, ethnographic, historiographic science of contextualization started to emerge. Then, it became clear that the (con)text indexed by language in use ('what is done') includes not just 'what is meant' (i.e., the part of the context that may be regularly related to 'what is said'); rather, the context of language in use is primarily captured by social-indexical pragmatics dealing with 'what is done,' that is, with the power relations and group identities of discourse participants, involving their regionality, class, status, gender, generation, ethnicity, kinship, and other macrosociological variables, indexed and actualized in microsocial speech events to entail some concrete, pragmatic, 'perlocutionary' effects (see **Power and Pragmatics**). The changing focus is reflected, first, in the move from the early quasipragmatic theories, which generally embraced the componential view and focused on illocutionary and other propositionally centered referential pragmatic regularities in microsocial speech events, to the next generation of more full-fledged pragmatic theories, which based themselves on the perspectival view, paying attention to the social-indexical (especially cultural) aspects of pragmatics as well. Further, the changing focus is also observed in the more recent move toward a 'total pragmatics,' with its critical view and its emphasis on the (micro- and macro-)contextual aspects of pragmatics. These aspects focus especially on a social-indexical

pragmatics (including not just culture but also class, gender, and other sociological and historical variables) that views as its core 'what is done' (the pragmatic, *praxis*), a special subset of which is constituted by 'what is said' (referential practice) and by linguistic structure, including semantics (as presupposingly indexed in referential practice) (cf. Koyama, 2000a, 2000b, 2001a; Mey, 2001). Only then can semantics and pragmatics be united in their proper contextualization within the macrosocial historical matrix.

Pragmatics of Reading

J L Mey, University of Southern Denmark,
Odense, Denmark

Introduction

Reading is a matter of communication. Not just in the usual sense that an author has a message to communicate to a reader (a story, the description of an experiment, an opinion about an event, and so on), but the reader also communicates with the author by showing interest in the story, by ratifying the experiment described, by approving of the opinion proffered, and so on. This ‘active communication’ is often expressed in writing or orally (e.g., by talking about the story to others, by commenting on the experiment, or by writing a commentary to the editor of the paper or journal in which the author’s opinion had appeared). Usually, though, readers ‘vote with their eyes’, silently, by simply sharing their precious time with authors and entering into a readerly relationship with them – a relationship that starts when prospective readers acquire the authors’ written product (a book, scientific journal, etc.).

Prospective readers become real readers by *negotiation*. More will be said on this later; for the moment I simply emphasize the fact that negotiation involves people (here, author and reader), and essentially happens on the basis of some common *language*. Readers must be able to understand the language used by authors – not just in the sense of a common ‘national’ language, but also with regard to the different levels of expression and local and professional idioms. Readers’ reactions are also expressed in language (internally, by ‘following’ authors’ narrative paths, or externally, in the form of oral or written comments). Moreover, in all of this, we must not forget the environment in which both readers and authors are situated: their social *context* is what makes mutual understanding and communication possible (see **Context, Communicative**).

Reading, as a communicative process, relies on the presence of users in a social context – a context mediated by language. In other words, reading can be characterized as a *pragmatic* process, involving “the study of the use of language in human communication as determined by the conditions of society” (Mey, 2001: 6) (see **Pragmatics: Overview**).

Negotiation and Reading

In all reading, there is negotiation. Authors have to persuade readers to take the story seriously, to

enter the ‘fictional space’ (Mey, 1994). To do this, the author ensures that whatever is said in the story will be taken at ‘story value’ by the readers, and that no hitches will develop in the smooth spinning of the narrative yarn. When this condition is not fulfilled, the texture of the story is disrupted: a hole appears in the narrative fabric or a ‘clash of voices’ occurs (Mey, 2000) (see **Literary Pragmatics**).

Authorial persuasion displays parallels with another kind of negotiation, the business deal: one puts certain things on the table (an offer, a counteroffer, conditions, etc.), while other matters are held back, kept ‘under the table’ (sometimes even after the deal is concluded). To buttress one’s argumentation in the negotiation process, one must produce evidence of credibility: previous contracts, a reputation, ‘goodwill’, concrete enticements (such as money, again often under the table), and above all, a proof of trustworthiness based on one’s credentials as a serious negotiator. These proofs can more or less subtle; less subtle are outward appearance such as the right kind of business attire; personal accouterments showing status (watch, jewelry, tie, correct hair styling including – if applicable – facial hair, etc.; even such minor things as flying the right airline in the right class can be important); the right language to bring to the negotiation table; correct manners; and most of all, a thorough knowledge of the matters to be discussed. In all this, as Dr Chester Karass incessantly admonishes us: “In business you do not get what you deserve, but what you negotiate.”

There are similarities between business negotiation and creating contracts between author and reader. The author has to speak the ‘right’ language (in the sense of: appropriate to the occasion). That is, the narratorial voice and the voices of the characters should be balanced, both with each other and between themselves (for details, see Mey, 2000). But also, the author should be knowledgeable about what is on the narrative negotiation table: the voice of the text should be credible, as regards the factual circumstances of the narrative. Details about times and places should accord with the facts as they are familiar to both author and readers; alternatively, the details should be such that the readership can live with them for the duration of the narrative. The latter requires author and reader to negotiate, as we will see in the following.

Negotiating the Scene

The details of time and place mentioned above belong to a metaphorical ‘scene.’ In it, characters play their

roles, and utter their lines; their scenic location in time and place makes their roles trustworthy and their voices credible. Similarly, the characters of a story have their particular roles and voices, recognized as authentic and consistent by the readership. The scene thus is both the condition for, and the result of, a successful reader-author relationship (*see Literary Pragmatics*).

If an author invites us into an unfamiliar scene, possibly remote from our own (as in many historical novels or in modern science fiction), negotiation is necessary to make the unfamiliar authentic: the strange world into which the author introduces us should not be unacceptably strange. We are all 'strangers in a strange land,' but we are supposed to stay inside this "ambiguous territory" (as Julio Cortázar (1985) puts it), at least during the narration, and not run away, scared by unfamiliar surroundings and technological innovations.

Often, such innovations and strange environments are projections from familiar situations and technologies which now appear distorted or exaggerated. People travel with the speed of light in *A hitchhiker's guide to the galaxy*; men have menstrual periods in Ursula Le Guin's *The left hand of darkness*; banal objects such as eyeglasses become sophisticated prosthetic body parts able to tell the time, access databases, and orchestrate weaponry, as happens in William Gibson's *Neuromancer*; and so on. If successful, such 'defamiliarizing' features strengthen the ties between author and reader; the 'bestrangement' that occurs is a powerful factor in the negotiation discussed above.

'Bestrangement' and Reader's Role

Above, we saw how the success of a literary text depends upon readers accepting and voluntarily entering the 'scene' created by the author. One way to overcome the readership's reservations is to make the fictional world attractive by appealing to readers' sense of familiarity and normativity ("those people are just like us"). Another, far more powerful, way to intrigue readers is to make things difficult or to titillate readers with special narrative effects. Especially important is 'bestrangement', which exploits unfamiliarity and disregard for narrative conventions. It is based on a 'willful suspension of disbelief' (in Samuel Taylor Coleridge's classic formulation; 1817, 1956), an acceptable and accepted infraction of the rules as normal authorial behavior. At the same time, this infraction is what makes a 'bestranged' piece of literature interesting.

As Shklovskij put it, to see things as they are, we need to escape the 'tyranny of the ordinary,' the

established ways of viewing the world as codified through language, especially its literary and poetic varieties. The phenomena of the outside world reveal their true identity only if seen with a stranger's eyes. Conversely, we may be able to grasp things as they are in themselves by transforming into strangers and outsiders. The point is to *see* the world, not just to recognize it: art re-creates our experience of the world and its objects, causing us not just to register and recognize them but to see them. Shklovskij (1917: 14; my translation) declares that "Art does this by 'bestrangement': by making things unfamiliar, by making their shapes hard to recognize and 'strange'."

The importance of changing perspective has long been recognized by visual artists. The contemporary Danish painter Per Kirkeby, writing about his 19th century colleague N. A. Abildgaard, says: "At intervals the earth has to be made flat in order that we may see clearly" (Kirkeby, 1993: 14). But the perspective has to be grounded in an acceptable context; the scene must be 'natural' (even though not necessarily naturalistic, in the common sense of the word). This includes the characters and their roles, as expressed in dialogue, both the one that is verbally expressed and the underlying, invisible subtitles that are left to the readers' imagination and co-creative activity (*see Dialogism, Bakhtinian*).

Negotiating the Fictional Space

Perspective and Change

How does a competent or 'versatile' (Tsur, 1992) reader deal with changes of perspective in literary texts? Three questions may be asked:

- (1) What happens when an author disturbs the temporal and spatial fabric of the story?
- (2) What are the author's aims in making the reader lose touch with normal, perceived reality?
- (3) In what ways and to what extent does the author realize those aims?

The first question is about the technique of 'bestrangement' in fiction, as discussed above.

The second question touches on the author's need to establish the scene or fictional space as an independent world where normal relations of time and space may be suspended. The reader must see the normal reality as abnormal and the deviant reality of the fictional space as normal.

The third, more general, question deals with how a fictional space is built up by the characters playing out their roles on the fictional scene, and by the intricate interplay of the voices that express the characters' stance toward, and participation in,

the fictional reality. As for the readers, they enter the fictional scene *qua* readers, and participate in the world-building by expressing themselves in a 'readerly voice,' manifesting their active cooperation in the textual process.

Disturbing Reality

The initial negotiation in the 'act of reading' (Iser, 1982) is implicit in the act of buying or borrowing a book; continuing negotiation depends on our perseverance as 'competent readers' (see Tsur, 1992; Mey, 2000).

During our reading, the implicit contract will have to be renewed: either by our continued reading, or by an explicit move. Here, we may distance ourselves from the text (physically, by discarding the book, or mentally, by losing interest or stopping reading); alternatively, we may get so involved in the story that we start inhabiting the fictional space as if it were a real one. Our 'bestrangement' may express itself in a feeling of dislocation, as when we wake up in unfamiliar surroundings and don't know where we are or how we got there. The world may have been changed so that we see its true reality, as when we contemplate a surrealist painting.

A prime example of this process is found in a famous scene from *Anna Karenina*. Returning by train from Moscow to St. Petersburg, after the ball at the Oblonskij palace and her spectacular dance with Vronskij, Anna is reading a trashy English story about a young nobleman and his aspirations to a manor and a baronetcy. Realizing that she is getting involved in the silly story, Anna experiences a sense of shame, and closes the book.

The hero of the novel had already started on the path toward achieving his English happiness, a baronetcy and a manor, and Anna wanted to join him in his journey toward that manor, when she suddenly realized that he ought to be ashamed, and that she ought to be ashamed likewise. But what [should] he [be] ashamed of? "And what [am] I [to be] ashamed of?" she asked herself in irritated wonder. (*Anna Karenina*, I: xxix, p. 114 in the 1962 edition; translation mine.)

Like many readers, Anna enters the 'fictional space' and participates in the novelistic life on stage. When readers 'identify' with a particular hero or heroine in a story, they do so actively, with their "whole body and deeds," as Bakhtin says. They can also give notice, and 'cancel' the reading contract, by either putting away the book, or assuming a critical stance toward it.

Anna, however, cannot escape the powerful hold of the fictional space she has entered. In the end, her

identification with the hero's world, including the feeling of shame, turns out to be grounded in the real world: her burgeoning love for Vronskij, whom she then goes out to meet on the platform when the train makes the next stop.

A further, particularly gripping illustration of Anna's entering the fictional scene and participating in it, more or less against her will, comes later in the chapter. Here, Anna finds her thoughts wandering from the text she is reading, to her own, actual situation. This slipping is not simply a matter of Anna being preoccupied, having her thoughts elsewhere; rather, it is her entry into the fictional space of the novel that forces Anna into a dialogue with her own self, with her 'inner' voice, on a theme only partly suggested to us (and to her) by the text. Anna reviews her pleasant memories of the dance and of Vronskij's tender loving face. Suddenly, a new feeling surges up.

But at the same time, at exactly the same spot in her remembering, a feeling of shame made itself strongly felt; as if an inner voice, precisely whenever her thoughts went back to Vronskij, told her: "Hot, very hot, burning." "So what of it?" –

she said to herself peremptorily, sitting up in her chair. – "What on earth does this mean? Am I perhaps afraid to look this thing straight in the face? Then what of it? How should there be, how could there be, between me and this stripling officer, any other relations than I would have with any normal acquaintance?" She let out a contemptuous laugh and went back to her book, but this time she was totally unable to concentrate on her reading. She took the paper cutter and drew a line on the window pane, then put its smooth, cool surface to her cheek and could barely refrain from bursting out in cries of joy – a joy that, coming from nowhere, suddenly engulfed her. (*Anna Karenina*, I: xxix, 1962 ed., p. 114; my translation.)

Anna is overcome by a near-hallucinatory state of euphoria. At the end of the chapter, the series of intense emotional experiences culminates in her finding herself on the station platform of 'Bologov' (actually, Bologoye Tver' province), where her famous, and fatal, encounter with Vronskij is about to happen.

Anna's reading of her trashy novel is 'set up' (Mey, 2001: 211–212) by her circumstances after the initial meeting with her future lover. Dialoguing with the text, Anna is engaged in what I call a *pragmatic act* of reading (Mey, 2001: 252ff) (see **Pragmatic Acts**). This is most clearly seen in the passage above where Anna, as reader, actually is engaged in a kind of parlor game with an 'inner voice,' telling Anna that she is getting "[h]ot, very hot, burning," ever closer to

discovering the true nature of her confused state of mind and lack of concentration: she is in love.

This discovery, of course, does not result from the act of reading as such. Still, the text, in its dialogic foreplay with Anna as reader, does lead up to the real thing: her textual immersion results in a sexual de- or even re-construction. Anna's hidden emotions and the recognition of her true feelings are lying in waiting just outside her novel's fictional space. As soon as she puts the book away and leaves its fictional space, having symbolically cut her textual ties by drawing a line on the compartment window with her paper-knife (a metaphoric 'text cutter'), she crosses a physical threshold by leaving the compartment and exchanging her fictional space for the real world: text for sex. It is in this real space, physically materialized as the storm-blown, snow-covered railway platform at 'Bologov', that the textually de-constructed, sexually re-constructed Anna meets Vronskij in what Bakhtin has called an "open-ended dialogue of life," with the well-known consequences that form the backbone of the dramatic plot for which Tolstoy's novel is justly famous (see Bakhtin, Mikhail Mikhailovich).

Does the Reader Have a Voice?

In all this, the role of the reader, as an active participant in the building of the story world, through 'creative reading' has yet to be determined, but the reader's role presupposes a 'readerly voice' in the orchestration of the text. When discussing literary activities around text, we focus on authors but often gloss over the important role of the reader. Readers approach the text with a particular set of pre-conditions which, from a reader's point of view, make the text possible; there is no reader's text without a reader, because stories describe *possible* worlds, not actual occurrences: only readers can bring these possibilities into existence.

Speaking on the general conditions of novelistic work, the Czech author Milan Kundera has remarked:

A novel examines not reality, but existence. And existence is not what has occurred, existence is the realm of human possibilities, everything that man can become, everything he's capable of. Novelists draw up the *map of existence* by discovering this or that human possibility. But again, to exist means: "being in the world." (Milan Kundera, *The art of the novel*, p. 42.)

Only through the intermediary of an actually existing reader can the text achieve *existence*. A text, taken by itself, is merely an author's product, and as such only realizes a *possibility* – one out of the many

ways of 'being in the world' that a text assumes by being consumed by a reader (see **Literary Pragmatics**).

Certain schools of literary criticism have emphasized a so-called 'objective' approach to text understanding and analysis. In this view, the text, the whole text, and nothing but the text should be the target of our investigation (see Mey, 1994 for a critique). To see the limitations of this kind of approach (usually referred to as 'New Criticism'), consider the following passage from a contemporary novel by Jay McInerney, *Brightness falls*:

[The talk here is about money; the context is that of the attempted hostile takeover of a New York publishing house by another firm. The manager of the threatened enterprise is speaking.]

Nobody *pays* for anything anymore, that's the fucking problem. They're totally leveraged. Bridge loans, junk bonds, whatever. The money's out there. Money's cheap. The banks used to be like convent girls, you couldn't get a feel without a marriage license. Then Drexel started to practically give it away, and now they've all got red lights on over the door. (McInerney, 1992: 217; emphasis original.)

The excerpt describes the United States in the late 1980s, when the world of finance was characterized by an expanding money market with no real assets to back it up (cf. "junk bonds"). Buying something big without having the money was possible if you had "leverage," that is to say, you were able to find some of the ("cheap") money you needed, waving your hands at the rest. You could borrow the money, preferably on borrowed, or even fake, collateral. All this was because the banks had a cash glut: interest to wealthy overseas depositors had to be paid on time, so the money was "practically given away," even to less than serious borrowers.

The text is distinguished by an intricate use of composite metaphors, appealing to the (mostly) male sexual experience: 'convent girls,' 'feel,' 'marriage license,' 'red lights.' But many respectable firms became players in this risky game (such as "Drexel," the since failed Wall Street broker firm of Drexel Burnham Lambert).

The point to note here is that reading such a text requires active, understanding, co-creative readers who are at least aware of the way American males of a certain type regard their female counterparts, and where sexual activities are mainly configured in terms of finance: buying and selling, negotiating a deal, and so on. The reader's participation in the textual process is necessary for it to be understood properly, or understood at all. This is why texts from earlier periods or far-away cultures often strike us as insipid

or totally opaque. Conversely, even nonfictional texts exhibit some of the same characteristics as fictional prose.

For example, Stanley Kauffman concludes a scathing movie review with the innocuous remark: “The suggestion in the title [of the film] is off target” (Kauffmann, 1973: 41). Because the reader has been informed earlier in the review that the title is *Up the sandbox* (National General, 1972), the reader is obliged to supplying the missing reference and provide the proper ‘target.’ This is made possible by the author’s implicit appeal to the reader to identify certain common vulgar English expressions containing a propositional phrase *Prp* + *NP*, where the *Prp* in this particular case is *up*, while the *NP* is (*{the, yours, ...}* + *N*), where *N* stands for (*Body Part* [+*Intimate*]). The competent reader will rise to the challenge posed by the author’s unfinished expression, thus actively taking part in the creation of the fully fledged piece of text.

Conclusion

As Scholes (1982) remarks, we cannot add to the facts of a story (just as we normally cannot ‘do’ anything with the objects in a painting or the parts of a sculpture). However, we can place the facts in their proper environment: we can extend the story into other stories, especially our own, and into the stories that we are familiar with from our reading. As Scholes says, “As semiotic interpreters we are not free to *make* meaning, but we are free to *find* it by following the various semantic, syntactic, and pragmatic paths that lead away from the words of the text” (1982: 30; italics in original).

The reader who is thus able to “find meaning” in the text (the *Lector in fabula*, Eco, 1979) is also a *co-creator* of the text. To collaborate with the author, readers follow the “various syntactic, semantic, and pragmatic” paths that lead into as well as “away from ... the text.” Readers who can do this are competent or ‘versatile.’ In particular, competent readers work with the author to construct the ‘fictional space’ in which the characters play their roles to create, not a dead letter, but a living text re-created in the reader.

This reader-author relationship is a relation of mutual influence. If reading can be called a game, it is one in which each side’s moves are affected by and affect those made by the other; it is a play in which all the players have a voice, including the reader.

Pragmatics: Linguistic Imperialism

R Phillipson, Copenhagen Business School,
Copenhagen, Denmark

© 2006 Elsevier Ltd. All rights reserved.

The study of linguistic imperialism focuses on how and why certain languages dominate internationally, and on attempts to account for such dominance in an explicit, theoretically founded way. Language is one of the most durable legacies of European colonial and imperial expansion. English, Spanish, and Portuguese are the dominant languages of the Americas. In Africa, the languages of some of the colonizing powers, England, France, and Portugal are more firmly entrenched than ever, as English is in several Asian countries.

The study of linguistic imperialism can help to clarify whether the winning of political independence led to a linguistic liberation of Third World countries, and if not, why not. Are the former colonial languages a useful bond with the international community and necessary for state formation and national unity internally? Or are they a bridgehead for Western interests, permitting the continuation of a global system of marginalization and exploitation? What is the relationship between linguistic dependence (continued use of a European language in a former non-European colony) and economic dependence (the export of raw materials and import of technology and know-how)? In a globalizing world, has English shifted from serving Anglo-American interests into functioning as an instrument for more diverse constituencies? Or does U.S. dominance in the neoliberal economy constitute a new form of empire that consolidates a single imperial language?

Imperialism has traditionally been primarily concerned with economic and political aspects of dominance (Hobson, 1902). Later theorists have been concerned with analyzing military, social, communication, and cultural activities, and the underlying structures and ideologies that link powerful countries, the 'Center,' with powerless countries, the 'Periphery,' and the structure of exploitation from which rich countries benefit and poor countries suffer (Galtung, 1980). Resources are distributed unequally internally within each country, which has its own Center and Periphery, which in Marxist analysis is seen in terms of class (Holborrow, 1999) (*see Class Language*). Linguistic imperialism was manifestly a feature of the way nation-states privileged one language, and often sought actively to eradicate others, forcing their speakers to shift to the dominant language. It was also a feature of colonial empires, involving a deeper degree of linguistic penetration in settler countries (e.g., Canada, New Zealand) than in exploitation and extraction colonies (e.g., Malaya, Nigeria).

Linguistic imperialism presupposes an overarching structure of asymmetrical, unequal exchange, where language dominance dovetails with economic, political, and other types of dominance. It entails unequal resource allocation and communicative rights between people defined in terms of their competence in specific languages, with unequal benefits as a result, in a system that legitimates and naturalizes such exploitation (Phillipson, 1992) (*see Minorities and Language and Linguistic Decolonization*).

Linguistic imperialism can be regarded as a subcategory of cultural imperialism, along with media imperialism (e.g., news agencies, the world information order), educational imperialism (the export of Western institutional norms, teacher training, textbooks, etc., and World Bank policies privileging Center languages in education systems; Mazrui, 2004), and scientific imperialism (e.g., dissemination of paradigms and methodologies from the Center, which controls knowledge about the Periphery). Linguistic imperialism may dovetail with any of these, as for instance when English as the dominant language of science marginalizes other languages, English as 'Lingua Tyrannosaura' (Swales, 1997; Ammon, 2001; Phillipson, 2002).

The mechanisms of linguistic imperialism are documented in works that link linguistics with colonialism (Calvet, 1974 refers to linguistic racism, confirming the interlocking of 19th century philology with European racist thought), relate the promotion of English in educational 'aid' to the economic and political agendas of Center countries (Phillipson, 1992), and discuss the effect of literacy on the local language ecology, including the role of missionaries (Mühlhäusler, 1996). Linguistic dominance has invariably been buttressed by ideologies that glorify the dominant language: as the language of God (Arabic, Dutch, Sanskrit), the language of reason, logic, and human rights (French over several centuries), the language of the superior ethnonational group as advocated by (imperialist racism, German in Nazi ideology), the language of modernity, technological progress, and national unity (English in much postcolonial discourse). A Ghanaian sociolinguist describes linguistic imperialism as

the phenomenon in which the minds and lives of the speakers of a language are dominated by another language to the point where they believe that they can and should use only that foreign language when it comes to transactions dealing with the more advanced aspects of life such as education, philosophy, literature, governments, the administration of justice, etc. . . . Linguistic imperialism has a way of warping the minds, attitudes, and aspirations of even the most noble in a society and preventing him from appreciating and realizing the full potentialities of the indigenous languages (Ansre, 1979: 12).

There are studies that focus on the discourses accompanying linguistic hierarchies (Pennycook, 1994), and the ambivalent role of English in contemporary India (Rajan, 1992). English in Africa is seen as “an imperial language, the language of linguistic Americanization, a language of global capitalism, . . . creating and maintaining social divisions serving an economy dominated primarily by foreign economic interests and, secondarily, by a small aspiring African bourgeoisie” (Mazrui, 2004: 30, 40, 52), though English is simultaneously appropriated for Afrocentricity in Africa and in the United States. The tension between the need to learn English for local empowerment alongside local languages, and the adequacy of our theories for addressing these issues has been explored (Canagarajah, 1999, several contributions in Ricento, 2000) (see **Power and Pragmatics**).

Fishman *et al.* (1996) is an anthology on *Post-Imperial English: Status Change in Former British and American Colonies, 1940–1990*, with contributors from many countries, who were asked to assess linguistic imperialism in each context. The editors see the need for English to be “reconceptualized, from being an imperialist tool to being a multinational tool English . . . being postimperial (as the title of our book implies, that is in the sense of not directly serving purely Anglo-American territorial, economic, or cultural expansion) without being postcapitalist in any way.” Fishman, in a ‘summing-up and interpretation’ of the contributions to the book, correlates the status of English with hard data on the use of English in the media, education, studies abroad, technology, administration, etc., and more subjective assessments. He tabulates the degree of ‘anglification’ in each state. His assessment is that the “socioeconomic factors that are behind the spread of English are now indigenous in most countries of the world” and that the continued spread of English in former colonies is “related more to their engagement in the modern world economy than to any efforts derived from their colonial masters” (1996: 639). Fishman seems to ignore the fact that ‘engagement in the modern world’ means a Western-dominated globalization agenda set by the transnational corporations, the International Monetary Fund, and the World Trade Organization, with the U.S. military intervening whenever ‘vital interests’ are at risk. Although some contributors conclude that linguistic imperialism is not present, they have no difficulty in using the concept in country studies, and none question its validity or utility.

Others are more robust in distancing themselves from a linguistic imperialism approach, when reassessing the language policies of the colonial period and in theorizing about the role of English in the modern

world (Brutt-Griffler, 2002) and when describing the global constellation of languages (de Swaan, 2001), on which see Phillipson (2004). English plays a supremely important role in the ongoing processes of globalization, which is seen by some scholars as synonymous with Americanization. English is playing an increasingly prominent role in continental European countries and in the institutions of the European Union, though in principle and law these are committed to maintaining linguistic diversity and the equality of the languages of the member states (Phillipson, 2003). Increased European integration and market forces are, however, potentially leading to all continental European languages becoming second-class languages. This concern has led to the advocacy of Europe-wide policies to strengthen foreign language learning, but few European states (probably Sweden and Finland are those most active) have elaborated language policies to ensure the continued strength of national languages alongside competence in English and full respect for linguistic human rights (see **Linguistic Rights**).

One symptom of market forces is the major effort by ‘English-speaking’ states to expand their intake of foreign students. Higher education is increasingly seen as a market opportunity, a sector that the British government seeks to expand by 8 per cent per year between 2004 and 2020. The British economy benefits by £11 billion directly and a further £12 billion indirectly (British Council). Over half a million foreign students attend language schools in Britain each year. The English Language Teaching business is of major significance for the British economy. These figures reveal something of the complexity of the supply and demand elements of English as a commodity and cultural force. They also demonstrate the need for the analysis of linguistic dominance to shift from a colonial and postcolonial perspective to contemporary patterns that are maintained by more subtle means of control and influence, language playing an increasingly important role in the internationalization of many domains.

Thus in the teaching and marketing of ‘communication skills,’ a shift from linguistic imperialism to communicative imperialism can be seen: “Language becomes a global product available in different local flavours The dissemination of ‘global’ communicative norms and genres, like the dissemination of international languages, involves a one-way flow of expert knowledge from dominant to subaltern cultures” (Cameron, 2002: 70). A focus on communication skills may well entail the dissemination of American ways of speaking and the forms of communication, genre, and style of the dominant consumerist culture, which globalization is extending

worldwide (see **Intercultural Pragmatics and Communication**).

In *Empire*, Hardt and Negri (2000) draw together many threads from political, economic, and cultural theory and philosophy, and astutely unravel the role of communication in global social trends, and the ways in which language constitutes our universe and creates subjectivities. They reveal how the hegemonic power imposes or induces acceptance of its dominion. They show why it has been so important for the corporate world not only to dominate the media but also education, which is increasingly run to service the economy and to produce consumers rather than critical citizens. Linguistic dominance as such is not pursued in their book, and it is also largely neglected in social and political science. Linguistic imperialism, or linguistic dominance in the sense of the maintenance of injustice and inequality by means of language policies, is invariably connected to policies in commerce, science, international affairs, education, culture, and the media, all of which involve material resources and attitudes, and all of which evolve dynamically.

Pragmatics: Optimality Theory

H Zeevat, University of Amsterdam, Amsterdam, The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Optimality theory (OT) starts from the idea that the products of linguistic behavior are optimal with respect to a set of criteria for a certain task.

The products can be pronunciations, language expressions, recognitions (of pronounced words), understandings (of, e.g., sentences or moves), the corresponding tasks being pronouncing a word, expressing a thought, recognizing a word, and understanding the contribution of an utterance. An important insight here is that optimality need not imply a perfect fit to the criteria – something which would be impossible in the (frequent) case of conflicting criteria.

A typical theme in OT phonology and syntax is precisely the conflict between various criteria, such as those enforcing economy vs. those enforcing expressivity. A similar conflict in interpretation would be that between simplicity and stereotypicality on the one hand, and the need to interpret a given message completely and coherently on the other. These criteria are in conflict by their very nature and therefore, some of the criteria are (or may be) typically violated.

Criteria (such as constraints) can be implemented in neural nets, provided they are sufficiently simple (see **Constraint, Pragmatic**). The nets can be combined to select optimal solutions. In OT, the combination is done by ranking the constraints and by settling the competition between candidates by giving full priority to the highest-ranking criterion. A candidate loses out to another candidate if there is a highest ranked constraint on which it does worse, while both candidates do equally well on all constraints that are ranked higher.

The simplest view on criteria is that there is a single set of criteria applying to all languages; on this view, the criteria basically belong to the psychological conditions of the tasks involved in speaking and understanding human language. Language production is made easier if one uses shorter, less complicated structures, whereas understanding is improved by the use of longer, more complicated structures. But since production should make understanding possible, production must produce enough structure to allow understanding. This idea is at the basis of an OT-oriented typology of languages, which assumes that all human languages have the same constraints and only differ in their ranking of these constraints).

Optimality Theory and Pragmatics

Pragmatics is an obvious area of application for OT. For instance, Grice's well-known conversational maxims are naturally understood as a set of criteria on utterances; as is likewise known from the pragmatics literature, such criteria maybe violated (see Grice, Herbert Paul; Neo-Gricean Pragmatics; Maxims and Flouting). Conflicts of this kind are natural, since, for example, it is impossible to give all the information that is required (by the maxim of quantity) and be maximally brief (as required by the maxim of manner). Treatments of presupposition tend to be formulated in terms of preferences or defaults to get correct (or more correct) solutions to the projection problem (see **Pragmatic Presupposition**). In relevance theory, the aim of the hearer is to maximize the relevance of the interpretation, another optimizing problem (see **Relevance Theory**).

Discourse coherence is often treated as a matter of degree, but, again, maximizing coherence in discourse interpretation is matter of enhancing optimality.

When we look at more specific tasks such as pronoun resolution, recognizing information structure, choosing between different readings of an expression, or deciding on the rhetorical relations prevalent in a piece of text, it turns out that most of the suggested solutions to these problems rely on defaults and heuristics. Being able to reduce all of these phenomena to a small set of simple optimality-theoretical constraints would carry with it a big descriptive and theoretical gain. In addition to the possibility of simplifying and unifying pragmatics, this would also provide more insight into the psychology of the pragmatic component of the grammar, and furthermore offer the perspective of efficient implementation of some important building blocks of future dialogue systems.

It is currently hard to see where a program of this kind would lead to, or, indeed, whether it is possible at all. In an OT perspective, pragmatics has a special status. First of all, it is often impossible to state constraints that are equally meaningful for the production and for the interpretation of a text, as the two processes move in opposite directions. This may have something to do with the tradition that thinks of pragmatics as an interpretive theory: interpretation follows a process of semantic interpretation, presumably realized by compositional means (see Frege, Friedrich Ludwig Gottlob). Even though this approach is less popular nowadays (a semantics that operates independently of pragmatics becoming more and more problematic), in many areas of pragmatics it is still the preferred view: a path leading from form to interpretation. For example, the constraint that prefers to interpret a 'presupposition trigger' (see **Pragmatic Presupposition**) by identifying the presupposition with the content already present in the context (by way of resolution), rather than adding the presupposition to the content, as new material (by way of accommodation) does not put any restrictions on the form of the utterance (or on its relation to the input). Presupposition triggers seem to function just as adequately in a resolution as in an accommodation approach; the intended effect is the same in both cases.

In all these respects, OT pragmatics is quite different from OT phonology and OT syntax, which are both dominated by constraints on form. Perhaps even more important is the fact that there is no indication that pragmatic constraints need to be differently ranked to account for different languages. For this reason, pragmatics may continue to be called a universal discipline, in accordance with the requirements of a typological classification of languages.

An important exception here is the class of pragmatically relevant items in a language. These can be certain kinds of anaphoric pronouns (including semantically empty, purely morphological agreement-type anaphors; *see Deixis and Anaphora: Pragmatic Approaches*); the different ways in which coherent discourse structure is built up; the kind of particles and modal verbs that a language disposes of; or the aspectual distinctions that can be made in a particular language. These factors have an important influence on the interpretation of different kinds of morphological items such as pronouns; on how we infer the existence and nature of discourse relations; on the various ways of expressing politeness; and on the central pragmatic issue of conversational implicature (*see Politeness; Implicature*).

The exception makes it necessary to consider both production and interpretation (cf. above). An important hypothesis here is that of ‘bidirectionality,’ originally put forward by Smolensky (1996) as the simple claim that there is a single system of constraints that operates in both directions, production and interpretation; however, since the candidates are at one time the set of possible forms, but at another time the set of possible interpretations, they compete in different venues. A form–meaning pair is strongly superoptimal if and only if, in their respective competitions, the meaning makes the form win and the form makes the meaning win. Limiting oneself to cases of superoptimal production and interpretation, one may end up with a system where forms lack a meaning (because all meanings are better expressed by other forms) and meanings cannot be expressed (because all forms have better meanings). A famous example is due to McCawley (1978), who observed that, whereas the unmarked sentence (1a) below can be used to express standard ways of murdering the sheriff, the marked form (1b) forces the interpretation that the murder was unusual (e.g., Bart killed him by plugging the barrel of his gun, thus causing the gun to explode).

(1a) Black Bart killed the sheriff.

(1b) Black Bart caused the sheriff to die.

Under ‘strong superoptimality,’ (1a) indeed pairs with the interpretation ‘simple killing,’ whereas (1b) cannot be used: it always (for reasons of economy) loses out to (1a) in the production competition, just as it always (again, for reasons of economy) loses out in the interpretation competition to the stereotypical meaning associated with (1a). This situation caused Blutner (2001) to propose an alternative, called ‘weak superoptimality,’ where a form–meaning pair is disqualified only if it loses out to another weakly superoptimal pair. In the example, (1a) does not lose

out to any competitors, so it is (at least) weakly superoptimal. In contrast, neither (1a) with the nonstandard meaning, nor (1b) with the standard meaning, are (weakly or strongly) superoptimal: both lose out when competing with the superoptimal (1a) with the standard, nonmarked meaning. That makes (1b) with the marked meaning weakly superoptimal. Weak bidirectionality is thus able to associate marked meanings with marked forms and unmarked meanings with unmarked forms, and in this way seems able to provide an explanation of the phenomenon of iconicity (*see Iconicity*).

Bidirectionality is a near-straightforward formalization of Grice’s theory of meaning, according to which successful communication rests on the speaker’s grasping the hearer’s intention and vice versa: the speaker needs to take the hearer’s point of view in deciding what signal to produce, and the hearer needs to take the speaker’s point of view in deciding what intention to attribute to the speaker. Bidirectionality has a similar direct relationship to the neo-Gricean reconstructions of Horn (1984) and Levinson (2000) (*see Neo-Gricean Pragmatics*); it is therefore not surprising that one of the areas in which the bidirectionality hypothesis holds out promises of success is precisely pragmatics.

As to the part played by the bidirectionality hypothesis in language description, there are some serious problems with both strong and weak bidirectionality (an overview is found in Beaver and Lee, 2003). Other bidirectional phenomena can be understood as conventionalizations arising in language evolution; often, bidirectionality is reduced to a role in the simulation of language evolution.

Pronouns

A first optimality-theoretical study on pronouns is Bresnan’s (2001) exploration of pronominal typology. Reduced realizations such as weak and clitic pronouns or agreement markers (bound or zero pronouns) represent the typologically marked case, whereas the full pronoun is typologically unmarked. Reduced pronouns associate with topical antecedents, full forms with nontopical antecedents. Beaver (2004) explored the potential of OT in pronoun resolution, or the task of finding the correct antecedent for pronouns. An influential and well-studied computational linguistic approach to this problem is the model called ‘centering’ (Grosz *et al.*, 1985 is the original source; for a recent, much changed version, see Strube and Hahn, 1999). Beaver (2004), using a small system of constraints, provided a faithful reconstruction of the centering algorithm and

shows that a form of restricted bidirectionality must be assumed so that the resulting system may also be successful in the production direction. Another attempt at finding an optimal pronoun resolution algorithm (not restricted to a reconstruction of the centering algorithm) is due to Bouma (2003). Mattausch (2003) gave a reconstruction of the complementary distribution of pronouns and reflexives in the development of English and was able to use the method of evolutionary OT developed by Jaeger (2003) to reconstruct the various stages the English reflexive system passed through before reaching its modern form.

Presupposition

In their study of the German particle *wieder* ('again'), Blutner and Jaeger (1999) gave a quite simple and convincing OT-based reconstruction of the presupposition theory as formulated by Van der Sandt (1992) and Heim (1983). In either theory, there are two defaults or preferences. The first preference in both theories is to identify the induced presupposition in the context of the utterance; this is called resolution. The second default prefers to add the presupposition either to the global context (Heim) or to the highest accessible context, wherever this is possible (Van der Sandt); this is called accommodation. The reconstruction has the following steps: Consistence > Resolve > Do Not Accommodate > Strength. Consistence stipulates that the current utterance does not conflict with what is known already. Resolve asks for the presence of the presupposed information at an accessible position. Do Not Accommodate forbids the addition of the presupposed information, while Strength excludes interpretations that are informationally weaker than the ones already available.

The reconstruction in the OT system improves in several ways on the earlier theories. Do Not Accommodate prefers partial resolutions to full accommodations; it does not outlaw copying presuppositions. Strength often gives a better prediction of the accommodation site than is the case in Van der Sandt's (1992) original theory. In particular, Zeevat's (2002) reconstruction allows for the exploration of particles such as *too* and their exceptional behavior in accounts of presupposition: they do not allow (full) accommodation and are obligatory in the contexts where they occur. In order to explain the latter phenomenon, one needs a 'max(F) constraint' (similar to that known from OT phonology): certain contextual relations are obligatorily marked. By contrast, the other phenomenon seems to allow for a bidirectional explanation: Do Not Accommodate, in a bidirectional interpretation,

excludes candidate expressions that force accommodations, whenever there is a simple alternative that means the same and does not force the accommodation. In the case of particles, the sentence without the particle is always such an alternative.

The Future

Pragmatics offers a rich field for potential developments in OT. Among the possible areas for optimization one could mention the intonational phenomena studied by Blutner (2001), De Hoop (2003), and Hendriks (2003); here, much remains to be done. Another area that is waiting for an OT treatment is that of discourse structure and discourse relations. The work done by Asher and Lascarides (2003), using a mixture of optimization and default logic, would benefit from the relative simplicity of the OT architecture. Very few people have so far tried to address implicatures and explicatures in this framework; explorations by Blutner (2001) and Krifka (2002) are quite promising, though. An important new strand of research is the investigation of language change by evolutionary simulation, based on systems of OT constraints. The reconstruction of pragmatics along the lines of bidirectionality is the central concept in these endeavors, which focus on an investigation of how systems reach stability under 'pragmatic pressure.'

The phenomena investigated so far have been relatively simple, though of fundamental importance. In a wider perspective, one may hope that some day, we may be able to account for the peculiarities of human language as they arise in linguistic evolution under the influence of pragmatic pressure. Such results may still be far away, but the investigation of pragmatic problems in the light of optimality theory has laid some of the groundwork for this enterprise.

Pragmatics: Overview

J L Mey, University of Southern Denmark, Odense, Denmark

Introduction

Traditionally, pragmatics has been considered as forming a triad with syntax and semantics (a partition originally ascribed to Charles Morris, and inspired by ideas from the philosopher Charles S. Peirce). (*See Morris, Charles; Peirce, Charles Sanders*). Here, syntax is considered to be the study of the formal relations of one sign to another, while semantics studies the relations of signs to objects in the outside world. Finally, pragmatics is thought of as the relation of signs to those who interpret the signs, the users of language (Morris, 1938: 6). It is the latter part of Morris' definition that will be the guiding point of this article; however, the original restriction to signs will be relaxed, such that we now speak of communication in a

very broad sense, also including nonverbal means such as gestures and body movements. The emphasis of this modern study of pragmatics is, as it was for Morris, on the user; however, the user is not thought of here as an isolated individual, but as a social animal in the Aristotelian sense: a being that is dependent on the context in which she or he lives, but at the same time is able to interact with and change that context through the use of signs – read: human language and other human communicative means.

Understanding and Misunderstanding

People talk in order to communicate. Good communication happens when speakers understand each other correctly, that is, in accordance with what the speaker means and the hearer understands the speaker to mean. When such an understanding does not occur, the communicative situation becomes one of misunderstanding rather than of understanding.

Many people (including most linguists) believe that communication, and hence understanding, depends solely on the words spoken. The famous reply to a journalist's question, "Read my lips," attributed to former U.S. President George H. W. Bush, expresses a belief in the validity of the verbal utterance as proffered by a speaker, without regard either to what the speaker may have had in mind or to the actual circumstances of the speaking and reading.

Another widespread error is made by people who believe that human communication should obey (or actually obeys) the rules embodied in what is usually called grammar (by many linguists interpreted as "a device that will generate all the correct sentences of a language, and no incorrect ones," as Noam Chomsky and his followers have preached ever since 1957, the year in which Chomsky's first and very successful treatise on syntactic structures appeared; Chomsky, 1957). This assumption (which has survived in a number of avatars, also among nonlinguists) was publicly denounced as a fallacy soon after its first public appearance; celebrated linguists such as Archibald Hill, anthropologists such as Dell Hymes, and sociologists such as Erving Goffman all were quick to point out that human communication very rarely proceeds in accordance with the strict rules of grammar. Pronouncing a correct sentence belongs in the realm of the impossible, not to say pure fantasy: real people speak in ways that are rather far away from the strictures of the grammarians, yet they are often, if not always, understood correctly (in the sense in which I used this word above).

But what happens when misunderstandings occur? What are the reasons for people's wrong apprehensions of their interlocutors' utterances? Is it the case that they do not understand the words that are spoken? Or are there deeper reasons for misunderstanding?

While it is true that understanding a message to some degree depends on a correct interpretation of the words being used, as well as on a certain respect for the usual form these words and their combinations take in any given language (not to speak of a pronunciation that is not prone to being perceived wrongly, or not at all), it remains the case that words, no matter how well chosen and correctly joined and pronounced, do not convey the entire message, or even the major portion of what we intend to say. Popular handbooks of communication and advertising often propagate the slogan that in business, the words count for 5%, the body language for the remaining 95% of your message. While this may be somewhat of an exaggeration, the point these business communication experts want to make is clear: words taken by themselves will not do the job; understanding a message is more than a verbal matter.

The French philosopher Jacques Rancière (1995) distinguishes between a simple misunderstanding (French: *malentendu*, or *méconnaissance*, i.e., a wrong understanding, or even a lack of understanding) and a misunderstanding on a deeper level (French: *mésentente*), where understanding is not only difficult, but even impossible, because there is not, and cannot be, any common platform where all the involved parties can meet. According to Rancière, this is the usual, unfortunate situation especially in politics (1995: 12–13); but also in daily life, it frequently happens that one person does not understand what the other is saying, not because the words are not clear or the phrasing ambiguous, but simply because the one interlocutor does not see what the other is talking about, or because she or he interprets that which the other is talking about as something entirely different. In Rancière's words,

The cases of misunderstanding are those in which the dispute on "what speaking means" [an allusion to the seminal work by the French sociologist Pierre Bourdieu, *Ce que parler veut dire*; 1982] constitutes the very rationality of the speech situation. In that situation, the interlocutors both do and do not mean the same thing by the same words. There are all sorts of reasons why a certain person X understands, and yet does not understand, another person Y: because, while he perceives clearly what the other tells him, he also does not see the object of which the other speaks to him; or even, because he understands, and must understand, sees and wants to make seen, another object represented by the same words, another reasoning contained in the same argument (Rancière 1995: 13; my translation and emphasis).

It is the task of pragmatics to clarify for us what it means to 'see and not to see' an object of which the 'same words' are being used, yet are understood in different, even deeply diverging ways. Notable examples of this '(mis-)use' are found in political discourse, the very subject of Rancière's reflections: words such as 'freedom,' 'democracy,' 'peace,' and so on have over the ages been consistently and willfully misunderstood and misused in political discourse. The deeper reason for such misunderstandings is not in what the words mean (and certainly not what they originally may have meant; here, the Greek roots of the word 'democracy' and its original meaning of 'people power' provide a sad example). The way we understand a word has to do with the situation in which it is being used, and that means: a situation where speakers and hearers engage in a 'common scene' (Rancière's expression) where they meet and discuss, respecting each other's background and underlying assumptions about what exactly is common to them as actors on that scene, in a particular situation of language use.

Situations and Contexts

A situation can be roughly described as a meeting of human interactants having a common background and trying to realize a common goal. Exactly how common those backgrounds and goals are can be the subject of much dispute, and even seemingly insignificant details may generate heated controversy (such as the seating order at a conference table; enter the round table, which minimizes to a certain degree problems of seating and precedence). The situation also comprises the various real world circumstances that either have occasioned the meeting or are material in creating its context. More broadly speaking, the notion of context may be taken as comprising all the circumstances that go into defining the backgrounds and goals of the interactants, including what has been, and is being, and possibly will be, said at a meeting. More narrowly, we may concentrate on the verbal part of the meeting and the immediate environment of the words spoken, and talk of cotext, rather than context; I will use the broader term here (see **Context, Communicative**).

A situational context is not just a listing of what is there and who are there: it must take into account where they, the interactants, come from, in more than one sense of the term. The background from which the interactants act and speak is decisive for their possibilities of interacting (in political meetings, this is often captured by the term ‘mandate’). Moreover, a context is not just given once and for all: it is a dynamic notion in that it constantly adjusts itself to the new developments in the interaction, seen against the original background (which may then be changed itself, and a new mandate given). What people bring to the situation in the guise of presuppositions and expectations is an important, albeit often not too visible part of the context. Nevertheless, and precisely because it is not directly observable, this hidden context plays a major role in determining the possibilities and liabilities of the interactants. It would be a mistake, however, to think that bringing such presuppositions out in the open automatically furthers successful interaction; in many situations, e.g., in business transactions, the interlocutors play their cards close to their chests and rely on the tacit understanding of their backgrounds that the others hopefully have, or at least pretend to have (see **Pragmatic Presupposition**).

Most importantly, all situations are subject to major world constraints, which govern the interactants and keep them in line, so to speak. There are both written and unwritten rules for what can be said and done and what cannot be said or done in a situation; these rules of the game depend on the way the

situation is incorporated into a larger political and social frame (e.g., labor negotiations have to abide by certain rules limiting the length of the negotiating period or the extent to which existing agreements can be changed or renounced). The power that resides in the individual interlocutors (e.g., to strike a deal, to call off a strike or lockout, to conclude an accord, and so on) is vested in them on account of their social and commercial position. An interlocutor speaks not only with his or her own voice, but repeats, or re-sounds, the Voice of the Master, i.e., the institution to which he or she belongs.
